MINNESOTA MEDICINE

Journal of the Minnesota State Medical Association, Southern Minnesota Medical Association, Northern Minnesota Medical Association, Minnesota Academy of Medicine, and Minneapolis Surgical Society

Owned and Published by
THE MINNESOTA STATE MEDICAL ASSOCIATION
Under the Direction of Its

EDITING AND PUBLISHING COMMITTEE

E. M. Hammes, M.D., St. Paul
Philip F. Donohue, M.D., St. Paul
H. W. Meyerding, M.D., Rochester
B. O. Mork, Jr., M.D., Minneapolis
C. L. Oppegaard, M.D., Crookston
T. A. Peppard, M.D., Minneapolis
H. A. Roust, M.D., Montevideo
O. W. Rowe, M.D., Duluth
Henry L. Ulrich, M.D., Minneapolis
A. H. Wells, M.D., Duluth

EDITOR
Carl B. Drake, M.D., Saint Paul

ASSOCIATE EDITORS
George Earl, M.D., Saint Paul
Henry L. Ulrich, M.D., Minneapolis

VOLUME 33

JANUARY—DECEMBER, 1950

EDITORIAL AND BUSINESS OFFICES
2642 University Avenue - - - - - - - - - - - - - Saint Paul 4, Minn.
BUSINESS MANAGER
J. R. Bruce

Copyrighted 1950, by the
Minnesota State Medical Association

Index to Volume 33

A

Abdomen, Acute conditions of the, 1133
Abdominal operations, thoracic and upper, Controlled respiration in, 1031
Abscess, liver, Solitary pyogenic, 588
Acute conditions of the abdomen, 1133
Acute inversion of the uterus, 700
Acute yellow atrophy of the liver from SH virus transmitted by a blood bank, 1211
Adrenocorticotropic hormone, Pituitary (ACTH) in asthma, 797
Advantages and limitations of the quantitative VDRL slide test, 573
Aged and chronically ill, Challenging problems and demands of the, 450
Alcoholism, "Antabuse" (tetraethylthiuram disulfide) in the treatment of, 1200
Alexander, H. A.: Fundamental principles in the treatment of varicose veins, 626
Allergies, Respiratory, in children, 893
Amerongen, Werner W., Manlove, Charles H., and Rea, Charles E.: Banti's disease, 347
Analysis of 10,000 appendectomies, 46
Anderson, David P.: An appraisal of major surgery in a small hospital, 31
Aneurysm, Dissecting, of the aorta, 255
"Antabuse" (tetraethylthiuram disulfide) in the treatment of alcoholism, 1200
Aorta, Dissecting aneurysm of the, 255
Aorta, thoracic, Hypoplasia of, clinically simulating coarctation, 1193
Appendectomies, 10,000, Analysis of, 46
Appraisal of major surgery in a small hospital, An, 31
Arnold, Ann W.: Hemolytic transfusion reaction in obstetrics, 597
Associated diseases of the skin and eye, 147
Asthma, Pituitary adrenocorticotropic hormone (ACTH) in, 797
Asthmaticus, status, The management of, 983
Ataxia, Friedreich's, The heart in, 1000
Atelectasis, Ciliary action and, 1009
Atomic weapons, The radioactive effects of, 1085
Auricular fibrillation, Treatment of, from the standpoint of the general practitioner, 1196

B

Back pain, low, Subfascial fat abnormalities and, 593
Bacon, Harry E., Sherman, Lloyd F., and Campbell, William N.: Hemangiopericytoma, 683
Banti's disease, 347
Barbiturate poisoning, Treatment of, with metrazol (case report), 370
Baronofsky, I. D.: Some recent aspects of cardiac and juxta-cardiac surgery, 339
Baronofsky, Ivan D., and Briggs, John F.: Surgical treatment of mitral heart disease, 881
Baronofsky, Ivan D., Dickman, Roy W., and Vanderhoof, Edward S.: The treatment of acute chest injuries, 49
Baronofsky, Ivan D., Ferrin, Allan L., and Briggs, John F.: Hypoplasia of thoracic aorta clinically simulating coarctation, 1193
Bauer, Henry, and Kimball, Anne C.: Advantages and limitations of the quantitative VDRL slide test, 573
Behmler, F. W.: Health—an international as well as local problem, 1088
Benign tumors, nevi and precanceroses, 908
Berylliosis, 904
Better rural transfusion program, A, 773
Blood bank, Acute yellow atrophy of the liver from SH virus transmitted by a, 1211
Blood transfusions, The rationale of, in the treatment of the true toxemias of pregnancy, 39
Blumenthal, J. S.: Dissecting aneurysm of the aorta, 255
Blumenthal, J. S.: Pituitary adrenocorticotropic hormone (ACTH) in asthma, 797
Borgerson, A. H.: A better rural transfusion program, 773
Bowel, large, Cancer of the, 897
Briggs, John Francis: The pulmonary mimicry in bronchogenic carcinoma, 82
Briggs, John F., and Baronofsky, Ivan D.: Surgical treatment of mitral heart disease, 881
Briggs, John F., Baronofsky, Ivan D., and Ferrin, Allan L.: Hypoplasia of thoracic aorta clinically simulating coarctation, 1193
Brower, J. W., and Rosenfield, A. B.: Progress in maternal and infant health in Minnesota, 582
Brucellosis in Minnesota, Studies on, 333
Brucellosis, Milk-borne, in Minnesota, 981
Burch, Edward P., and Freeman, Charles D.: Associated diseases of the skin and eye, 147

C

Campbell, William N., Bacon, Harry E., and Sherman, Lloyd F.: Hemangiopericytoma, 683
Cancer of the large bowel, 897
Cancer statistical research service, 1948, Results of the, 42
Cancer statistical study, The 1949, 782
Carcinoma, bronchogenic, The pulmonary mimicry in, 82
Cardiac and juxta-cardiac surgery, Some recent aspects of, 339
Cardiac deaths, Syphilitic, in over fifty thousand deaths, 437
Cardiovascular disease, hypertensive, Review of 250 necropsy cases of, 441
Carr, David T., Seybold, William D., Schmidt, Herbert W., and Karlson, Alfred G.: Intravenous administration of para-aminosalicylic acid for streptomycin-resistant tuberculosis of the trachea, 363
Challenging problems and demands of the aged and chronically ill, 450
Chapman, Carleton B., and Hammersten, James F.: Spontaneous remission in subacute leukemia, 259
Chest injuries, acute, The treatment of, 49
Childhood, The common hemorrhagic diseases of, 1098
Children, Respiratory allergies in, 893
Chorionepithelioma, Placental polyp simulating a, 601
Chronically ill, The emotional problems of the, 673
Chronic leukemic infiltration of the gastric wall simulating peptic ulcer, 1004
Ciliary action and atelectasis, 1009
Clawson, B. J.: Syphilitic cardiac deaths in over fifty thousand autopsies, 437
Clinical application of quantitative reports of serologic tests for syphilis, The, 579
Clinical detection of pulmonary emphysema from respiratory tracings, 889
Clinical observations of experiments of nature, 685
Coarctation, Hypoplasia of thoracic aorta clinically simulating, 1193
Cole, Wallace: Treatment of fractures with the intramedullary nail (discussion only), 821
Common hemorrhagic diseases of childhood, The, 1098
Common injuries of the knee joint, 1217
Compression fractures of the spinal column, 154
Conley, Robert H.: Treatment of auricular fibrillation from the standpoint of the general practitioner, 1196
Conley, Robert H., and Wilson, J. Allen: Chronic leukemic infiltration of the gastric wall simulating peptic ulcer, 1004
Controlled respiration in thoracic and upper abdominal operations, 1031
Coronary thrombosis, The prediction and prevention of, in the younger age groups, 999
Cortical hyperostosis, Infantile (case report), 1113
Coventry, Mark B.: Flatfoot, with special consideration of tarsal coalition, 1091
Cranio-cerebral injuries, Neuropsychiatric and laboratory observations in 147 patients following, 233
Creevy, Donald: Current mortality of transurethral resections (abstract), 820
Culligan, Leo C.: Problems in acute intestinal obstruction, 1136
Culligan, John A., and Culligan, John M.: The present status of surgery of the spleen, 1245
Culligan, John M., and Culligan, John A.: The present status of surgery of the spleen, 1245
Current mortality of transurethral resections (abstract), 820

Clinical-Pathological Conferences

Diagnostic case study (homologous serum hepatitis), 163
Diagnostic case study (suppurative arthritis), 266

Communications

American Cyanamid Company (Parathion poisoning), 1934

D

Deafness, Treatment of, with histamine, 157
Depropanex in post-surgery, 1102
Dickman, Roy W., Vanderhoof, Edward S., and Baronofsky, Ivan D.: The treatment of acute chest injuries, 49

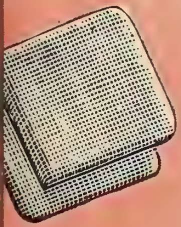
In 478 cases of anorectal surgery—fissures, hemorrhoids and fistulas—OXYCEL proved an outstandingly effective hemostatic agent. Not a single instance of postoperative hemorrhage occurred and secondary hemorrhage due to removal of gauze or rubber drains was eliminated. Healing progressed satisfactorily and patients experienced a more comfortable postoperative course.

Absorbable and promptly hemostatic, OXYCEL is convenient to use since it is applied directly from the container to bleeding surfaces. To aid the surgeon in stopping bleeding not controllable by clamp or ligature, OXYCEL is available in forms adaptable to many uses.

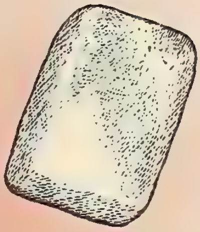
PACKAGE INFORMATION:

OXYCEL is supplied in individual screw-capped bottles.



OXYCEL PADS

(Gauze Type) Sterile
3″ x 3″ eight-ply pads.

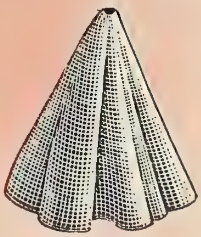


OXYCEL PLEDGETS

(Cotton Type) Sterile
2¼″ x 1″ x 1″ portions.

OXYCEL STRIPS

(Gauze Type) Sterile
18″ x 2″ four-ply strips,
pleated in accordion fashion.



OXYCEL FOLEY CONES

Sterile four-ply gauze-type
discs of 5″ or 7″ diameter
folded in radially fluted form,
used in prostatectomy.

MEDICAMENTA VERA

Look at Your Income This Way

You can't lock it up in a vault to protect it. Yet it is more important than any personal property that you may own, and if anything should happen to it, you would stand to lose plenty.

It is logical that this plan of your Association, using its buying power, can do more for you than any individually purchased policy. Mute testimony for that point is the many professional organizations that have investigated and tested this special plan of disability insurance.

You can't eat accident and sickness insurance, but it will certainly keep you from starving.

DELAY offers no advantage—CALL US NOW!

In the City of Bagdad lived Hakeem, the Wise One, and many people went to him for counsel, which he gave freely to all, asking nothing in return.

There came to him a young man, who had spent much but got little, and said: "Tell me, Wise One, what shall I do to receive the most for that which I spend?"

Hakeem answered: "A thing that is bought or sold has no value unless it contains that which cannot be bought or sold. Look for the Priceless Ingredient."

"But what is this Priceless Ingredient?" asked the young man.

Spoke then the Wise One: "My son, the Priceless Ingredient of every product in the marketplace is the Honor and Integrity of him who makes it. Consider his name before you buy."

What's Behind an Ampoule?

A FORMULA, a couple of machines and a label?
. . . That's about it—for *just any* ampoule.

But the careful physician won't settle for just any product—ampoule or otherwise. When he prescribes, he wants the label to signify—beyond the shadow of a doubt—a clean manufacturing record, preferably one stretching back a generation or more; unfailing adherence to controls; a research program with adequate staff and facilities; and for final confirmation, a place on the roster of Council accepted products.

You need settle for nothing less when you specify medication labeled

1 ONLY SIMILAC IS NEEDED

whenever possible . . .

BREAST FEEDING

as long as possible . . .

or

SIMILAC

so similar to human breast milk that there is no closer

equivalent

1. SAVES TIME AND MONEY—one can of Similac supplies 116-oz. of formula—20 calories an ounce at an average cost of less than 9/10ths of a cent per ounce.

2. SAVES TIME AND MONEY—no milk modifiers needed with Similac; its higher vitamin content must be considered; helps avoid costly complications of ordinary formula feedings.

3. SAVES TIME AND MONEY—easily prescribed, easily prepared—simply 1 measure of Similac to 2 oz. of water.

SIMILAC FOR GREATER INFANT FEEDING VALUES

2 BABIES THRIVE ON EASILY DIGESTED SIMILAC WITH ITS ZERO CURD TENSION

3 SAVES YOU TIME

COLUMBUS 16, OHIO

WANGENSTEEN SUCTION SYSTEM

by PHELAN

DESCRIPTION Height 26 inches, diameter 15 inches. Weight approximately 35 pounds. Mounted on four Bassick casters.

The tank is hollow with a crowned head and inverted bottom. It is made of 16 gauge steel of welded and brazed construction throughout and finished in hammered aluminum lacquer, baked for durability.

On the top of the tank is a vacuum gauge reading in inches of mercury, a needle valve, a pump handle and a handle for moving the piece. IV tubing connects the tank to the drainage bottle.

SOME OF ITS USES

Decompression and drainage of stomach by connecting to nasal tube.

Gastrostomy decompression by connecting to gastrostomy tube.

Enterostomy decompression by connecting to enterostomy tube.

Aseptic decompression of bowel.

Withdrawal of blood in exchange transfusions.

ADVANTAGES

Silent in operation.
Safe for patient—no water used—patient's stomach cannot be flooded.
Impossible to develop positive pressure or excessive negative pressure.
Complete—requires no electrical or power connections.
A device requiring a minimum of attention—a time saver.
Easily portable—requires a minimum of space.
Economical—saving bottle replacements, etc.
Explosion proof.
In case drainage bottle is allowed to overflow, suction to the patient is not interrupted.
Hundreds of these units in use and not one request for service or replacement of parts.

WANGENSTEEN SUCTION SYSTEM — *BY PHELAN*

Your Patients...

And the Meat They Eat

The established relationship between sound dietary planning and a state of maintained good health emphasizes the nutritional importance of meat, man's favorite protein food.

Not only does meat taste good, but of greater significance, it provides a host of nutritional benefits. Developments in the field of nutrition* have proved that complete protein—the kind that meat supplies in abundance—aids in building and maintaining immunity, hastens recovery after acute infectious diseases and following injury and burns, promotes health during pregnancy, aids in the growth and development of husky children, and is needed to maintain everyone in top physical condition.

No matter from what walk of life your patients come, and whether their pocketbooks demand economy or permit satisfaction of that urge for the fanciest cuts, meat gives them full value for their money.

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association.

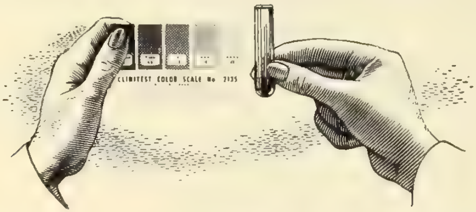
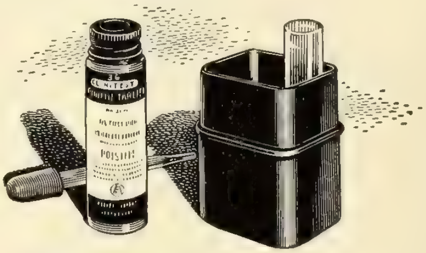
Detection must be early

Early vigorous treatment of diabetes increases the patient's chances for longevity. One million diabetics remain undetected in the United States.* The diabetic must be detected before it is "*too late.*" **Selftester**—for the general public, is a simple home test for the detection of urine-sugar. Its purpose is to help discover the hidden diabetic and bring him to the physician for adequate care.



Control must be complete

A well-controlled diabetic is less susceptible to infection and acidosis. The incidence of vascular complications, retinitis, gangrene, and renal intercapillary glomerulosclerosis is reduced with vigorous control. "*Too little*" is the symbol of inadequate control.



Clinitest for physician and patient

Clinitest (Brand) Reagent Tablets dispense with external heating and cumbersome laboratory apparatus in the detection of urine-sugar. The tablets provide a simple, rapid, inexpensive method for adequate diabetic control resting upon the cardinal principles of diet and insulin administration guided by the urine-sugar level.

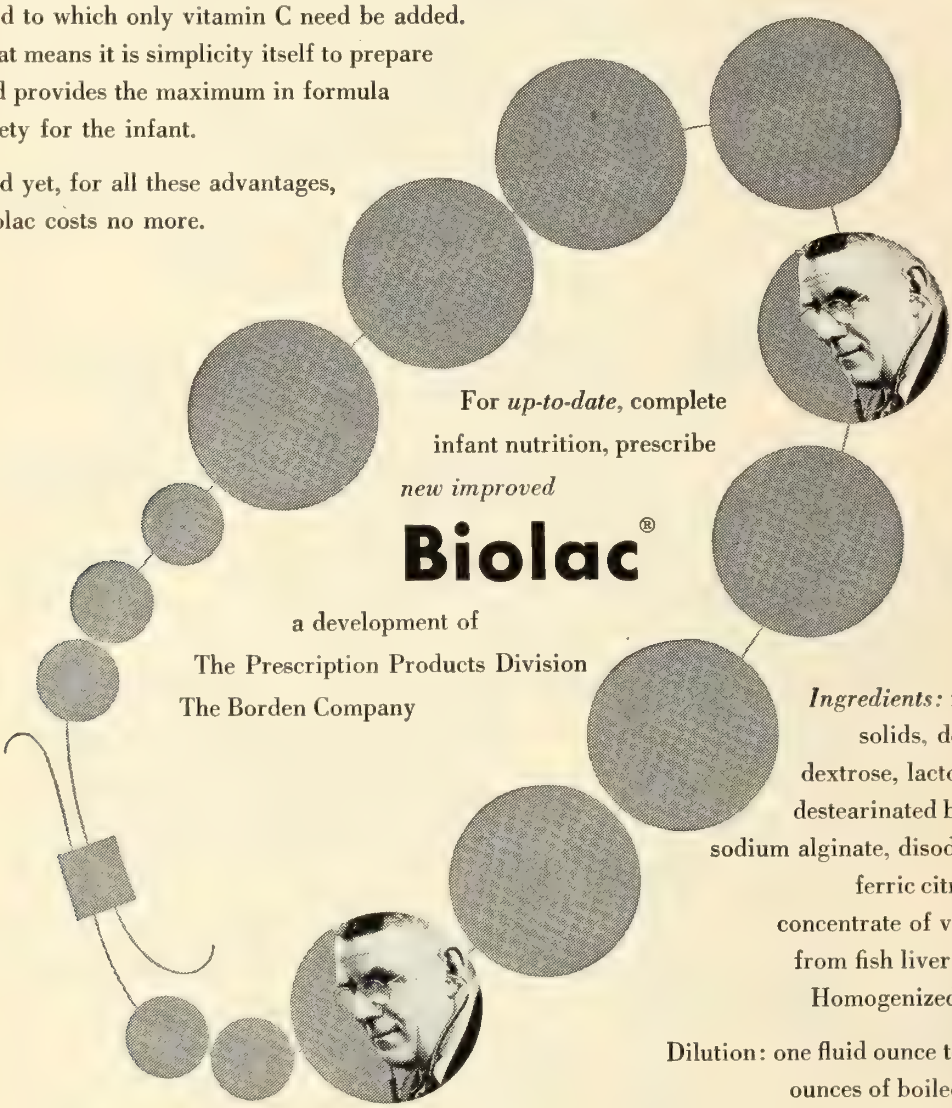
The development of the new improved Biolac supplies a long-sought need in infant nutrition. To accomplish this, Borden scientists surveyed our present nutritional knowledge. They then tested more than 500 formulations. Having decided on the formula that would best supply the normal infant's nutritional requirements in their most assimilable form, a modern plant was constructed in 1949 so that the new formula could also benefit from the most up-to-date techniques and control in processing equipment. A Biolac formula that is both new and improved is thus made available.

Biolac is intended for prescription by every physician with infants among his patients. It satisfies the physician's demand for a complete food to which only vitamin C need be added. That means it is simplicity itself to prepare and provides the maximum in formula safety for the infant.

And yet, for all these advantages, Biolac costs no more.



For *up-to-date*, complete infant nutrition, prescribe

SNOOZER PETE
is a Breakfast Cheat

Skip the morning repast? Not Pete. If he snoozes until 8:02, he can still make the 8:24 by a flying leap—with a few minutes at the other end for gulped coffee and a cigarette. Scanty breakfast? He'll make it up at lunch—if he has time.

Pete doesn't think he's a meal-cheater. Neither does the food faddist, the worrier, the reducing "expert" nor any of their kin likewise committed to dietary sin. Thus do they become prey to all the associated evils of subclinical vitamin deficiency.

When you examine the habit patterns of these patients, it's obvious that overnight dietary reform won't come easy. So isn't it wise to make use of the aid provided by vitamin supplementation?

Wise also to specify ABBOTT. You know there's a dependable ABBOTT vitamin product to serve nearly every vitamin need—for supplementary or therapeutic levels of dosage, for oral or parenteral administration. Your pharmacist can always supply fresh and potent ABBOTT vitamin products in a wide variety of attractive forms and package sizes. ABBOTT LABORATORIES, NORTH CHICAGO, ILL.

LIFE INSURANCE AND MEDICAL RESEARCH

HARRY E. UNGERLEIDER, M.D.
New York, New York

"THE BEST prophet naturally is the best guesser," wrote Thomas Hobbes a few centuries ago in *The Leviathan*, "and the best guesser, he that is most versed and studied in the matters he guesses at, for he hath most signes to guesse by."

We may adopt this terse quotation from Hobbes as a statement of the primary function of life insurance medicine. Unlike clinical medicine, which deals chiefly with problems of the present, insurance medicine is concerned to a greater degree with the remote future, specifically the life expectancy of the individual, and in this function the physician plays the role of prophet rather than healer. To a greater extent than in clinical medicine, one must necessarily rely more heavily on objective findings than on symptoms, and accordingly "signes to guesse by," to use Hobbes' phrase, assume considerable importance.

Some twenty years ago the Equitable Life Assurance Society of the United States installed a complete diagnostic laboratory as an adjunct to the examination of candidates for life insurance. I believe I can best illustrate our subject, "Life Insurance and Medical Research," by reviewing some of the activities of the diagnostic laboratory over the past two decades, for in this way we can review specific problems rather than discuss generalities.

Very soon after we began employment of the x-ray and electrocardiograph on a fairly broad scale, it became evident that precision apparatus does not necessarily supply precise information. This fallacy, unfortunately, still holds considerable sway in the domain of clinical medicine. The range of normal variation in almost all facets of the cardiovascular examination is very considerable. It became necessary to define standards of normality so that there would be a basis of reference in evaluating particular findings. Data derived from the study of patients in hospitals or private practice have obvious deficiencies in this respect. Observation of large groups of normal individuals studied in connection with applications for life insurance, on the other hand, provides an ideal opportunity to establish normal standards. Important contributions in such questions as standards of body build and blood pressure have been made through the co-operative efforts of the various insurance companies, under the Joint Committee of the Association of Life Insurance Medical Directors and Actuarial Society of America.

We first addressed our attention to the problem of heart size. It has long been an aphorism in cardiology that an enlarged heart is a diseased heart, but standards of heart size in the teleoroentgenogram were lacking until Dr. Charles Clark and I, in 1938, undertook a study of 1,460 individuals to establish standards for the transverse diameter of the heart based on weight and height.[24] In a subsequent study, standards were presented for the area of the frontal cardiac silhouette derived simply on a nomogram chart from measurement of the long and broad cardiac diameter.[25] On the same nomogram chart were like-

---

Presented at the Minnesota Society of Internal Medicine, Saint Paul, October 13, 1949.

Dr. Ungerleider is Medical Director of the Equitable Life Assurance Society of the United States.

wise presented the predicted transverse diameter of the heart and transverse diameter of the aortic arch silhouette, based on the Sheridan Index,[19] the utility of which we confirmed in a study of several hundred cases.[25] Employment of this nomogram chart makes possible the accurate detection of cardiac enlargement and aortic abnormality in very simple fashion. Measurements of the transverse diameter and of the frontal cardiac area up to 10 per cent above that predicted for weight and height are within allowable normal limits, but measurements exceeding this limit may be considered to indicate cardiac enlargement, since the distribution curve of normal values shows only a very small percentage or normal measurements above this range. Several clinical studies, such as those of Comeau and White,[3] Kurtz,[18] Gomez,[6] and pathological correlations by Sherman and Ducey,[22] have confirmed the value of these simple measurements of heart size, and these standards have achieved widespread application in clinical medicine as well as in the field of insurance. By way of illustrating the prognostic importance of cardiac enlargement, it may be mentioned that in subjects with an apical systolic murmur, the mortality among those with moderate cardiac hypertrophy is fully twice that of subjects whose hearts are not enlarged. The importance of recognizing cardiac enlargement is therefore clearly evident.

In hypertension, the presence of cardiac hypertrophy likewise is an extremely important prognostic consideration.[26] Serious complications, such as cardiac enlargement and decompensation, and arteriosclerotic changes in the coronary and cerebral vessels, are related more to the duration than to the degree of elevation of the blood pressure.[4] The presence of left ventricular hypertrophy provides a clue to the existence of elevated blood pressure of some duration. X-ray methods are not too satisfactory for the detection of early left ventricular hypertrophy, for hypertrophy, as such, is a matter of increase in thickness of the left ventricular myocardium of a few millimeters, and this change cannot be detected by any roentgenologic method. Accordingly, we undertook a study some years ago on a large group of subject studied in our diagnostic laboratory to establish specific electrocardiographic criteria of left ventricular hypertrophy and to compare the sensitivity of electrocardiographic versus x-ray methods in the detection of hypertrophy.[15] Briefly, we found the following to provide a good index of left ventricular hypertrophy:

1. An increase in voltage of the QRS complex best expressed as a sum of the R wave in lead I and the S wave in lead III. An amplitude of R1 plus S3 of 25 mm. or more is abnormal since 99 per cent of normal individuals with left axis deviation fall within this range. R1 exceeding 15 mm. is similarly indicative of left ventricular hypertrophy even in the absence of left axis deviation. This increase in voltage is the earliest sign of left ventricular hypertrophy.
2. Depression of the ST segment in lead I of any perceptible degree even as slight as one-half millimeter.
3. T wave changes in lead I.

Employing these criteria, it was found that the electrocardiogram provides the most sensitive index of left ventricular hypertrophy, more so than any roentgenologic method. In a mortality study carried out on 424 insurance applicants with hypertension, we found that in subjects with identical blood pressure readings, the mortality rate was twice as high when the electrocardiographic pattern of left ventricular hypertrophy was present as when the electrocardiogram was normal.[5] This study indicates that the stage of hypertensive disease, as determined by electrocardiographic evidence of left ventricular hypertrophy, is an important consideration in the evaluation of life expectancy. It is our practice to take electrocardiograms and teleoroentgenograms of the chest routinely when hypertension is present in candidates for life insurance. These procedures have helped greatly in appraising the selection of subjects with hypertension, and have made possible a more liberal policy in subjects with no evidence of cardiovascular disease, as well as helping to exclude unfavorable risks. Numerous other factors have important bearing on prognosis and life expectancy in hypertension, as we have discussed elsewhere. Particularly may be mentioned the rather benign course of hypertension in women as compared to men, which accords well with clinical experience.

Analysis of the extensive material available in our diagnostic laboratory has helped to establish criteria in evaluating two other frequent and important electrocardiographic abnormalities, i.e., extra systoles which are the most frequent of all arrhythmias, and the Q3 deflection.

In a study of 1,142 cases of extra systoles, several abormalities were found preponderantly in cases of organic heart disease.[27] Among these were: (1) the occurrence of premature beats of multi-focal origin; (2) frequent and persistent premature beats, particularly if they occur successively in short runs interrupting the regular rhythm; (3) a definite increase in the number, or a shower of extra systoles immediately following exercise; (4) occurrence of premature contractions and presence of a rapid heart beat; (5) inversion of the T wave in the regular beat which follows the extra systoles; (6) postextrasystolic pulsus alternans. In fully 58 per cent of subjects with premature beats, no objective evidence of heart disease whatsoever was found. The mere presence of extra systoles, therefore, is not to be regarded adversely, unless further examination discloses evidence of organic heart disease. However, since arrhythmias are frequently a clue to the presence of organic heart disease, it is good insurance medicine just as it is good clinical medicine to carry out a complete cardiovascular survey when an irregularity of a heart beat is detected on physical examination.

Few problems are more vexing to the cardiologist than the expression of a definite opinion of the significance of a Q3 deflection in the electrocardiogram in the absence of other signs of heart disease. A Q3 deflection may be the only residue of previous coronary occlusion, or may occur in perfectly normal individuals with transversely placed hearts; and in insurance selection particularly it is essential to make a clear-cut distinction if possible between these two groups. In a comparative analysis of two large groups, the first normal individuals with a Q3, and the second comprised of individuals on disability due to previous posterior wall infarction, certain signs were found to be helpful in distinguishing the normal from the pathological G3.[20] Any of the following electrocardiographic changes in conjunction with a Q3 denotes it to be of abnormal origin:

1. Absence of the S wave in lead I.
2. The presence of a Q wave in lead II exceeding one millimeter.
3. Flattening of the T wave in lead II below 1 mm. in amplitude.
4. Large amplitude of the Q wave in lead III where the Q wave exceeds 75 per cent of the amplitude of the tallest R wave in the limb lead.
5. A wide Q wave in lead III of at least 0.04 seconds in duration.
6. Deep inversion of the T wave in lead III exceeding 2.5 mm.
7. The presence of a sizable Q3 in individuals less than 5 per cent overweight.

The advent of unipolar limb leads has helped further in clarifying the significance of the Q3 deflection, a Q wave in the unipolar left leg lead indicating that the Q3 is abnormal. Recently, we have found that the presence of a Q wave in a unipolar lead taken over the left lumbar area posteriorly is even more sensitive than the unipolar left leg lead.

Another diagnostic procedure which has helped us greatly in insurance selection has been the roentgenkymogram, which records the pulsations of the heart and great vessels graphically on a single film. Roentgenkymograms are taken on all individuals studied in our laboratory above the age of forty. Abnormal pulsations along the left ventricular contour, of which the most significant is a reversal of pulsation or systolic expansion, occur in the majority of cases with previous attacks of coronary occlusion, and such changes in pulsation frequently are permanent.[13] On numerous occasions, we have found such abnormalities in the roentgenkymogram to provide the only clue to previous infarction, where the electrocardiogram was perfectly normal.

I have entered into a discussion of these diagnostic techniques at some length in order to delineate their sphere of usefulness in insurance selection. It has been necessary for us to establish specific criteria in the evaluation of these various signs. Clinical studies deal, by and large, with the grossly abnormal, whereas in insurance selection, one is confronted constantly with the normal and borderline, and this type of material lends itself very well to establishing standards of normality and abnormality. Apart from clinical applications, to which we shall presently refer, such research has shown its value abundantly in the field of insurance medicine. The more exact application of the various diagnostic procedures in cardiovascular disease has placed insurance selection on a much sounder scientific basis, making possible more equitable action, both to the insurance company and to the insured.

It is an important function of those engaged in insurance medicine to remain constantly abreast of advances in clinical medicine. By way of example may be cited the recent simplification of ballistocardiography by Dock, which promises to make this method a routine part of examination of the heart in clinical cardiology. In our brief experience with one of these instruments loaned to us by Dr. Dock, we have been much impressed by its potentialities. Almost the first case in which we employed it was one with a classic history of angina pectoris where examination otherwise, including an exercise electrocardiogram test of coronary insufficiency, was entirely negative. The ballistocardiogram shows a marked respiratory variation in wave form which has been described in cases of coronary artery disease by Starr[23] and more recently by Brown.[2] There appears to be no doubt that ballistocardiography is by far the most sensitive method for recording the mechanical activity of the heart. Considerable study remains to be done to establish normal standards in various age groups and proper technique for recording the ballistocardiogram. Here, too, with its large source of material in various age groups, insurance medicine can make a substantial contribution of value, not only in its own field but in clinical application as well. The determination of various biological standards is an important contribution by insurance medicine to the field of clinical medicine. The annual proceedings of the Association of Life Insurance Medical Directors of America are replete with contributions by the Medical Departments of the various American life insurance companies in such fields as glucose tolerance, blood pressure, heart murmurs, in addition to studies such as we have described in detail.

Research in insurance medicine cannot be carried out profitably within an ivory tower of statistics. Like other types of research, it must have free access to the various modalities of investigation. Dealing so closely with problems of a clinical nature, a close liaison particularly is necsary with clinical material. Many of our studies have been carried out through the kindness of Dr. William Dock, Professor of Medicine at the Long Island College of Medicine in its Kings County Hospital Division, where there is ample material for clinical study. A full-time Fellow in Medicine is maintained by the Equitable in the Department of Medicine of the Long Island College of Medicine to assist in problems under clinical investigation.

Several studies undertaken to resolve problems in insurance medicine have led us inevitably into the domain of clinical medicine. Thus, recognition of the inadequacy of casual blood pressure readings in life insurance examinations among subjects with elevated blood pressure led to the evolution of very simple pressor and depressor tests. The breath-holding test originally described by Ayman,[1] and the hyperventilation plus carotid sinus pressure test, both of which we have described in detail elsewhere,[7] were found to correspond very closely with the cold pressor and the sodium amytal depressor tests, respectively. Employment of these very simple procedures makes it possible to determine the ceiling and basal levels of blood pressure within a very few minutes, and lends itself very well to routine office use in clinical practice in studying subjects with hypertension. Another pertinent illustration was an analysis of several thousand arterial sphygmograms recorded in our diagnostic laboratory which led to a study of the mechanism of pulsus alternans.[8] In the fields of electrocardiography and roentgenology of the heart, we have found constantly that our activities have extended into the clinical sphere. We have summarized our various observations on these subjects in the section on roentgenology of the heart in Myers and McKinlay's book[21] and in an article entitled "Newer Aspects of Clinical Electrocardiography" which appeared last year in the *New York State Journal of Medicine*.[9]

As we have already mentioned, research frequently extends beyond the horizons within which it is originally conceived. While our own scope of activities has been primarily concerned with questions of prognosis and diagnosis, which relate naturally to clinical problems, our work has carried us into investigations of cardiac physiology, and into therapy as well. Thus, employing the technique of roentgenkymography, to which we have already referred, simultaneously with diodrast contrast visualization of the heart chambers, we have been enabled to make observations on the dynamics of the interventricular septum.[10] We have shown that far from being a passive partition between the two ventricles, the interventricular septum plays a very significant dynamic rôle as an integral part of the left ventricle in systolic ejection. In another physiololgical study, the principle of specific dynamic action was applied as a means of augmenting peripheral blood flow.[11] Glycine was used to augment heat production in the liver which was dissipated by an increase in blood flow to the extremities. These observations have been confirmed recently by Gustafson and his colleagues of the University of Michigan[18] who have indicated from extensive and extended experience with this simple amino acid that it is "a definite adjunct to the conservative treatment of peripheral vascular insufficiency."

Some of our studies have been directly in the field of therapy. For some time, we have been engaged in a project on the chemotherapy of tuberculosis. A new sulfone compound synthesized in our chemical laboratory has shown considerable promise in *in vitro* studies, and in experimental mouse tuberculosis experiments carried out in collaboration with Dr. Réné Dubos at the Rockefeller Institute for Medical Research.[12] More recently, in another series of tests, this work has been confirmed both in the mouse and in hamsters, and the drug was found to possess antituberculosis activity approximately twice that of para-aminosalicylic acid, and to be completely lacking in toxicity, both in acute and chronic toxicity studies. A study of its efficacy in man is now being undertaken.

Currently, we are actively engaged in studies on various aspects of arteriosclerosis. Some of you may be acquainted with our survey of arteriosclerosis which appeared in the *American Journal of Medicine* some months ago.[14] In a study we recently carried out on the significance of blood cholesterol, it was found that significantly less arteriosclerosis occurred in the subjects with a low level of blood cholesterol compared to those with so-called normal levels of cholesterol and with hypercholesterolemia.[28] These observations suggest that the so-called normal cholesterol is, in reality, a high cholesterol, and that the cholesterol level of the average American population is of such an order as to predispose to the development of arteriosclerosis. One of the difficulties in cholesterol studies has been obviated by the introduction by Kendall and his colleagues of a highly accurate method for determining its concentration in the serum,[17] a technique we are now employing in our laboratory. The prevention of arteriosclerosis is beyond question the Number 1 public health problem in the United States today. It will be of immense importance to establish whether, as our preliminary studies suggest, low levels of blood cholesterol confer protection against the development of arteriosclerosis, and if this is so, to find simple and effective means to maintain a low level of blood cholesterol.

I have tried to illustrate the subject of this talk on Life Insurance and Medical Research, by a description of our own research program at the Equitable Life Assurance Society of the United States, rather than to deal with this subject in generalities. In our own activities, we have had occasion to exploit the statistical material which is uniquely available to life insurance organizations, employing in our various studies data on ordinary life insurance and mortality experience, subjects receiving disability benefits, and our large group insurance coverage embracing large segments of the population in various industries. In addition, we have constantly utilized the facilities of our own diagnostic laboratory and chemical laboratory. During the war, our diagnostic laboratory served as a cardiac consultation station for the Naval Recruiting Bureau.[29] In other studies, we have employed the facilities of our hospital which provides medical service to our several thousand personnel. It has been our good fortune to maintain a close clinical liaison in our research program. Such varied facets of operation are very necessary, for research cannot be confined profitably within particular precincts, since it frequently leads in unexpected directions.

It must be apparent that life insurance has a very substantial interest in medical research and progress, for beyond the specific problems of insurance medicine, improvement in the health and longevity of the population is of vital concern to insurance. The need for fostering research has been recognized by the life insurance companies of the United States in the creation, in 1945, as a co-operative enterprise among the various companies, of the Life Insurance Medical Research Fund. This Fund makes available some two-thirds of a million dollars annually for fundamental research in cardiovascular disease. Under the guidance of a council composed of outstanding figures in American medicine, its work already has proven most fruitful. Several hundred publications have appeared regarding work which was aided by the Fund, and up to 1948 Grants-in-Aid had been given to 165 research programs and seventy-one Research Fellowships had been awarded. It is expected that this project will prove increasingly rewarding in its objectives of stimulating research in fundamental aspects of rheumatic fever, hypertension, arteriosclerosis and other cardiovascular disorders. The Equitable as well as other insurance companies has actively supported the programs of such organizations as the American Heart Association. As you can see, our Society has had a program of research for many years. The insurance companies should, and are, contributing to the sum total of our medical knowledge in an increasing degree. There is no doubt in my mind that other companies are making contributions similar to those outlined. Scientific knowledge, from whatever source, should be welcomed by the medical profession. We in insurance medicine feel that we are not apart from those who are actively engaged in clinical medicine. Our problems are the same, and although our approach may be different, the common goal we seek is the prolongation of human life.

LIVING CONDITIONS AND TUBERCULOSIS

The public welfare officer has long known that tuberculosis differs from other diseases affecting his clients because of the problem created in the patient's family even after the patient is out of the home. The worse the living conditions, the greater is the danger of infection, and the public welfare officer's clients are frequently those representing the worst living conditions in the community. The health officer and his nurses will watch the contact cases. It is their responsibility to see that regular and thorough examinations are given and that such families are trained in health education. These are the families that should have good housing, more adequate food than families in which there has been no tuberculosis, and no serious overwork or overstrain. Here the public welfare officer has a traditional opportunity. No one can assure good housing to any needy family today, tuberculous or nontuberculous, but the goal of decent housing should never be lost sight of, and it should be attained for the families of the tuberculous whenever possible. Adequate food can be supplied, and with sufficient economic security the members of the family should be saved from serious overwork. Ruth Taylor, *Nat. Tuberc. A. Bull.*, Oct., 1949.

AN APPRAISAL OF MAJOR SURGERY IN A SMALL HOSPITAL

DAVID P. ANDERSON, M.D., F.A.C.S.
Austin, Minnesota

A REVIEW of 1000 consecutive major surgical operations, performed by the author and his colleagues of the Austin Clinic in the St. Olaf Hospital, Austin, Minnesota, has been undertaken as a background for the appraisal of general surgery in a small, non-metropolitan hospital. It is felt that such an appraisal is timely for several reasons:

1. It should be of interest to other physicians who practice surgery, either part time or as a specialty, in small communities.

2. It offers factual evidence to challenge the public claims of politicians who would have us believe that medical practice in predominantly rural areas, such as ours, is universally substandard.

3. It may be useful in re-evaluating training programs for general surgeons, to ascertain whether or not such surgeons are being adequately trained to cope with all the problems of general surgery, including traumatic surgery and the surgical subspecialties, as they are necessarily encountered in hospitals in non-metropolitan areas.

A complete classification of the 1000 operations in this survey is given in Table I. The selection of operations for classification as "major" procedures has been entirely arbitrary. Multiple-stage operations have been listed only once, and combined operations have been listed only under the title of the primary procedure.

There were twenty-one hospital deaths in this series. This operative mortality of 2.1 per cent compares favorably with reports from other general hospitals[4] and is an improvement over the mortality rate of 3.9 per cent in 785 cases reported by the author in 1942.[1] A detailed analysis of the deaths in this series is given in Table II. There were no deaths attributable directly to the anesthetic. In two patients, technical operative factors were directly or indirectly responsible for the deaths: in one case there was partial obstruction, although no leakage, at the site of an end-to-end anastomosis of the ileum; and in another case a fairly large common-duct stone was inadvertently overlooked in performing a choledochostomy on a critically ill patient. Surgical shock was listed as the primary cause of death in three patients. In each instance the age of the patient, the nature of his illness, or his cardiovascular status prior to operation influenced the unfavorable postoperative course, and in no case was the use of whole blood transfusions or other supportive therapy neglected. Pulmonary embolism, proven or strongly suspected in four patients who died, and present as a serious nonfatal postoperative complication in three other patients, has been one of our greatest

TABLE I. ONE THOUSAND CONSECUTIVE MAJOR SURGICAL OPERATIONS IN A SMALL NON-METROPOLITAN HOSPITAL

Operation	Number of Operations
Head-Neck-Faciomaxillary Surgery	
Craniotomy (Subdural hematoma, extradural hematoma and depressed skull fractures)	4
Thyroidectomy	14
Breast and Chest Surgery	
Mastectomy, radical	17
Thoracotomy (Lung abscess and empyema)	5
Subdiaphragmatic abscess, I & D of	1
Lobectomy, pulmonary	1
Gastrointestinal and General Abdominal Surgery	
Gastric resection	15
Pyloroplasty	11

worries. Early ambulation—and that means the day of or the day following operation—has not greatly influenced the incidence of this complication for us. Recently we have instituted the routine use of dicumarol therapy postoperatively in all major surgical cases except those where the nature of the procedure is contraindicative.

TABLE II. OPERATIVE DEATHS IN 1000 CONSECUTIVE MAJOR OPERATIONS

Patient Age	Operative Diagnosis	Operation	Primary Cause of Death	Interval
A.F. 68	Fracture neck of femur	Internal fixation	Pulmonary embolus	15 days
A.M. 86	Fracture neck of femur	Internal fixation	Coronary occlusion	22 days
C.B. 66	Fracture neck of femur	Internal fixation	Bronchopneumonia and Parkinson's Disease	8 days
B.C. 65	Fracture neck of femur	Internal fixation	Arteriosclerotic Parkinsonism	2 months
L.U. 89	Intertrochanteric fracture of femur	Open reduction	Shock	6 hours
L.R. 79	Intertrochanteric fracture of femur	Open reduction	Cerebral thrombosis	5 days

J.W. 60	Cholelithiasis-common duct calculus	Cholecystectomy -choledochostomy	Suppurative cholangitis secondary to residual common duct calculus	6 weeks
G.N. 83	Acute cholecystitis with perforation-common duct calculus	Cholecystectomy -choledochostomy	Bronchopneumonia	27 days
A.M. 49	Chronic portal cirrhosis	Exploration	Esophageal hemorrhage	6 days
L.F. 67	Ulcerated duodenal diverticulum with massive hemorrhage	Diverticulectomy	Shock-? acute cardiac failure	1 hour
J.M. 62	Strangulated hernia-gangrene and perforation of bowel	Small bowel resection	Peritonitis	2 days
E.W. 60	Acute intestinal obstruction -gangrene of ileum	Small bowel resection	*Mesenteric thrombosis -partial obstruction at anastamosis	14 days
J.G. 78	Incarcerated hernia	Herniorrhaphy	Bronchopneumonia and Parkinson's Disease	10 days
P.G. 75	Carcinoma of sigmoid -complete obstruction	Cecostomy	*Carcinomatosis	6 days
L.A. 73	Arteriosclerotic gangrene bilateral, ? embolic	Second low-thigh amputation	?Pulmonary embolus auricular fibrillation	in OR

*Indicates autopsy.

Surgery in the Aged

A special survey has been made of the seventy-eight major operations performed on the patients seventy years of age and over in this series. This survey is presented in Table III. There were eight hospital deaths in this group, or a mortality rate of 10.3 per cent. As is to be expected, cardiovascular complications were the primary cause of death in the majority of the eight elderly patients who did not survive operation.

Major operations must frequently be undertaken in aged patients in spite of the increased risks in the older age group. We believe that such patients should be treated in their home communities, whenever possible, as elderly individuals do not adjust well to environmental changes and often do not tolerate or cannot be persuaded to accept transfer to distant medical centers.

No specific sociological survey has been made of this group, although such a study might prove interesting, but it is known that many of these elderly patients have been restored to comfortable and useful activity. Very few are dependent, socially useless wards of the state. One man, now seventy-nine years of age, who has had two bowel resections for intestinal obstruction during the past ten years, is active in business and apparently more prosperous than ever before in his career. A woman, now approaching ninety years of age, who fortunately is financially independent, is also physically independent, active, and free of pain one year after an internal fixation of a fracture of the neck of the femur. When last examined one year after a subtotal gastrectomy for an early carcinoma of the pylorus, a woman of eighty-six years was doing her own housework and complaining only of minimal lumbar arthritic pains which were aggravated by working in her garden! Several survivors in this group are farmers who still actively participate in the management of their farms. Even a few such recoveries—and the cases cited above are not isolated examples—justify a conscientious effort on the part of the surgeon to prolong life and make it more pleasant for those patients who have outlived their allotted three-score years and ten.

TABLE III. SURGERY IN THE AGED

Operative Procedure	Number of Cases and Deaths by Age Groups			Total
	Ages 70-80	Ages 80-90	Over 90	
Appendectomy, perforated appendix	2	1	0	3
Amputation, low thigh	2(1)	0	0	2(1)
Cecostomy	1(1)	0	0	1(1)
Cholecystectomy	4	0	0	4

Vaginal hysterectomy and plastic	9	0	0	9
Totals	60(5)	16(3)	2	78(8)

Note: Hospital deaths are denoted by ( ).
Mortality rate—10.3%.

Pediatric Surgery

An analysis of the major surgery among the infants and children under twelve years of age in this series is presented in Table IV. There were no operative deaths in this group of 134 patients. It is interesting to note that fifty-one of these children were from strictly rural areas. The excellent preoperative diagnosis and care of these children by the referring general practitioner is largely responsible for the favorable operative record in this group.

TABLE IV. SURGERY IN INFANTS AND CHILDREN

Appendectomy, simple	59
Appendectomy and Meckel's diverticulectomy	2
Appendectomy and excision of urachus	1
Appendectomy, perforative appendicitis	10
Duodenojejunostomy (congenital atresia)	1
Decompression, acute subdural hematoma	1
Fracture, skull, depressed, elevation of	2
Fracture, long bones, open reduction of	4
Herniorrhaphy, elective	32
Herniorrhaphy, incarcerated or strangulated	5
Intussusception and Meckel's diverticulectomy	1
Liver, suture of traumatic laceration	3
Pyloroplasty, congenital pyloric stenosis	11
Splenectomy	1
Uretero-pelvic stricture, plastic repair of	1
Total	134

Ladd and Gross[2] have demonstrated that particular care is required in the surgical management of the infant and small child. The general surgeon who must operate upon these tiny patients should make every effort to prepare himself specifically for the task. A certain temperamental, as well as a technical, readjustment must be made in the change from adult to pediatric surgery, and more careful attention must be given to altered physiology.

Surgery in Appendicitis

A consideration of some of the various operations and specific surgical diseases covered by this survey is of interest. The most common disease requiring surgical treatment is appendicitis. In this series, there were 281 operations for appendicitis, exclusive of incidental appendectomies performed during the course of other operations. There have now been 503 consecutive operations for appendicitis, including all stages of this disease, performed during the time that the author has been the surgeon for the Austin Clinic. There have been no deaths in this series of 503 operations.

A discussion of the surgical management of appendicitis is not within the scope of this paper, but a few brief comments may be in order.

1. We do not practice the policy of "when in doubt, operate." There is no question of the fact that acute appendicitis should be treated by early operation, but this does not license the surgeon to operate indiscriminately on all patients with right lower abdominal pain. The majority of cases of acute appendicitis can be accurately diag-

nosed preoperatively. In doubtful cases, re-examination after the administration of a small dose of morphine may aid in the diagnosis. In other cases, we have not hesitated to observe the patient under hospital management and supportive therapy for periods up to twenty-four hours. We must frankly admit that operation has thus been delayed in a few cases of acute appendicitis, although without any apparent ill-effects, and that an occasional patient with a mild acute appendicitis has recovered without the benefits of operation. However, this policy has saved us the embarrassment on many occasions of performing an unnecessary or even a harmful operation.

2. In the presence of local or general peritonitis of appendiceal origin, it has been our policy to perform an appendectomy and drain the peritoneal cavity with a soft Penrose drain. An exception is made in those cases where a large, localized appendiceal abscess is present when the patient is first examined. Under such circumstances, the abscess is drained—preferably through the rectum if it points in the pelvis—and the patient is advised to have an elective appendectomy in three to four weeks. We do *not* subscribe to the so-called expectant treatment of perforative appendicitis, although a few hours delay for the preoperative preparation of a toxic or dehydrated patient is usually advantageous.

Surgery of the Gall Bladder and Biliary Tract

Disease of the gall bladder and biliary tract is of special interest to surgeons. In this series there were 131 operations on the gall bladder and bile ducts. The three deaths in these 131 operations give an operative mortality of 2.3 per cent for surgery of the biliary tract. We consider this mortality rate too high, and can justify it only by a critical review of the three deaths, as reported in Table II, and by the fact that the statistical results in our biliary surgery prior to this series have been much more favorable.

It will be noted that we have explored the common duct in 28 per cent of the operations on the biliary tract. Definitely positive findings, chiefly the presence of calculi, are encountered in about half of the cases in which the common duct is explored. The frequency with which we explore the common duct is fully justified by the fact that many common-duct calculi are thereby detected which could have been easily overlooked. We have so often discovered "silent" common-duct stones—as many as forty-four within the duct in one case—that we now fully appreciate the stand that Lahey[3] has taken for years in urging that the common and hepatic ducts be explored in up to 50 per cent of all gall-bladder operations. The procedure itself, in the hands of an experienced surgeon, does not increase the mortality and morbidity of biliary tract surgery, and adds only a few days to the patient's total recovery period.

The Surgical Treatment of Hernia

Hernia is another affliction which is of never-ending surgical interest. It is a common ailment, which in this series was encountered in 178 of 1000 major operations. The fact that the recurrence rate after hernia operations remains high, even in the hands of otherwise competent surgeons, is a particular challenge to the general surgeon in a small community to continually improve his results. Large clinics can readily absorb the embarrassment of an occasional recurrence after herniorrhaphy, but the individual surgeon in a small community must have a hernia recurrence rate which approaches nil, an accomplishment which is more than theoretically possible.

We have found one procedure helpful in evaluating the technical efficiency of our hernia repairs, a procedure which we have never seen described in the surgical literature: Under local anesthesia, which is our anesthetic of choice in primary hernia repairs, the patient is instructed to give a forceful cough during various stages of the operation. The strength of the repair can thus be demonstrated, and if stainless steel wire sutures are employed, one can be reasonably certain that the repair will remain firm until tissue healing is complete. With this assurance of a firm repair of the hernia, we have no misgivings in urging early ambulation in our cases. The patient is allowed to walk to the bathroom at any time after the operation, thus making postoperative catheterization a rare necessity. The average patient is discharged from the hospital on the third to fifth postoperative day. Sedentary occupations may be resumed in ten days, light work in two to three weeks, and unlimited activity is permitted after four weeks. We have had no known recurrences in the herniorrhaphies reported in this series.

Gastrointestinal Surgery

There are two aspects of gastrointestinal surgery that we would like to mention briefly, although with some hesitation.

1. We have adopted, during the past two years, a modification of the non-operative treatment of acute perforated peptic ulcer originally described by British surgeons. Our experience has been limited to ten cases thus far, so that we cannot speak authoritatively nor can we urge others to follow our example. However, we have been so favorably impressed by the clinical course of these patients that we are inclined to believe that this method of treatment may prove superior to the operative treatment, at least in selected cases. We have had no deaths in our cases, and in each incidence the recovery has been much smoother than we would have anticipated with the operative method of treatment. One word of caution should be injected: this non-operative treatment is strictly a surgical problem, and it demands the careful personal supervision of the surgeon.

2. In re-establishing continuity between segments of the intestinal tract, including the colon, we have used a so-called "open" type of anastomosis in all cases with good results. This fact is mentioned because numerous reports from various surgeons with wide experience advocate so many different types of "closed" anastomoses and multiple-stage operations that the general surgeon with a limited volume of gastrointestinal surgery is left in a quandary trying to decide which technique to adopt. Again we cannot speak with authority, because of our limited experience in comparison with statistical reports from large clinics, but we agree with those surgeons who contend that sepsis and peritonitis usually result from a technically poor suture line and not from the minimal contamination that theoretically occurs with an open anastomosis. We believe that the average surgeon can perform a more secure anastomosis, free from the danger of leakage, by an "open" technique.

Gynecologic Surgery

Gynecological operations accounted for approximately one in five of all major operations in this surgery. This high incidence of gynecologic surgical problems makes it essential that the general surgeon who practices in a small community, where specialists in gynecologic surgery are not always available, be well trained in this subspecialty. Training programs that omit such training for the general surgeon are to be condemned. It also seems to us that the man who is trained as a specialist in gynecologic surgery should have an adequate background of general surgery, as the arbitrary division of the abdomen of the female at the brim of the pelvis is not always respected by intra-abdominal disease processes.

There were no deaths in the 199 gynecological operations in this series, and we now have a total of 104 consecutive hysterectomies without a death.

Traumatic Surgery

The management of injuries is another aspect of general surgery that demands our consideration. In non-metropolitan areas, the general practitioner and the general surgeon are responsible for the treatment of injuries of all types. Automobile, farm and industrial accidents account for our more serious injuries. These often tax the skill of the surgeon to the utmost, and quite often he finds himself becoming involved, of necessity, in surgical problems that require a fundamental knowledge of the various surgical subspecialties. The treatment of compound fractures, primary tendon and nerve suture, and the care of internal visceral injuries are commonplace in a general surgical practice in a small community. A great variety of fractures of the long bones and crushing fractures of the vertebrae are encountered. Intracranial injuries are frequent problems, and an occasional depressed skull fracture or a localized intracranial hemorrhage will require the general surgeon to perform an emergency cranial operation. Since neurosurgeons, orthopedists and other such specialists are not universally available, general surgeons must be trained who are capable of administering skilled early definitive treatment to injuries of all types.

Conclusion

A survey of 1000 consecutive major surgical operations in a small non-metropolitan hospital has been presented, and an appraisal made of the various aspects of general surgery in a small community. Emphasis has been placed upon the necessity of maintaining training programs that will adequately prepare surgeons for the broader scope of general surgery as it is encountered in areas away from metropolitan medical centers.

MATERNAL AND INFANT MORTALITY STUDY IN A SMALL GENERAL HOSPITAL

ROBERT R. WRIGHT, M.S., M.D.
Austin, Minnesota

MEDICAL LITERATURE contains many reports of maternal and infant mortality studies. A large majority of the published studies come from large hospitals and clinics in metropolitan areas. There is a dearth of published material from the small general hospitals in the rural areas of our country.

Concurrent with the trend toward socialization of medical practice, maternal and infant care comes into sharp focus. Published figures of maternal and infant mortality are no longer the sole property of medical literature, for they now appear in our morning paper, in reports to the President, and in the proceedings of our legislative bodies.

A personal interest in determining the quality of obstetrical, infant, and premature infant care provided by private practicing physicians in a small general hospital provided the stimulus for this study. A comparison with published results from other hospitals in representative sections of our country is included.

This study is based on the hospital records of 2,519 consecutive deliveries in the St. Olaf Hospital, Austin, Minnesota, during the years 1946, 1947, and 1948. This general hospital serves the city of Austin, with a population of about 30,000, and a large surrounding rural area, making a total population of about 50,000. The population is almost entirely white. The hospital has a bed capacity of 105 with twenty-five bassinets. The average adult occupancy for the three-year period of this study was 76 per cent.

The hospital is staffed by thirty-three physicians, twenty-one of whom practice obstetrics. During the years studied, all of the work was done by general practitioners. There are no interns or residents in the hospital, and prior to January 1, 1949, there was no obstetrical specialist on the staff.

Hospital	Total No. Live Births	No. Stillbirths	Rate/1000 Live Births
St. Olaf Hospital 1946-1948	2490	40	16.06
Philadelphia Lying-In	1009	25	24.8
Gaston Hospital, Memphis	355	20	56.3

In this group of 2,519 deliveries there was one maternal death, a mortality rate of 0.039 per cent (Table I). This maternal mortality figure compares most favorably with other published figures. Newberger,[5] in an analysis of maternal mortality in the state of Illinois during 1943, found a mortality rate of 0.27 per cent. The Department of Labor,[7] in a survey of the United States for the year 1940, found a maternal mortality of 0.376 per cent. Connor,[1] in a comparable study, reports a mortality of 0.20 per cent among mothers delivered in two small general hospitals in the state of Washington.

The cause of death in the one fatality in the St. Olaf Hospital study was acute yellow atrophy of the liver. It is an interesting and significant commentary that there were no deaths nor serious complications due to puerperal sepsis or toxemia in the three years studied. This, considered with the very low maternal mortality figure, speaks favorably for the obstetrical care afforded the patient by the general practitioner in the small general hospital in this rural area.

The infant mortality rate in this study was found to be favorable in comparison with other reports. There was a total of forty stillborn infants in the three-year study, with a stillborn infant mortality rate of 16.06 per 1000 live births (Table II). Hingson et al[3] report a stillborn infant mortality rate of 24.8 per 1000 live births. Connor reports a stillborn mortality rate of 1.12 per cent, but uses his figures in relation to total babies born, instead of in relation to live births, as is the customary procedure in statistical analyses. Using similar computation, the present study reveals a stillborn mortality rate of 1.56 per cent of total babies born. In a study of caudal anesthesia

				Fatality Rate				
Period	No. of Live Births	No. Weighing 2500 gm. or Less	Incidence of Premature Births	Less than 1000 gm. 2-3	1000-1500 gm. 3-5	1501-2000 gm. 4-6	2001-2500 gm. 5-8	Total 2500 gm. or-Less 5-8
St. Olaf Hospital 1946-1948	2490	148	5.94	70.6	64.7	25.7	8.8	16.0
Long Island College Hospital—1940-1945	9084	637	7.0	92.0	41.4	17.3	4.6	16.3

in obstetrics, Hingson reports a remarkable stillborn mortality rate of 9.1 per 1000 live births in one series. However, a control group using general anesthesia at the same hospital had a stillborn mortality rate of 24.8 per 1000 live births. In the St. Olaf Hospital study, general anesthesia was universally used during the second stage of labor. Caudal anesthesia was not used in any of the deliveries during the three-year period of this study.

There was a total of fifty-four neonatal deaths in the St. Olaf Hospital Study, giving a neonatal infant mortality of 21.7 per 1000 live births (Table III). Hingson reports a neonatal infant mortality of 20.8 per 1000 live births. The Minnesota Department of Health reports a neonatal infant mortality in 1947 of 28.6 per 1000 live births. The United States Department of Health in the same year reports a neonatal infant mortality of 34.0 per 1000 live births for the entire United States. An analysis of the cause of death in the neonatal group in this study is given in Table IV.

Of the neonatal deaths, forty (74.0 per cent) occurred in premature infants. By definition, a premature infant is any infant born alive who weighs 2,500 grams (5 pounds 8 ounces) or less, whose heart beats or who moves. This definition is accepted by the American Academy of Pediatrics.[6] In this study, the premature mortality rate for the three-day period was 16.0 per 1000 live births (Table V). Koch et al[4] report a premature mortality rate of 16.3 per 1000 live births in a study of 9,084 live births at the Long Island College Hospital from 1940 to 1945. Their premature mortality rate of 16.3 per 1000 live births was achieved following a concerted attempt to improve the premature care in the Long Island College Hospital. A previous study in the Long Island College Hospital, covering the period 1924-1940, had revealed a premature mortality rate of 28.4 per 1000 live births. A tabulation of the premature fatality rates in the four standard weight division groups will be found in Table V. The four standard weight division groups include those infants weighing less than 1,000 gm., 1,001 to 1,500 gm., 1,501 to 2,000 gm. and 2,001 to 2,500 gm. A comparison of the results of the study reported herein with the results of the Long Island College Hospital is presented in Table V. It should be noted that the fatality rate in premature infants weighing less than 1,500 gm. (3 pounds 5 ounces) is high. The efforts of the obstetrical practitioner to carry the mother through to the period when an infant's weight would be above 1,500 gm., and preferably above 2,000 gm., would be compensated by a more favorable premature mortality rating.

Of the 2,519 deliveries, sixteen were by cesarean section, an incidence of only 0.63 per cent. There were two infant deaths in the sixteen infants delivered by cesarean section, resulting in an infant mortality of 12.5 per cent. Ehrenberg,[2] in an extensive study of cesarean sections performed in the hospitals of Minneapolis, Minnesota, reports an incidence of 2.6 per cent, with an infant mortality of 3.9 per cent. Connor reports an incidence of 2.96 per cent in cesarean sections done in Wenatchee, Washington, with an infant mortality of 2.0 per cent. The high infant mortality in cesarean sections in this study is of little statistical significance because of the small number of sections performed. Of the two infant fatalities, one was due to abruptio placentae, and the other was due to atelectasis and prematurity in a case of marginal placenta praevia.

TABLE VI. CESAREAN SECTIONS

	St. Olaf Hospital 1946-1948	Minneapolis (Ehrenberg) 1946	Washington (Connor) 1944-1946
Total deliveries	2519	15,556	2500
No. cesarean sections	16	405	74
Incidence per cent	0.63	2.6	2.96
Maternal mortality	0.00%	0.49%	0.00%
Infant mortality	12.5%	3.9 %	2.0 %

All cesarean sections were of the classical type. All were performed by general surgeons and general practitioners who do obstetrical surgery. The low incidence of cesarean sections and the apparent reticence of the staff to perform the lower cervical section is to be noted in this study. The absence of any maternal mortality and the low morbidity experienced make a favorable commentary.

Summary

1. A survey of the maternal and infant mortality in 2,519 consecutive deliveries by general practitioners in a small general hospital is presented.

2. The statistics as revealed in this study are compared with published statistical material from representative sections of the United States.

3. It is apparent in this study that the incidence of cesarean section is low. It is suggested that the cesarean section should occupy a greater role in the obstetrical care of the patient in this locality.

4. The general practitioner in the small general hospital can secure excellent maternal and infant mortality results in obstetrics.

SIGHT CAN BE SAVED

"From 50 to 75 per cent of all blindness is preventable," declares Dr. Franklin M. Foote of New York City, director of the National Society for the Prevention of Blindness. Dr. Foote was the guest speaker at the Minnesota Society for the Prevention of Blindness at their annual meeting held in Minneapolis, November 28.

"In the United States there are 260,000 blind. One out of every seven has become blind as the result of an eye injury, the majority of which could have been prevented. The other six attribute their blindness to eye diseases, many of which could have been corrected if taken in time," said Dr. Foote.

A field in which much educational work has been done and where there is great need for work to continue is in informing the public about glaucoma. Dr. Foote pointed out that there are 800,000 cases of glaucoma in the United States which have not yet come to the attention of eye specialists. "The big challenge which glaucoma presents is the problem of early diagnosis. During the late stages the patient's central vision fails, and when this takes place the condition is so advanced that there is little hope of retaining useful sight. Vision which is lost in chronic simple glaucoma is lost forever. But when treatment is given in the early stages it is possible to retain what vision has not been lost."

According to Dr. Foote, a study of national and state figures reveals that we are now spending $56,000,000 a year to help the blind, but less than half a million for preventing blindness. "The average pension that a blind person in Minnesota receives," commented Dr. Foote, "is less than $58 per month, a small amount for a person who is sightless. We should indeed increase the amount we are spending for the blind, but more important still, we should increase many times what we are spending for the prevention of blindness."—*Minnesota's Health,* December, 1949.

THE RATIONALE OF BLOOD TRANSFUSIONS IN THE TREATMENT OF THE TRUE TOXEMIAS OF PREGNANCY

R. T. La VAKE, M.D.
Minneapolis, Minnesota

IN TWO FORMER reports to the Minnesota Academy of Medicine,[1,2] clinical, laboratory, autopsy, and experimental data were presented which converge, in proof, upon the hypothesis that the true toxemias of pregnancy are diseases caused by cell substances from the products of conception; cell substances that are not possessed by the cells of the mother and are toxic to her cells.

The cell substances involved are the organic compounds implicated in blood incompatibility; namely, the A, B, and Rh substances, and, likely, other cell substances that must be assumed to exist, at times, because of irregular agglutination reactions in crossmatching.[3]

In nature, the cure of these diseases is forwarded by the active generation of specific antitoxic substances by the cells of the mother, and by the expulsion of the fetus and its antenatal appendages.[5]

To complete the circle of the toxin-antitoxin mechanism between fetus and mother, if the antitoxin strength in the maternal serum becomes relatively too great, the cells of the fetus containing the specific toxic substance or substances may be injured or killed, with resulting temporary or permanent injury to the fetus or death. Such injury manifests itself in neonatal jaundice, erythroblastosis fetalis, congenital hemolytic anemia, and, likely, in many degenerative diseases, such as progressive muscular dystrophy, mental abnormality, and cardiovascular-renal inadequacy, due to the weakening and destruction of fetal cells under maternal antitoxin attack. Furthermore, there is clinical and serologic obstetrical evidence that suggests forcibly that as fetal toxic cell substances may injure the cells of the mother, likewise, at times, maternal cell substances may injure fetal cells, even to the extent of causing fetal death.[5]

It has been shown that the true toxemias of pregnancy follow a mechanism of cause and cure similar to that demonstrated by diseases due to cell substances from certain bacteria and cell substances in snake venom. In the true toxemias of pregnancy, intraspecies cell substances, that cause disease because of the parasitic relationship between the products of conception and the mother, are involved. The snake injects toxic cell substances contained in its venom by a special mechanism; the fetus may deliver its relatively toxic cell substance or substances through breaks in the placental barrier. In the latter instance, therapy is complicated by the fact that we must aim so to handle the situation that, without permanent or lethal consequences to the mother, the attachment of the fetus is preserved, at least until the parasitic fetus has reached an age permitting independent viability.

As in other diseases caused by toxic cell substances, the extent and severity of the manifestations of disease tend to vary directly with the virulence and dosage of the toxic cell substance or substances, and indirectly with the strength of the specific antitoxic substances in the mother.

The strength of the specific antitoxic substance is most easily determined by titering its so-called isoagglutinin. However, the antitoxic substance has two other arms that are equally specific and tend to parallel in strength the isoagglutinin; namely, the lytic arm and the hemotropic or opsonic arm. Though, in the past, the physiological function and the biological significance of the isohemolysins, isoagglutinins, and isohemotropins in human blood have been deemed to be unexplainable, obstetrical research in the true toxemias of pregnancy seem to make it clear that their physiological function in nature is to protect the mother against a fetus containing cell substances toxic to her cells, and biologically they have played a part in evolution and the breeding in or out of cell substances.

Our traditional concepts of the serologic components of human blood, our definitions of these components and our explanations of how these components interact, have been based largely upon demonstrable phenomena consequent upon the unnatural mixture of bloods and gross blood transfusion. In nature, the chance of the mixture of bloods obtains only in the parasitic relationship between fetus and mother, and here the

---

Read before the Minnesota Academy of Medicine, October 12, 1949.

spill from the fetus is usually in such minute amounts that the cells of the mother, if injured by a toxic substance, have time to generate a specific antitoxic substance that aids in the elimination of the toxic substance and the cells containing the toxic substance, usually before the lethal mechanical effects of gross agglutination have a chance to operate. The natural mechanism is most clearly demonstrated by the Rh negative woman who, after one or many pregnancies, may develop an Rh antitoxin. Prior or coincident with the development of this antitoxin, as would be expected, she will show signs of toxemia until the strength of her antitoxin is sufficient to protect her completely. All lines of evidence considered, it is logical to conjecture that it has been this fetus-mother relationship, since the origins of the human species evoluted to the placental type, that has brought about the present inherited composition of human bloods as regards isohemolysins, isoagglutinins, and isohemotropins in our infinitessimal segment of evolutionary time. Obstetrical serologic studies would seem to indicate clearly that incompatibility between human bloods stems from the fact that the incompatible blood contains a cell substance or substances, in its cells and serum, toxic to the cells of the individual, to whose blood it is incompatible. Its incompatibility is due to the fact that the blood with which it is mixed contains either inherited or actively acquired antitoxic substances specific to the toxic substances involved.

Thus, incompatible blood is basically toxic to the cells of the recipient due to its cell substance content, and, as we see in the Rh negative woman, Rh positive blood becomes incompatible only after the Rh negative woman develops an anti-Rh antitoxin. She develops this antitoxic substance because the Rh substance is toxic and injurious to her cells. This concept of the actual toxicity of cell substances to cells of individuals whose cells do not contain the involved cell substances in their inherited molecular cell structure is essential to the understanding of the cause of the true toxemias of pregnancy. Likewise, using the Rh negative woman as an example, it is essential to understand that the appearance of the so-called specific anti-Rh isoagglutinin is an antibody reaction in the true sense of response to injury and is a manifestation of the active generation of a specific antitoxic substance which contains lytic and opsonic properties. If this same Rh negative woman, who has developed the anti-Rh isoagglutinin, is killed by a gross transfusion of Rh positive blood, the transfused red cells containing the toxic substance will be found to be not only agglutinated, but hemolyzed by the lytic arm of the antitoxin, and phagocytosed under the effects of the hemotropic or opsonic arm of the antitoxin. It is a clear toxin-antitoxin reaction phenomenon.

There is a reasonable doubt as to the existence of the traditional entities, agglutinogens and isoagglutinins. But, if in respect for tradition and for the purpose of easy popular understanding, the terms agglutinogen and isoagglutinin are used, it would seem that it should be understood that the specific cell substance and the specific agglutinogen are one and the same entity, and that the specific isoagglutinin is only a manifestation or part of the specific antitoxic substance. Agglutination is most reasonably explainable as a phenomenon brought about when a specific antitoxic substance injures the red cells containing the involved toxic cell substance. This injury allows the cells to approach closer to one another in solution and results in their sticking together, where formerly, in health, they glided by one another freely.

From the frequency of certain findings in the late pregnancy toxemias and the common progressive sequence of their appearance, the cell substances capable of causing this disease may be classified roughly as hemotoxins. They attack the hematopoietic system of the host, causing at times various types and degrees of toxic anemias, anemias that tend to be refractory to iron and liver therapy, even when given parenterally. They attack the cells of the vascular tree, causing increasing permeability; first to water, with consequent hidden and visible edema, and bringing about abnormal increments of weight; then to the larger albumen molecule, with further increase of weight and brawniness of soft tissues, albumen in the urine, and eye ground splashes; then to red cells, with red cells in the urine and petechial hemorrhages in the eye grounds and sometimes in skin and internal organs. In some instances these petechial hemorrhages may assume ecchymotic proportions in the internal organs. Prior or coincident with these manifestations, the blood pressure tends to rise, likely due to direct stimulation of the vessel cells and furthered by intervascular pressure of permeated fluids, especially in encapsulated organs such as the kidney. Vascular spasm is most clearly demonstrable in the eye grounds. It would seem likely that the differences in manifestations and their progress sequence observable in many toxemias arise from differences in the chemistry of the toxic substances involved and variation in the constitutional chemistry structure of the maternal cells.

The acceptance of this hypothesis of cause logically directs serologic therapy. The aims envisaged by the use of blood transfusions are: to raise the red cell and hemoglobin content and thus increase the detoxifying power resident in oxidation; to aid in replacing albumen lost in the urine and aid in restoring the normal chemistry of the blood; to relieve the tissues of the host of a part of the weight of the toxic attack by the absorptive power of the transfused blood; and, where the A or B substances are involved, to add at least a small complement of inherited specific antitoxic substance similar to that inherited by the mother.

The thought immediately arises that the ideal blood for use would be the blood of a woman whose blood is consonant with that of the mother as regards A, B, and Rh status; a woman who has just recovered from a toxemia caused by the same cell substance and whose titer of specific antitoxic substance is demonstrably high. In 1926 McMahon[6] reported ten cases in which he used the sera of recovered women. The results were considered to be remarkably excellent. He could suggest no explanation for these results, nor could any one of us who reviewed and pondered over his findings. At that time, though some of us had been investigating the Dienst theory of fetal blood incompatibility as the cause of toxemia, we interpreted our findings in accord with traditional concepts deduced from the unnatural mixture of bloods and blood transfusion and considered that it was entirely the mechanical effects of red cell agglutination and the necessities of elimination that caused the toxemia, if there were any connection between fetal blood incompatibility and the toxemias. We never harbored the idea that the cell substances involved were the basic cause. The results reported by McMahon were attributed to chance because obstetric and serologic data, at that time, did not seem to permit of a logical explanation of benefits that might be attributed to the use of such sera alone, and even when transfusion of normal blood was used to combat recalcitrant anemia or loss of blood in toxemias, we never attributed beneficial results to any factors other than those of replacement.

Our present knowledge would seem to direct that we use transfusions in the toxemias of pregnancy for serologic purposes to combat the fetal toxic cell substances as we use transfusions in erythroblastosis fetalis and allied fetal injury to combat maternal antitoxic substances. This purpose is so new to us that no amount of clinical data has yet been accumulated that can have any statistical value.

The invitation to give another report on this subject was accepted with avidity, because when attention was directed to investigating the possible practical advantages in point of therapy that might be derived from the application of the theory, it soon became apparent that statistically convincing evidence, founded upon comparisons of large series, could be obtained only if the theory and the consequent rationale of treatment were more widely understood and accepted, at least to the extent that men would be willing to give it a trial.

This investigation is being continued, in the reasoned belief, based upon the logical implications of the theory and a reanalysis and reappraisal of the meaning of outstanding clinical observations to date, that serologic therapy will prove definitely its position as an important adjuvant in the treatment of the true toxemias by bringing about a significant reduction in morbidity and mortality.

Discussion

Dr. G. Albin Matson, Director, Minneapolis War Memorial Blood Bank: The thought occurs to me that if this theory of the incompatibility of A, B and Rh antigens in toxemia of pregnancy is correct, then one would expect to find, in those races in which those incompatibilities do not exist, a correspondingly lesser amount of toxemia of pregnancy. It so happens that among some of the Indians of this country, we do find

(Continued on Page 73)

RESULTS OF THE 1948 CANCER STATISTICAL RESEARCH SERVICE

State Department of Health

N. O. PEARCE, M.D.
Acting Director, Division of Cancer and Heart Disease Control
and
D. S. FLEMING, M.D., M.P.H.
Chief, Section of Preventable Diseases
Minneapolis, Minnesota

CANCER, the second largest cause of death in the nation and in Minnesota, became an active reporting project of the Minnesota Department of Health on January 1, 1948, when a cancer statistical study was initiated. Under a regulation of the State Board of Health, reports were requested on cancer cases discharged from all Minnesota hospitals, both general and specialized, so that data would be available for studies on the incidence and prevalence of cancer. The results obtained were to be reported periodically to the physicians of the state. For the legal protection of those participating, cancer reporting was incorporated into a Minnesota Statute in 1949, but all the 1948 material was collected under the authority of regulation.

Minnesota's cancer statistical study has been purposely limited to reporting by hospitals. Behind this choice was the idea of sampling cancer cases as the patients are discharged from hospitals, rather than attempting to collect a complete record of all cancer cases occurring in the state. To help hospitals in making reports, two trained medical record librarians have visited each hospital periodically for direct assistance to the hospital staff. This approach has been valuable in stimulating more uniform and complete record-keeping of cancer cases as well as other hospital admissions.

The 3,798 reports returned by hospitals in 1948 were used as a basis for making a series of charts revealing significant trends in cancer for Minnesota. The generalizations made from these data must be carefully qualified. For instance, only 80 per cent of the Minnesota hospitals reported during this period. Also, these data are not entirely representative, because the cancer cases which were reported did not include those patients which were treated exclusively in the doctor's office or in the out-patient department of the hospital. With these considerations in mind, the following conclusions are presented.

For men and women, cancer strikes early and late, but its prevalence increases with age. In both sexes the youngest reported cases occurred under five, and the oldest over ninety-two. The bulk of cancer cases in women occur ten years earlier than the majority of male malignancies, the female peak coming at age sixty-two, and the male at sixty-seven.

Digestive tract cancer, which includes the esophagus, stomach, liver, intestines, and rectum, leads by far in prevalence according to site, with a slight dominance of male over female. Cancer of the female genital tract and cancer of the breast are close seconds. These three regions together form more than 60 per cent of all types reported; of this 60 per cent, approximately 75 per cent represent female cases.

The picture of digestive tract cancer in males closely parallels that of females. Although the male incidence is slightly higher, both male and female peak years coincide at sixty-two.

Less than 2 per cent of breast cancer in women occurs below the age of thirty-seven. Prevalence rises precipitously to the primary peak year of fifty-two, followed by a secondary peak at age sixty-two. Male incidence of breast cancer is negligible.

More cancer occurs in the uterus than in any other single female genital organ. In making this distinction between uterine and non-uterine cancer cases, it was learned that uterine cancer tends to occur ten years later than non-uterine cancer, whose peak age is fifty-two.

Prostatic cancer occurs relatively late in the life of the Minnesota male, its range being from fifty-two to ninety-two with the peak at seventy-seven. Cancer prevalence in other male reproductive organs scatters itself over the normal age range, with occurrences distributed so uniformly as to preclude any useful generalization.

The incidence of urinary tract cancer for both sexes is relatively low up to the age of forty-two. The picture of male urinary tract cancer shows two peaks, one at sixty-two and the other at seventy-two, while the female picture shows a slow steady increase from age forty-seven to the

peak of seventy-seven, from which point it takes a sharp drop.

About two and one-half times as many males as females are afflicted with cancer of the respiratory system. Among men under thirty-seven, the prevalence of respiratory tract cancer is less than 3 per cent. For women under thirty-seven, the figure increases to 12 per cent. The peak year for males is sixty-two, while that for females is fifty-seven. The majority of respiratory tract cancer in men falls within the age range of fifty-two to seventy-two. Outside of a moderate peak at fifty-two, the pattern of female respiratory tract cancer reveals no significant characteristic.

Buccal cancer occurs most frequently in older groups of men and women. Only 3 per cent of women and 7 per cent of men have buccal cancer before the age of forty-two. Men again lead in the number of cases, reach their peak at sixty-seven and have a high incidence in later life. Women, on the other hand, reach their peak year at sixty-two and fall off gradually with advancing years.

Skin cancer predominately is a problem of the male population. The bulk of the male skin cancer occurs between the ages of fifty-seven and eighty-two. Female incidence of skin cancer remains low and fairly steady over life age span.

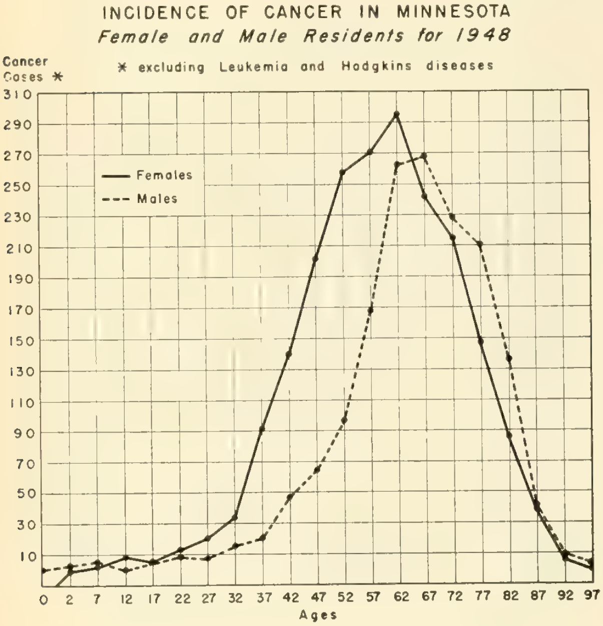

Fig. 1.

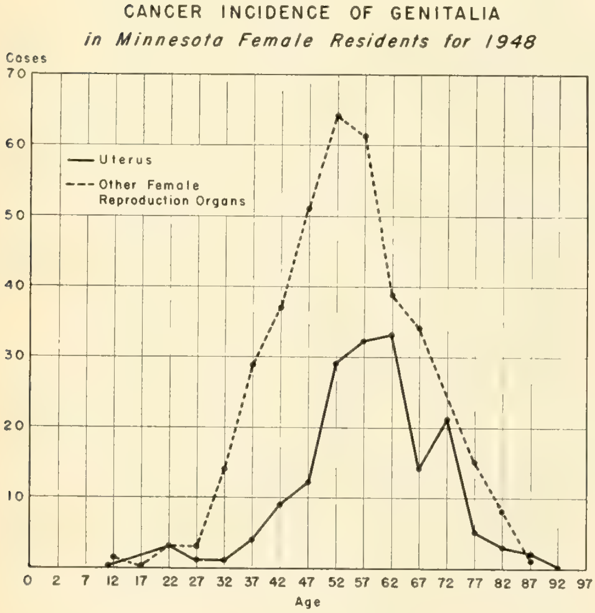

Fig. 3.

Leukemia and cancer of the central nervous system, each with six cases, account for more than half the malignancies reported under the age of ten. No significant peaks are seen in charting the ranges of these sites, and in both cases no incidence is recorded after eighty-five, about five years earlier than other recorded cancerous conditions.

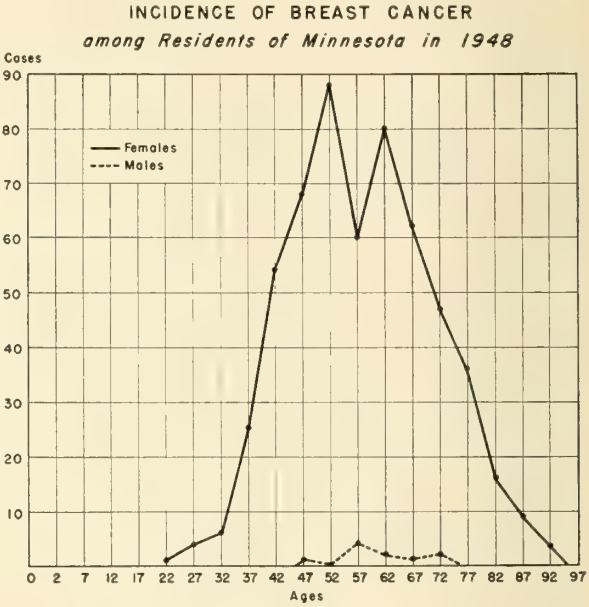

Fig. 2.

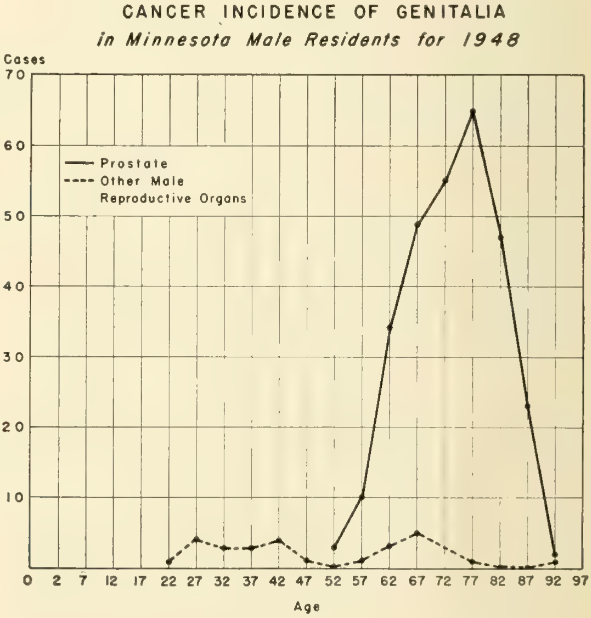

Fig. 4.

Hodgkins' disease has a low incidence, with only thirty-nine cases reported. These occur mainly in the middle years of life.

The interval between onset of symptoms and consultation with a doctor is directly related to cancer control. Although this time element in cancer is one of the most important aspects of the problem, it is one of the most difficult upon which to collect accurate and complete data. The two questions asked in the study relied upon recall and recollection by both patient and doctor; in relatively few instances were these data ever included in the original hospital record.

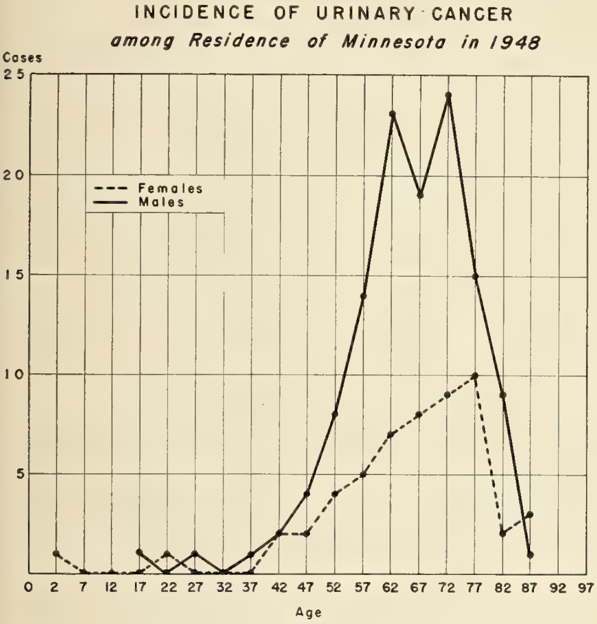

Fig. 5.

The belief that greater emphasis should be placed on acquainting people with symptoms of cancer has been borne out by the findings of this study. Six out of ten people with cancer wait four weeks or more before seeing their doctors. The doctors, however, are more prompt; five out of ten of their patients are hospitalized in less than a week, and six out of ten within a month. Although persons suffering from mouth and skin cancer would appear to have more noticeable symptoms, as a group they wait the longest before seeing their doctors. Cases of cancer of the central nervous system and leukemia, the two neoplasms which account for more than half of all cases under the age of ten, also are the two types of cancer which are most likely to lead people to seek early attention from their doctors after onset of symptoms. Women suffering from cancer of the reproductive organs are first to be hospitalized, while men with genital cancers delay the longest.

Minnesota's cancer statistical study is intended to be a continuous flexible program whose results can be significant when measured against long-term objectives. It provides a center for the collection of cancer data on Minnesota people which has never before been available. The study is an approximate measure by which our combined and coordinated efforts to combat cancer may be evaluated.

ANALYSIS OF 10,000 APPENDECTOMIES

ELMER C. PAULSON, M.D.
Minneapolis, Minnesota

IN SPITE of the fact that there is already a voluminous literature on the subject of the vermiform appendix, its study remains a fascinating one, and the diagnosis and treatment of its pathological states constitute a continuous challenge to the family physician and the surgeon. This discussion will not deal with the treatment of appendicitis or its evaluation. Numerous excellent dissertations on this phase are available in the literature, notable among which is the recent exhaustive study by Green and Watkins[6] of 19,399 cases in Cleveland. The study at hand is concerned with the pathological evaluation of the appendectomy specimen.

Source of Material

This analysis is based upon 10,000 surgically-removed vermiform appendices which were studied and classified in the laboratory of the Department of Pathology at the University of Minnesota Medical School. There are no autopsy specimens in the series. These specimens comprise the unselected material from the years 1942 to 1948, which was sent to Dr. E. T. Bell and his associates from numerous individual surgeons and small hospitals scattered over the states of Minnesota, North Dakota, South Dakota, Montana and Wisconsin. In general, the material arrived from hospitals and clinics too small to support a pathologist of their own, and who consequently chose to employ this particular laboratory to study their surgical material. Most of the hospitals and surgeons concerned were regular clients of the University laboratory, and they forwarded their formalized surgical specimens of all types every week or two. University Hospital material is examined in a separate laboratory and none of it is included herein.

Method of Study

As the specimens arrive each day, they are first examined grossly and notations made concerning length, diameter, external appearance, presence or absence of fecoliths, presence or absence of perforations or gangrenous areas, and the character of the luminal contents. Thus, it is important for the sake of an accurate examination, that the appendices be submitted *in toto* and unopened. Sections for microscopic study are taken from the most likely appearing portions of each appendix. If the specimen appears grossly normal, sections are selected at random from widely scattered portions. For a period of several years, two sections were made from each normal-appearing appendix. More recently, three sections were made from each, since it was observed that sometimes one section would show the microscopic criteria of disease and the others would be normal. Even with three sections, it is occasionally found that two will be normal and the third show disease. Consequently, there is an admitted chance of error in occasionally missing the diseased portion of an appendix. The slides are stained with haematoxylineosin. The criteria of disease may be summarized as follows:

Criteria	*Diagnosis*
1. Pus cells in tunics of appendix	Suppurative appendicitis
2. Lymphocytic infiltration of serosa	Recurrent or healing appendicitis
3. Pus in lumen of appendix but not in the tunics	Catarrhal appendicitis
4. Oxyuris vermicularis in the lumen	Pinworm infestation

Authorities have disagreed on the significance of the obliterated appendix. It is not considered pathological in this laboratory. Aschoff was sure that fibrotic obliteration was due to previous inflammation.[3] Ribbert, Zuckerkandl and others regarded it as a natural regressive process.[3] In a series of 400 autopsies, Ribbert found partial or complete occlusion of the lumen in 25 per cent. Sir Arthur Keith declared that at the age of 70, 50 per cent of individuals will have atrophied appendices.

The significance of pinworms in the appendiceal lumen is also debated by authorities. Nathan Foot[5] states that pinworms and whipworms in the appendix may produce the typical symptoms of an acute attack of appendicitis, although the mechanism involved is obscure. It is known that pinworms leave pinpoint erosions in the mucosa which may bleed slightly. M. A. Bell[2] says that pinworms do not penetrate the wall of the appendix

until after removal of the organ, when they may do so. Warwicke theorized that the presence of the parasites in the empty appendix may cause constractions simulating symptoms of appendicitis.

Chronic lymphoid appendicitis is described by Foot[5] as co-existing with chronic enlargement of mesenteric lymph nodes. This eventuates in fibrosis and obliteration.

"Chronic appendicitis," as a clinical concept, does not have much standing these days. No microscopic criteria of this syndrome are recognized in this laboratory.

Since fecoliths are so important in the etiology of appendicitis, being present in about 60 per cent of acute cases,[11] the policy has been employed of considering cases of fecolith without evidence of inflammation in the "positive" group.

Mucoceles and neoplasms are of considerable statistical interest and are classified logically into their own groups.

Incidence of Various Types in the Literature

Of particular interest in close, unified groups of physicians, is the percentage of normal appendices in a series of cases. It is generally accepted that a good diagnostician should not have more than 20 per cent normals in a sizable group of appendectomies. Sappington and Horneff[13] found 60.3 per cent normal appendices in 937 cases in 1938. They quote Aschoff as finding 35 per cent normals in a series of 847 cases of primary appendectomy. In 1941, Mason, Allen et al[9] reported 18.6 per cent normals in a group of 1,000. In 1946, Joffe and Wells[7] of Duluth reported 27.4 per cent normals in a group of 1,000.

TABLE II

Total Number Appendectomies	10,000	
Incidental Normal Appendices	1,262	
Corrected total for basis of % normals	8,738	
Positive Appendices	4,823	(55.2%)
Corrected Normal Appendices	3,915	(44.8%)

In a conglomerate group, such as I am reporting, with dozens of physicians scattered over thousands of miles contributing the material, it could hardly be expected that an ideal percentage of diagnostic accuracy would be attained. Some of these physicians are practicing medicine under difficult conditions and do not have available the diagnostic equipment or consultants of larger centers. On the other hand, certain physicians in this group have consistently excellent rates of diagnostic accuracy. Table II shows the corrected normals in this group to be 44.8 per cent.

Tuberculous appendicitis is so rare that the identification of a single case warrants its publication. In 1936, W. J. Carson[4] was able to collect 125 cases from the literature. Drissen and Zollinger, in 1935, found an incidence of 0.3 per cent among 5, 149 appendices examined at the Peter Bent Brigham Hospital over a twenty-year period.

In the group reported herein, tuberculous appendicitis constituted 0.05 per cent of the entire series of 10,000, and 0.1 per cent of the pathological appendices (Table III.)

TABLE III. PERCENTAGE INCIDENCE OF RARE TYPES

	In Entire Group	In Positive Group (4823)
1. Tuberculous Appendix	0.05%	0.10%
2. Mucocele	0.17%	0.35%
3. Adenomyoma	0.02%	0.04%
4. Carcinoid	0.11%	0.23%
5. Carcinoma	0.02%	0.04%
5a. Primary Carcinoma	0.01%	0.02%

R. A. Moore[11] states that mucocele of the appendix occurs in about 2 per cent of all persons. Uihlein and McDonald[14] found twelve mucoceles in the Mayo Clinic material from years 1910 to 1941. This is in contrast with 127 carcinoids and five adenocarcinomas. These figures would indicate that mucocele of the appendix is a comparatively rare discovery for the surgeon.

In this series there were seventeen mucoceles, or 0.17 per cent of the entire group, and 0.35 per cent of the pathological portion.

I could find no references on the incidence of adenomyoma of the appendix in the literature. One would expect its occurrence to be closely related to the incidence of endometriosis, whether symptomatic or not. In the two cases herein listed, the adenomyomas were found in the serosal layer, indicating, of course, that they were peritoneal implants. The gross incidence was 0.02 per cent; and the incidence of the pathological group 0.04 per cent.

Carcinoids constitute the most common tumor of the appendix, and there is a rather extensive literature on the subject. This very interesting lesion was named by Oberndorfer in 1907[10] on the basis of its histology and apparent benignity. Some of the standard textbooks (Boyd,[3] Bell[1]) state its incidence as from 0.3 per cent to 0.5 per cent of all appendices removed surgically. McCarty and McGrath,[8] with 0.44 per cent of a series of 8,039 from the Mayo Clinic in 1914, and Selinger,[12] with 0.35 per cent of a series of about 10,000 from New York Post Graduate Hospital in 1929, support this generalization. However, Thomas Moore,[10] in 1938, found only ten cases of carcinoid among 10,229 appendectomies, at the Royal Victoria Infirmary, Newcastle on Tyne, over a ten-year period. It is interesting, in passing, to quote Young and Wyman[15] to the effect that 82 per cent of carcinoids occur in females because that was exactly the situation in my series.

TABLE IV

Total Female Normal Appendices.......... (Corrected for incidental group)	2,649	
Negative appendix with resection of ovary for small follicular or luteal cysts or corpus luteum..........................	478	(18.%)
A. Negative appendix plus corpus luteum..	148	(5.5%)

The incidence of carcinoid in this series is in remarkable agreement with T. Moore, rather than with the earlier authors, namely 0.11 per cent of the series of 10,000, and 0.23 per cent of pathological appendices.

True carcinoma of the appendix is very rare. The literature has to be examined critically when searching for reports[15] on this lesion since many writers use the term rather loosely and include carcinoids and mucoceles in the category. Nathan Foot says that of the thousands of appendices he examined at New York Hospital over a twelve-year period, not one showed true carcinoma. Thomas Moore[10] found one case of true carcinoma in 10,229 appendectomies. This coincides with the findings of the present series in which two true carcinomas were found, one primary, and one metastatic.

Comment

It will be noted that in the group of normal appendices, after those incidental to other major abdominal operations have been excluded, the females outnumber the males two to one. In view of the proximity of the female genital tract to the appendix, and in view of the proneness of the former to yield symptoms which may be confused with appendicitis, this disproportion is probably to be expected. Reference to Tables I and IV reveals some additional information concerning the normal female appendices. In 478 (18.0%) of the 2,649 females from whom normal appendices were removed, the ovary or ovaries were resected, with the resultant pathological dis-

(Continued on Page 53)

THE TREATMENT OF ACUTE CHEST INJURIES

With Especial Reference to the Use of Tracheotomy

IVAN D. BARONOFSKY, M.D., ROY W. DICKMAN, M.D., and
EDWARD S. VANDERHOOF, M.D.
Minneapolis, Minnesota

THERE ARE few medical and surgical emergencies wherein the patient's recovery is determined by the physician's being able to recall immediately the basic physiology, anatomy and treatment of the emergency. Acute chest injury is one such example and is illustrated by the following case.

A thirty-five-year-old white man was admitted to the emergency room at Ancker Hospital following a car-train collision on April 3, 1949. He was unconscious, in shock, markedly dyspneic, and cyanotic. He had severe subcutaneous emphysema particularly of the neck and face. There were fractures of the first and second ribs on the left and of the first on the right. He also had a comminuted fracture of the distal third of the left ulna and radius and a fractured left clavicle. His pulse became very weak and rapid. Because of his respirations, pulse, and the rapid increase in emphysema in the suprasternal notch, and from physical examination, a diagnosis of severe mediastinal emphysema and left pneumothorax was made.

A 15-gauge needle was inserted adjacent to the sternum into the left fourth interspace and directed medially into the mediastinum. About 15 c.c. of air was withdrawn with immediate respiratory relief to the patient. Immediately following removal of the needle, the patient again developed symptoms and again was relieved by aspiration. A 15-gauge needle connected to a stop cock and 50 c.c. syringe then was inserted into the left third interspace anterior-laterally and 1500 c.c. of air was removed from the pleural cavity. This was done on several occasions with marked improvement in the patient's respirations and color. It was evident that the patient had a bronchopleural fistula because of the rapid accumulation of air into the pleural cavity, so a left thoracostomy was done with the introduction of a No. 15 urethral catheter through a trocar in the region where the needle was inserted. The catheter was attached to a Stedman pump and constant suction maintained. It soon became evident that the patient's bronchopulmonary tree was filling with secretion typical of the "wet lung" syndrome. Because catheter suction of the trachea through the larynx was unsatisfactory due to the patient's unconsciousness, and since numerous autopsies here have shown that many of these patients die from pulmonary complications arising from overaccumulation of bronchial secretions, a tracheotomy was performed. A profuse amount of intratracheal and intrabronchial secretions was aspirated with again marked improvement in the patient's respiration. Five hundred c.c. of blood had been started upon admission and supplemented with 1000 c.c. of 10% glucose in distilled water. Almost constant suction was maintained the next 24 hours to keep his respiratory tree cleared.

The next day, examination revealed a right pneumothorax, and a right thoracostomy with a catheter and a trocar was done after several needle aspirations of air. His temperature rose to 104.2° but gradually subsided during the next thirteen days. He alternated between coma and disorientation for thirteen days, during which time constant tracheal suction and penicillin therapy were maintained. On the fifth day, physical examination and radiographs revealed expansion of the lungs, and after clamping the thoracostomy tubes for twenty-four hours without recurrence of symptoms of pneumothorax, the tubes were removed. He had received a total of four pints of blood about 2000 c.c. of intravenous fluid per day. On the seventeenth day, the tracheotomy tube was plugged with a cork since trachea suction was no longer necessary and the tube was removed in twenty-four hours. An open reduction of the ulna and radius was performed the twenty-fifth day and on April 29, 1949, the patient was discharged from the hospital and has been well since.

Comment.—This case represents several interesting procedures which were instituted as lifesaving measures. The mediastinal aspiration and left thoracostomy are prime examples. Had a tracheotomy not been done, it is probable that pulmonary complication would have been such that the patient would have succumbed within the next two days because it would have been necessary to bronchoscope him every three to four hours to offer him respiratory relief from profuse bronchial secretions. Patients in a state of coma are unable to bring up these secretions and subsequently may die of bronchopneumonia. This fact plus the presence of severe chest injury which in itself is an important cause of "wet lungs" (edema), suggests that tracheotomy should be thought about early in cases of the type presented. His entire course was based upon a fundamental knowledge of the physiology and anatomy of the chest and training in the treatment of thoracic injuries.

Physiology

The physiology of the thoracic structures is only too poorly understood by many untrained

---

From the Department of Surgery, University of Minnesota, and Ancker Hospital.
Dr. Vanderhoof is now at Veterans Hospital, Sioux Falls, South Dakota.

in the chest specialties. The thorax is a semirigid cage, within which lie the lungs and mediastinum which respond to simple physical laws. When the muscles of respiration act during the inspiratory phase, the thoracic cage is enlarged, creating a negative pressure approximately —6 mm. Hg within the thorax. Air enters the lungs via the larynx and trachea much as it would into a bellows. The lung parenchyma is stretched as air enters the alveoli; and when the muscles of respiration cease to act, the expiratory phase, a purely passive action, takes place due to the contractility of the muscle and lung tissue. At the end of expiration the pressure within the thorax is about —2.5 mm. Hg. When a person is dyspneic, accessory muscles of respiration come into play, and the expiratory phase then becomes an active phase. Pressures in the chest may change over tenfold. It is readily understood that the above cycle is dependent upon both a firm and a sealed thoracic cage. Should a chest wall become flail through injury, the wall will respond to the intrathoracic negative pressure and transmit its negative pressure to the mediastinum if it is not fixed from disease, so that no increase of intrathoracic pressure is transmitted to the lungs and the act of inspiration does not occur. This also takes place in large sucking wounds of the thorax where the air enters and leaves the thoracic cage through the wound in response to the forces of respiration instead of through the larynx and trachea.

The mediastinum contains the heart, great vessels, nerves, lymph nodes, thymus and part of the thyroid. There is no cage protecting these structures so they are also acted upon and influenced by intrathoracic pressure. When the intrathoracic pressure becomes more negative during inspiration, the great veins and atria tend to fill with blood because the intravenous pressure in these organs is much less than in other parts of the venous circulation. Expiration, especially if forced, tends to force blood out of these organs. These veins, including those of the neck, are valveless and any sudden imbalance of pressure within the thorax may adversely affect the cardiorespiratory function of the body. Traumatic asphyxia due to a sudden crushing injury with a compression of the thorax is a typical example. The enormous increase of intrathoracic pressure collapses the great veins and atria and forces blood into the valveless veins of the head and neck causing a cyanotic discoloration of a "violet hue" and petechiae of the head, neck and shoulders. There may be subconjunctival hemorrhage with protrusion of eyes and swelling of the lids and tongue. Blindness may result. Cerebral symptoms such as coma, rigidity, and convulsions may be present and are due to the anoxia rather than to cerebral petechiae. This type is known as ecchymotic traumatic asphyxia. The pale type may also have areas of purplish discoloration but there is a typical pallor of the face and neck and the patient has a cold, clammy skin; weak, rapid, thready pulse; and an uneven, shallow respiration.

Another important physiological problem is intrabronchial secretions which may complicate an acute chest injury. Normally, the bronchial secretions are relatively fluid, becoming more so as they approach the main bronchi. The bronchial tree is kept clear by the beating of the bronchial cilia which sweep toward the trachea and larynx and also by the cough mechanism in which intrabronchial pressure is built up by sudden expiration from the force of the expiratory muscles of respiration and the bronchial musculature, resulting in marked increase of pressure of the intrabronchial air against a closed larynx. When the larynx suddently opens, the intrabronchial pressure is suddenly released carrying with it particles of intrabronchial and tracheal secretion. When these secretions become overabundant due to stimulation of the secreting cells and more mucoid and tenacious, it becomes more difficult to expel the sputum. If pain is present in the chest, the patient normally inhibits his cough reflex. There is evidence accumulating to show that following severe chest injuries, the secretions of the tracheal bronchial tree are altered and become more profuse yet more mucoid and sticky.[4,15] Burford and Burbank believe that intrathoracic organs, especially the lung, react to localized contusion of the chest wall very much as tissues in any part of the body may react to localized blows, that is, with edema formation. This, in the lung, may result in atelectasis, hypoxemia, and pneumonitis. deTakats[16] demonstrated experimentally that the bronchial tree goes into spasm following chest wall injuries, pulmonary emboli, or vagal stimulation and secretes thick, sticky mucus. This material is very difficult to raise, especially if coughing causes chest pain, and the cycle terminates in a clinical entity described as "wet lung." He proved that atropine or papaverine in high dosages partially and at times entirely blocked this mechanism. It would seem logical therefore to use these drugs to prevent the condition from arising. If the secretions have already formed, they must be aspirated by a catheter or bronchoscope since atropine will only further prevent their being diluted by normal secretion. On occasions, such as in this case report, tracheotomy must be resorted to because, if untreated, the wet lung syndrome will result in death.

With an understanding of these few fundamentals, a rational attack to the problem of an acute chest injury can be launched. The first and primary job is to correct the severe cardiorespiratory difficulty. From just a glance, a few words about the type of injury sustained, percussion and auscultation, a diagnosis of the injuries present can usually be made. If the patient presents evidence of traumatic asphyxia and dyspnea due to increased intrathoracic pressure, it is usually either severe tension pneumothorax or a hemothorax, the differentiation of which is easily made by percussion and auscultation. These procedures also give information as to whether a "wet lung" is developing. If he is breathing rapidly but is still pale and somewhat cyanotic, a quick examination reveals whether a flail chest or a crushing chest wound is present. If mediastinal emphysema is present, there will be also severe subcutaneous emphysema about the neck and face; the diagnosis is easily made by palpation. The treatment of each of these problems is well known.

Tension Pneumothorax

Tension pneumothorax may develop without rib fracture or penetration of missiles. The patient presents a picture of acute dyspnea and cyanosis and has total or partial collapse of the involved lung. He may present either the picture of the pale or ecchymotic type of traumatic anoxia. Percussion reveals marked tympany on the side of the pneumothorax and usually a shift of the mediastinum. Auscultation reveals little or no breath sounds in the involved side. Diagnosis can positively be made by x-ray, but on occasion there is no time to wait for films. An 18-gauge needle inserted into the chest wall at the level of third or fourth rib anterior-laterally will result in a loud hissing noise as the air under pressure escapes. This will relieve the patient while a syringe is readied with either a rubber adapter that can be fitted over the needle and attached to the syringe or a two-way stopcock. If the air ceases to leave the needle and is being sucked in before the syringe is ready, the adapter end of the needle must be covered tightly to prevent air being sucked into the thoracic cavity. With the syringe, air is removed until the pleura can be felt rubbing against the end of the needle or the patient complains of a severe tight sensation in the chest, a cough, or has a poor pulse.

The next day more air can be aspirated and the lung expanded. If the pleura is left with too negative a pressure as evidenced by the severe tight feeling the patient experiences, pleural effusion will develop. If air rapidly accumulates after aspiration, there is a tear into the lung parenchyma or bronchus creating a bronchopleural fistula. The air should be reaspirated; and if the accumulation continues, a soft rubber catheter should be inserted through a trocar into the thoracic cavity at about the level of the fourth or fifth rib in the anterior axillary line and connected to either a Stedman pump or water trap bottle until the lung is expanded.

Tension pneumothorax must be differentiated from progressive bullous emphysema since aspiration of these bulli usually results in death.[1]

Hemothorax

The patient usually complains of pain in the involved side of the chest and may be dyspneic and cyanotic. If the hemothorax is massive, he may also present the picture of traumatic anoxia. On other occasions, it is only diagnosed by routine chest films taken for rib detail and the localization of the fractured ribs. It is well proven that immediate aspiration of the hemothorax and instillation of at least 500,000 U. of penicillin without air replacement is now the treatment of choice[4,5,8,13] as compared to the previous custom of either leaving the blood in the thoracic cavity or replacing the blood with air. If there is continuous bleeding, neither leaving the blood in the chest nor replacing it with air will stop the bleeding and a thoracotomy will be necessary.[6] When introduced into a hemothorax, air rises only to the apex of the chest, which prevents the expansion of the upper lobe which is the most difficult part of the lung to expand if a "thickened pleura" develops.[5]

Also, the popular belief that blood lying free in the pleural cavity will not clot is fallacious. If there is a crushing type trauma of the pleura or lung, clotting readily takes place.[2] Following clotting multiple loculations develop necessitating thoracotomy with decortication of the thickened "peel" over the pleura of the lung. Actually, the "peel" is not a thickened pleura but rather an organized exudate overlying and adhering to a normal pleura.

Mediastinal Emphysema

It is rare that mediastinal emphysema becomes so severe that treatment must be instituted. However, the reported case demonstrates that this may happen. The patient may present symptoms of dysphagia, cyanosis, extrapericardial tamponade with circulatory failure and death. There may be electrocardiographic changes and a "popping" sound heard during systole. Aspiration as described by Gumbiner and Cutler should be carried out. A needle is inserted in the third or fourth left interspace 1 cm. to the left of the sternal border and directed medially parallel to the surface of the sternum, and aspiration performed. Incisions in the suprasternal notch should be avoided if possible.

Flail Chest

The patient usually has acute respiratory embarrassment and chest pain with gross evidence of the flail chest and paradoxical respiration. There are fractures of the involved ribs in two places. The chest wall must be fixed by some method, one of which is the use of towel clips around several of the involved ribs midway between the fractured sites. The clips must be held under tension by traction.[3] The chest wall may be supported in the other direction by adhesive tape. Tape alone is of no benefit. Since the patient will have pain with coughing in any type of rib fractures, the best method of treatment is injection of the intercostal nerves with novocaine proximal to the sites of fracture. Depressed fractures of the sternum also result in a flail chest. The sternum must be supported by traction instituted either with towel clips, a wire inserted under the sternum, or malar traction clamps. Care must be taken not to pierce or tear the internal mammary arteries.[10]

Sucking Wounds

The patient presents the same symptoms as in a flail chest. The sucking wound must be immediately sealed with an occlusive dressing and the pleural cavities aspirated of air and blood to restore the patient's cardiorespiratory balance. Under sterile technique the wound must be debrided, bleeding vessels ligated, and the wound closed primarily. Pneumothorax and hemothorax must be handled as previously described. Penicillin should be introduced into the pleural cavity.

Wet Lung

The interesting clinical entity, wet lung, if untreated, often leads to atelectasis, pneumonia, bronchiectasis, or death. As previously described it seems to result from chest wall trauma and pain. If intercostal nerve blocks are done and the patient is relieved of pain and can cough sufficiently to clear the respiratory passages, the passages remain clear until the pain reappears. Atropine used after clearing the passages blocks the re-formation of the mucus.[7] The technique of intercostal block is very simple. The injections are made preferably at the angles of the ribs. A 20-gauge needle is directed perpendicularly until the rib is encountered and then directed under the rib for the distance of 0.5 cm. Five to 10 c.c. of 1 or 2 per cent novocaine are injected into this area. All the involved ribs are injected including the uninvolved rib above and below. Paravertebral blocks also may be used, the technique of which is only slightly more difficult.[9] The patient should have moderate sedation for restlessness. Morphine sulfate can be used since the slow respirations are more efficient than the rapid type.[12] Carbon dioxide 100 per cent for two to three breaths followed by coughing is helpful. If no improvement occurs after injecting the intercostals and using CO_2, place the patient in a semi-Fowler's position and pass a No. 16 or No. 18 urethral catheter with suction attached through nose into pharynx. During an inspiration advance the catheter rather rapidly, and it will usually pass into the larynx.[15]

The patient will experience a severe coughing spell in spite of pain and will raise an appreciable amount of the tenacious sputum. Also, if possible, leave the catheter in place until the passageways are clear. If clearing the passageway fails by this method, then bronchoscopy must be resorted to.

It is to be emphasized that the bronchial passages are to be kept clear at all costs. Patients with chest injuries frequently die of bacterial pneumonitis after the basic disturbances in the chest physiology have been readjusted. Catheter suction is excellent if an experienced person is present constantly at the bedside, because the secretions accumulate rapidly. If there is any doubt that catheter suction or bronchoscopy will not suffice, tracheotomy should be instituted early. With a tracheotomy present, suction of the trachea and bronchi can be carried out simply, quickly, and accurately. In those cases where loss of sensorium is present in addition to severe chest injury, it is our belief that tracheotomy should be instituted immediately. In fact, tracheotomy probably should be employed in all patients with coma who have a reasonable chance of getting well.

Summary and Conclusions

1. A case is presented in which bilateral pneumothorax, mediastinal emphysema, rib fractures and coma were present on admission. Treatment of these conditions is discussed.
2. There is a short discussion of the physiology of the chest, and treatment of the more common types of acute chest injury is given.
3. It is suggested that tracheotomy in cases of severe chest injury should be considered very early in order that the bronchial secretions may be removed adequately.

ANALYSIS OF 10,000 APPENDECTOMIES

(Continued from Page 48)

closure of small follicular or luteal cysts or normal corpora lutea. These figures refer only to tiny cysts, not to large ovarian cysts of various types. Evidently, the surgeon, after his disappointment in encountering a normal appendix, went on to examine the pelvic organs. Upon finding a slightly enlarged or reddish or yellowish ovary, he resected it with the hopes that it would cure the patients' symptoms. Probably this is a naïve explanation. At any rate, the pathological study of these specimens forces the conclusion that the additional procedures were not warranted. Particularly unjustified is the removal of a normal corpus luteum (which occurred in 5.5 per cent of the negative female group.) Identification of the corpus luteum for what it is *in situ* at the time of surgery would enable the operator to diagnose probable *Mittelschmerz* and warn the patient of possible similar attacks in the future.

Summary

This study comprises 10,000 consecutive surgically-removed appendices, which were examined over a seven-year period in the laboratory of Dr. E. T. Bell and his associates at the University of Minnesota. The series is analyzed by means of several tables. The incidence of the rare types is described and compared with that found in the literature. After deducting the normal appendectomies incidental to other abdominal operations, the corrected percentage of normals is 44.8 per cent. The practice of resecting an unpathological ovary in the presence of a normal appendix is described and commented upon.

HEMOCHROMATOSIS

C. N. HARRIS, M.D. and R. E. HANSEN, M.D.
Hibbing, Minnesota

HEMOCHROMATOSIS is a comparatively rare disease, thought to be of metabolic origin and usually characterized by the triad: (1) marked deposition of iron-containing pigments in many of the body organs; (2) cirrhosis of the liver; (3) diabetes mellitus.

The disease was perhaps first described in 1871 by Trosier, who recognized a bronze cachexia in cases of diabetes mellitus. Von Recklinghausen, in 1889, named the disease hemochromatosis and thought it was due to primary blood destruction which resulted in deposits of pigment through the body.

The paucity of this disease becomes very apparent when one realizes that less than 600 cases have been reported. In a large Toronto hospital, only nine cases in thirteen years were observed.[1] Bellevue Hospital, New York, reports four cases in 5000 autopsies; Johns Hopkins, three cases in 100,000 admissions. Another study of 5000 diabetics revealed only two cases.

The disease enjoys a world-wide distribution and is seen chiefly between the ages of forty-five and fifty-five years. Men are especially affected, perhaps 90 per cent of the cases being of this sex.

The etiology of the disease is uncertain and various theories have been advanced. Some believe that the disease is due to a toxin either bacteriological or chemical (zinc-lead-copper) whereby there is destruction of red blood cells with liberation of iron from hemoglobin. The nutritional basis has been offered as an explanation because in Africa the disease is a common sequela of pellagra which in turn is a dietary deficiency state. Butt and Wilder suggest that perhaps a hypovitaminosis A during fetal life renders the intestinal mucosa defective and thereby permits the entrance of amounts of iron or affects the general body metabolism so that iron in individual cells is defectively metabolized. Some writers believe there is an association between aplastic anemia, treated by repeated transfusions and hemochromatosis, the iron from the destruction of blood being deposited in a cirrhotic liver and also in the pancreas. Perhaps the most adequate explanation of the disease in the light of our present knowledge is that the disorder is an inborn error of metabolism, probably congenital, which allows the entrance of small amounts of iron into the cell, but does not permit its excretion. The symptoms of the disease are due to the secondary resultant effects, cellular destruction and fibrosis in the various organs.

The pathology of the disease[2] is concerned primarily with pigment alteration, which secondarily produces destruction and fibrosis of the various body structures. Melanin, a normal skin pigment, is markedly increased and does not enter into the destructive process as does hemosiderin and hemofuscin. Hemosiderin is a protein-iron compound with a deep yellow to brownish-yellow color and is found in all tissue, except perhaps nerve and smooth muscle. Hemofuscin varies from a light yellow to dark brown and doesn't react to chemical tests for iron. It occurs, as contrasted to hemosiderin, in smooth muscle. The total amount of iron deposited in the body at the time of death varies from 25 grams to 50 grams in comparison with the average normal of 3 grams.

The changes in the liver are usually striking. This organ is greatly enlarged, the majority of cases presenting livers weighing over 2000 grams. However, it has been observed that in about 10 per cent, the liver is smaller than normal. Grossly, the liver has a reddish tint and is finely granular. Microscopically there are deposits of hemosiderin in the liver cells and in the fibrous tissue with evidence of degeneration, producing a cirrhosis.

The pancreas is fibrotic and presents a reddish tint similar to that of the liver. The islands of Langerhans are reduced in number and exhibit fibrosis in about 80 per cent of the cases. The spleen varies in size, but is usually increased. There are deposits of hemosiderin and hemofuscin present but not as marked as in the liver. The gastrointestinal tract is affected by the pigment, but otherwise shows no definite changes. The heart is usually deeply pigmented with hemosiderin, but definite fibrotic changes are not often observed. The thyroids and parathyroids show marked pigment involvement with added degenerative and fibrotic alterations. The adrenal cortex contains much pigment. The anterior lobe of the pituitary

---

From the Adams Clinic, Hibbing, Minnesota.

practically always contains deposits. The testes often show atrophic changes in the sperminal epithelium. In the skin there is an increase in the melanin which occurs in the deeper epidermis, whereas the corium harbors hemosiderin, mainly in the cells of the sweat glands. Hemofuscin is confined to the walls of the blood vessels.

The clinical features of the disease are primarily three in number; however, a single case may present any one, two, or three features or a combination of them. The initial symptom in each case may certainly vary. Sheldon states that pigmentation occurred first in 26 per cent of his cases.[8] Butt and Wilder noted its onset as an initial sign in 40 per cent of their series.[3] Diabetes as the first sign was noted by Sheldon in 25 per cent and other authors have found this also. Cirrhosis has been noted as the anlage in about 25 per cent of the cases. Chesner[5] reported a case with some interesting features; the disease occurred in a fourteen-year-old, which is unusual, and the patient did not have the skin pigmentation or diabetes; however, the liver and spleen were palpable. A severe hypochromocytic anemia of the iron deficiency type preceded the disease symptoms by six years. Diagnosis was made at autopsy, based on the finding of pigment cirrhosis of the liver and pancreas.

The skin pigmentation is seen in about 80 per cent of the cases and it appears in varying degrees from a diffuse bronzing to a slate-like metallic tint. The face, nipples, scars and extensor areas of the arms show the greatest color; however, the entire body may be pigmented. The intensity of the pigment may vary. Certainly as the disease progresses, the color will perhaps do likewise. With the use of insulin, the pigmentation may change in intensity. Humphrey[7] reported a case in which the pigmentation varied from light to dark. This he postulated might be due to the varying volume of water and glycogen storage in the superficial skin cells while the patient was under insulin treatment.

The diabetes once established has a tendency to become more severe and uncontrollable. Perhaps the patient becomes insulin resistant, but most likely the progressive degeneration of the pancreas is responsible. The glycemia is extremely labile, patients approaching coma on one day and victims of hypoglycemia the next. This cardinal variability might be due to the cumulative physiological action of the involved liver, adrenal, pituitary, and thyroid glands. Sheldon showed diabetes to be present in 70 per cent of his cases. Wilder observed it in 86 per cent of his cases.

The enlargement of the liver has been considered the most common entity, being present in more than 90 per cent of the cases according to Sheldon. Clinically, the liver is smooth and not tender on palpation, and occasionally one finds one lobe more involved than the other. Ascites has been observed in about 20 per cent of the cases. The spleen is enlarged, according to Sheldon, in 60 per cent of the cases.

Some of the less protean manifestations of the disease are interesting and bear mention. The influence of the disease on the sexual characteristics has been reported, and the changes in the male are noteworthy. Loss of hair, impotence, and atrophy of the testicles are characteristic. The basis of such changes might be explained by the inactivation of estrogens by the liver or by the infiltration of the anterior pituitary with hemosiderin.[4] Marked asthenia may be present and could be explained by the involvement of the adrenal glands. The neurological signs such as unsteady gait and loss of tendon reflexes are infrequently encountered.

The diagnosis is established by the integration of the symptoms and the following laboratory aids: intradermal test of Fishback,[6] skin biopsy, demonstration of hemosiderin in the urine and ascites fluid, and liver biopsy.

Case Report

J. N., aged forty-eight, was seen on February 18, 1948, about 4:30 P.M. with the following history. On February 17, he got up to go to work, but did not feel too well. He was slightly nauseated. He had very little breakfast and took his usual dose of protamin zinc insulin, 80 units, and went to his office. About 11 A.M. he came home and went right to bed. He refused food. He slept all day but was muttering in his sleep. His wife states that he would rouse to questions, but would go right back to sleep. At 4 P.M. she coaxed him to take a bowl of soup. He refused food during the night and the following morning had very little breakfast, but did not take insulin. When seen at home, he was drowsy, restless, irrational, complained of nausea and vomiting, and had a loose watery stool. His fever at home was 103.5°. He would answer questions rationally and intelligently, but if left alone for one or two minutes would doze off and begin muttering incoherently. He denied a cold. He was hospitalized at once.

Past history revealed jaundice in youth. First symptoms of any serious trouble appeared in 1934. Previous to that time, he had averaged 220 pounds in weight and had been very rugged. He played football, and was very active in sports while in school. In 1934, he lost 66 pounds in two months. At that time, he states that he was very tired and mentally confused. Diabetes and an enlarged liver were discovered at that time. He maintained a weight of 154 pounds for eight years on a diet and 40 units of insulin daily. He then became careless and again lost weight down to 145 pounds. At that time, in 1942, he came under the care of one of us (C. N. H.). When questioned about his color, he stated that he thought the change had begun to appear about 1934 and had steadily become more pronounced. The size of the liver apparently had not changed since 1934. At that time, 1942, he complained of pain in the lower one-third of the right thigh, which was present for six weeks. Previous to the onset of pain in the thigh, he had sacroiliac pain for one month. When the pain left the back, it migrated to the thigh. Diet and increase of insulin to 60 units corrected the pain and increased the feeling of well-being. Between 1942 and 1946, the blood sugar ranged from 133 to 322. In February, 1946, he developed a carbuncle on the neck. It then became necessary to increase his insulin to 80 units. In April, 1946, he developed a boil on the scalp. From then on to 1948, he took 80 units of protamin zinc insulin daily. He was next seen February 18, 1948, for his present illness.

His habits had been good since 1934, except for occasional carelessness about his diet. He had never been a heavy drinker. His father and mother were living and well. He was married and his wife and one child were living and well.

By occupation he sold oil, gas and accessories.

Examination revealed a well-nourished, adult man, forty-eight years of age. The hair was sparse on the scalp and body. The skin was a bluish color, but on the exposed surfaces of the body—face, neck, and hands—was almost bronze. There were a few spider nevi over the upper chest. The ears were normal. There was no cervical adenitis. The teeth showed no caries but there were quite a few missing as a result of extractions. The throat was moderately injected. The uvula was edematous. The heart was slightly enlarged to the left and downward. There was a faint mitral murmur, systolic in time, not transmitted, which had never been heard previously. The blood pressure was 120/65. The lungs presented no areas of consolidation; the respiratory excursions were full and free. There were a few scattered râles at both bases. There was rather more than moderate distention of the abdomen. The liver was enlarged and was palpated about 4 or 5 inches below the costal margin anteriorly, and about 2 inches laterally. The liver dullness also extended upward beyond the average margin. The edge was rounded and firm, but not tender. The spleen was palpable, but not tender. There was no tenderness or muscle-spasm present. There was no hernia. The genitalia were normal except that the testes appeared small. Chest x-ray by a portable machine revealed no consolidation.

The laboratory reports were as follows: hemoglobin 99 per cent, gms. 14.3, WBC 12,200; N. seg. 21, Seg. 65, Lymph 12, Mono 2. Blood sugar 266 mg. per cent.

Temperature on admission was 103°. The temperature ranged from 100.4 to 109 degrees on the last day of illness. Pulse on admission was 110; pulse elevation and respiration corresponded fairly well with the temperature range. Sedimentation rate 23 in a half hour and 27.3 in one hour. Spinal fluid clear, colorless; protein 44, Chlorides 698, Sugar 141. Urine 3 plus sugar, albumin trace, acid 5.5. No diacetic acid or acetone.

On February 19, râles at the base were slightly increased. They were fine and crepitant. The patient was very disoriented. There was still moderate distention of the abdomen, the legs and arms were sore. There were petechial spots on the left arm and shoulder. There was redness and tenderness of the left wrist and palmar surface. There was tenderness of the left knee with slight fluctuation and a floating knee cap. Active and passive motion of all extremities was painful. The patient admitted having sore throat three days previous to admission.

On February 20, there was marked disorientation, the patient was argumentative, the fever was lower, but the general condition was worse. The extremities were very painful. He objected strenuously to being moved. There were more petechiae and more redness of the left wrist. The blood sugar was 400 mg. per cent. Spinal fluid was normal. On this date, there was a murmur heard over the aortic area which had never been present before.

On February 21, the general condition was much worse. He was very drowsy; he would rouse to questions in the morning but roused with difficulty in the evening. His color was very poor and he was quite cyanotic. The râles at the base of both lungs had increased. The murmurs over the aortic area and the mitral area were softer. Both wrists were swollen and much more tender. The left knee was very tender. There was slightly more redness and swelling. There was a blood culture taken on this date.

On February 22, oxygen was started. The temperature curve rose steadily from 101 in the morning to 105 at midnight. He was very much worse. On the 23rd, his color improved under oxygen. There were no new petechial spots but those on the left arm and shoulder were larger and more numerous. There was some edema of the back. Cultures of the wrist and knee joints were taken on this date; no pus was found. The temperature and respiration rose steadily from 105 at midnight to 109 at 10:20 the next morning, when he expired.

Treatment of the patient was primarily symptomatic, and consisted in the use of penicillin in an attempt to control the infection. Insulin was prescribed in increasing doses in an attempt to control the hyperglycemia. Vitamins and parenteral fluids were used as supportive treatment. The diet was high in carbohydrates and proteins.

Post-mortem findings were: (1) hemochromatosis and cirrhosis of the liver, (2) hemochromatosis and fibrosis of the pancreas, (3) septic spleen, (4) cholelithiasis, (5) arteriosclerosis grade III of the aorta, (6) atrophy of the testes.

Mention should be made of nature's attempt to compensate for this extensive cirrhosis and the disturbance

(Continued on Page 86)

PEPTIC ULCER IN INFANCY AND CHILDHOOD
Report of Three Cases

ROBERT B. TUDOR, M.D.
Bismarck, North Dakota

HOLT,[10] in 1913, from a study of ninety-five cases of duodenal ulcer in infants below the age of one year, found that of sixty-five cases in which the age was given, 70 per cent of the patients were between the ages of six weeks and five months, nine occurring in the newborn. In 1922, Paterson[14] discovered in the literature 100 cases of duodenal ulcer in infants, and contributed two of his own. Proctor,[15] in 1925, in reviewing 1,000 cases of gastric ulcer and 1,000 cases of duodenal ulcer, found that in sixteen of the cases of gastric ulcer and in twenty-six cases of duodenal ulcer symptoms had been present since childhood. Butka,[4] in 1927, reported a ruptured gastric ulcer in an infant on the fourth day of life. Shore,[19] in 1930, reported a fatal perforated ulceration of the stomach in a male infant twenty-two months old. In 1932, Selinger[18] reported three cases of peptic ulcer in children under twelve months of age. Foschee,[8] in 1932, reviewed nineteen cases of gastric ulcer in children. In 1933, White[22] reported two chronic duodenal ulcers in children. In 1934, Smythe[20] reported two perforated gastric ulcers in newborns who lived six and seven days. In 1935, Tashiro and Kobayashi[21] reported a case of perforated duodenal ulcer in a child of seven. In 1940, Burdick[3] reported eight cases of peptic ulcer occurring at the Children's Hospital, Washington, D. C., from 1932 to 1939 out of 21,231 admissions and two cases seen in private practice. In 1941, Bird, Limper and Mayer[2] collected 243 cases of peptic ulcer in children from the literature. In 1941 Logan and Walters[11] collected fifteen cases of chronic gastric ulcer which had been recorded since Foschee's report in 1932, and contributed one of their own. Firman-Edwards,[7] in 1941, reported a case of a six-month-old child with cirrhosis of the liver who expired following a perforated gastric ulcer. There was no evidence of von Gierke's disease in the liver. In 1942, Newman[13] emphasized the importance of roentgen examination of the gastrointestinal tract in demonstrating peptic ulcer as the cause of obscure abdominal symptoms in children and added six cases to the literature. C. A. Stewart,[5] in 1943, reported four instances of ulceration in the gastrointestinal tract during the neonatal period. In two of the infants multiple gastric ulcers coexisted with erythroblastosis fetalis. Schwartz and Halberstam,[17] in 1943, successfully operated on an eleven-month-old male infant with perforated duodenal ulcer. In 1943, Benner[1] reported eight cases of peptic and duodenal ulcer which had been seen in the course of about 500 routine autopsies on infants and children at the Colorado General Hospital. One case was remarkable because of the association of ulcer with possible rhubarb poisoning. Two cases of apparently healed ulcer were included. Guthrie[9] found nine peptic ulcers in the autopsy material in the Glasgow Royal Hospital for Sick Children, between the years of 1914 and 1941, in a series of 6,059 postmortems on children under the age of thirteen (Table I). In 1944, Meiselas and Russakoff[12] reported a case of a bleeding peptic ulcer in a two and one-half months old child who subsequently expired. Donovan,[6] in 1945, reported ten cases of gastric and duodenal ulcers in infants and children, from the Babies Hospital, New York. Hemorrhage occurred in six of the ten cases. Perforation and pyloric stenosis were also observed. Rosenberg and Heath,[16] in 1946, reported a case of a gastric ulcer with perforation in one of premature twin boys. In this patient vomiting began on the ninth day of life. Brown stools and dark vomitus began on the thirty-sixth day. He died on the fifty-fifth day.

The etiology of peptic ulcers in infants and children in the majority is obscure. Prematurity has been mentioned as a cause. Cases have occurred in association with erythroblastosis fetalis. Holt[10] has emphasized that the age distribution of "marasmus" and peptic ulcers is similar. There may be an association between the development of ulcers and the onset of hydrochloric acid secretion in the stomach. The acidity of the gastric juice reaches a maximum within forty-eight hours of birth, when it is equivalent to that of an adult. Thereafter, it falls rapidly and remains

Presented at the North Dakota Pediatric Society meeting, Fargo, North Dakota, October 15, 1949.

low during infancy. Ulcerations have been reported in association with stenosis of the intestinal tract. They have also occurred during the course of hepatic disease, pancreatic disease, and erythroblastosis. Two cases have followed trauma, one following external trauma, and one following aspiration of the newborn respiratory tract. For years the association between severe systemic infection and peptic ulceration has been appreciated. Many organisms, including streptococci and tubercle bacilli, have been cultured from these ulcers. Extensive body burns are many times followed by peptic ulcers, probably because of the infection which is usually also present. Stimulation of the diencephalon will produce hyperemia of the gastric mucosa and will increase gastric motility, hypertonus and hypersecretion. In the adolescent group peptic ulcer may be a psychosomatic disease. It has been suggested[23] that there is a possible association between the anterior pituitary gland and peptic ulcer in adolescent boys.

TABLE I. CASES OF GASTRIC AND DUODENAL ULCERS OBSERVED IN 6,509 ROUTINE AUTOPSIES ON CHILDREN[1,9]

	Age	Sex	Diagnosis	Type of Ulcer
1.	2 days	Male	Pneumonia with Otitis Media	Duodenal Ulcer
2.	3 days	Female	Multiple Congenital Anomalies	Duodenal Ulcer
3.	3 days	Female	Hematemesis and Melena	Duodenal Ulcer
4.	5 weeks	Male	Melena and Hepatitis	Three Duodenal Ulcers
5.	2 months	Male	Pertussis with Pneumonia	Duodenal Ulcer
6.	10 weeks	Female	Melena and Otitis Media	Duodenal Ulcer
7.	10 weeks	Female	Frequent Vomiting	Duodenal Ulcer
8.	11 weeks	Male	Frequent Vomiting and Diarrhea for Two Days	Three Duodenal Ulcers
9.	3 months	Male	Marasmus	Two Duodenal Ulcers
10.	17 weeks	Male	Melena and Otitis Media	Duodenal Ulcer
11.	14 months	Male	Tuberculous Meningitis	Duodenal Ulcer
12.	3 years	Male	Rhubarb Poisoning	Duodenal Ulcer Massive Hemorrhage
13.	6 years	Female	Hemopneumothorax Following an Accident; Melena	Duodenal Ulcer
14.	9 years	Male	Tetanus	Duodenal Ulcer
15.	10 years	Female	Bronchopneumonia and Ruptured Appendix	Gastric Ulcer
16.	11 years	Male	Meningitis with Otitis Media	Duodenal Ulcer Massive Hemorrhage

TABLE II.

Age	Sex*		Type of Ulcer		Number Operated On	Symptoms		
	Male	Female	Duodenal and Pyloric	Gastric		Stenosing	Perforated	Bleeding
Newborn (0-14 days)	19	14	29	16	6	1	19	23
15 days-1 year	32	20	56	10	9	8	17	31
2-6 years	15	11	21	7	9	2	3	12
7-11 years	42	24	53	17	32	11	15	12
12-15 years	48	24	59	18	67	31	26	6
Totals	156	93	218	68	123	53	80	84

*In some of these the sex was not stated.

Ulcers[2] in the newborn, in whom the symptoms become outstanding within the first two weeks of life, have special characteristics. The great majority bleed seriously or perforate. In many the onset is precipitous without recognizable symptoms or signs. Except in a few cases neither clinically nor at autopsy is there evidence of intracranial injury or localized or generalized sepsis. The lesions are acute.

During the first twenty-four months of life beyond the newborn period, the nature of the disease changes. Although again the great majority of ulcers bleed grossly or perforate, there are often premonitory symptoms, such as refusal of feedings, evidence of abdominal pain, vomiting, occasional streaking of blood in the vomitus, sometimes occurring over a period of weeks or months before the onset of graver symptoms. Persistent pylorospasm or inflammatory or cicatricial pyloric stenosis is seen occasionally. Many of the patients are septic and marasmic.

Between the ages of two and six years recognized examples of peptic ulcer are very few.

As age advances beyond the seventh year, there is a rise in the number of cases recognized, with special accentuation on pyloric stenosis and perforation. Hemorrhage recedes into the background. Among the cases reported in this age group, the symptoms have often been present intermittently or continuously over a period of months or years.

Hemorrhage from stomach or bowel is the most characteristic sign of peptic ulceration in children. In the series of cases here reported, bleeding occurred in 48 per cent of the children under one year and in 29 per cent of the total series. Duodenal ulcer may cause spasm of the pylorus, so that the condition may suggest pyloric stenosis. Regardless of the age of the child, a complaint of epigastric pain occurring sometime after meals, particularly at night, relieved by the ingestion of milk or other food or by emesis, and accompanied by tenderness in the abdomen, should lead to a very strong suspicion of peptic ulcer. Indefinite abdominal discomfort, particularly if epigastric in situation, even if unaccompanied by other characteristic symptoms, may be caused by ulcer. Hyperchlorhydria is absent usually.

Pathologically, the ulcers seen in childhood are similar to those seen in adults. If they are chronic in type, the appearance in no way differs from that of chronic ulcers in adults. A striking feature in all acute ulcers is the absence of inflammatory reaction, the lesion being purely destructive. Duodenal ulcers invariably occur above the ampulla of Vater and are generally situated on the posterior wall.

Of 286 cases of peptic ulcer, 283 collected from the literature and three of my own, 218 were duodenal and pyloric and sixty-eight were gastric, a ratio of 3 to 1. Operations were performed in 123 patients. Indications for operation were pyloric stenosis, perforation, hemorrhage and uncontrollable symptoms (Table II).

Report of Personal Cases

Case 1.—P.L.Z. This patient was a white, male infant. The birth was apparently normal. The baby nursed normally and seemed to be doing well until the fifth day of life, when the abdomen became suddenly distended. At that time the child became cyanotic and very dyspneic. The temperature was 100.4° when the child arrived at the hospital. The child was in extremis when first seen. X-ray showed a large amount of air in the peritoneal cavity with the diaphragm displaced upward. The child expired one hour after admission to the hospital.

Postmortem examination showed a perforation of the upper end of the stomach through the greater curvature, through which gastric contents were escaping. The perforation measured 15 by 18 millimeters in diameter. The other abdominal organs were normal. There was partial atelectasis of both lungs.

Case 2.—T.E. This patient was a white male who was born one month prematurely. Birth weight was 5 pounds 2 ounces. On the second day of life he began vomiting bile. He passed meconium per rectum which contained squamous epithelial cells. The gastrointestinal x-rays showed a dilated bowel. On admission to the hospital he was an emaciated, jaundiced white male who had a feeble cry. There was moderate dehydration. Examination was essentially negative except for a distended abdomen. Chest x-ray was negative. The K.U.B. film showed a dilated large and small bowel with fluid levels. The baby was Rh negative. Hemoglobin was 116 per cent, and the white blood cell count, 8,200. The urine showed 3-plus albumin with 6 to 10 red cells and no sugar. Barium enema showed a stenosis of the sigmoid.

A transverse colostomy was done on the fourth day of life. The patient did well until the twentieth day of life. He was maintained with blood transfusions and given formula orally. The distal colon was irrigated with saline and mineral oil. The colostomy worked well at all times. He began passing blood from the proximal colostomy on the twenty-third day of life. Shortly after this he became distended and expired suddenly. Postmortem examination showed a perforated duodenal ulcer and a stenosis of the sigmoid.

Case 3.—A.B. This patient was a fourteen-year-old white male who had been complaining of abdominal pain since he was seven years old, and did not care to eat, especially at breakfast. Shortly after the pain began he had a tonsillectomy and adenoidectomy. In about six months he began losing weight and the pains seemed more severe. He would sometimes vomit intermittently for a month. He seemed to crave milk and chocolate. When the pain became severe, he would lie down, as he could not stand. His appendix was removed when he was eleven years old, without influencing the course of his illness. By the time he was twelve, he had become very nervous and would eat very little because he said "his stomach did not feel like it needed food." The pain continued until when first examined he had been vomiting for two months. He never had melena or hematemesis.

The family history was interesting in that both mother and father felt they had stomach trouble.

The patient was a well-developed, fairly well-nourished, white male. The temperature was 99°. Weight was 73 pounds. Blood pressure was 100/70. The skin was moderately dehydrated, but there was no general glandular enlargement. Head and neck were normal. The fundi were normal. Ears, nose and throat were normal. The heart and lungs were normal. The abdomen was diffusely tender. Genitalia were normal. Rectal examination was negative. Extremities were normal. Neurological examination was normal. Accessory clinical findings: hemoglobin, 88 per cent; urine normal; white blood cell count, 9,050. Stool specimens were negative for occult blood on four occasions. Intravenous pyelograms were normal. Gastrointestinal x-rays showed the duodenal bulb to be markedly deformed, with an ulcer crater in the center of the bulb and a second crater in the distal portion of the bulb. The patient fainted twice during the examination. Analysis of the gastric content showed free hydrochloric acid of 23 degrees and combined hydrochloric acid of 15 degrees.

He was treated with bed rest, small blood transfusions, 1:5,000 atropine sulfate, Amphojel, multiple milk feedings and a bland diet. On discharge from the hospital his weight was 80 pounds. The gastric analysis at that time showed free hydrochloric acid of 28 and combined hydrochloric of 14 degrees.

On his last examination three months after his admission to the hospital, his weight was 85 pounds, and the hemoglobin was 81 per cent. He was feeling very well and had no complaints. X-rays at this time showed some irritability and deformity of the duodenal bulb, but no definite ulcer crater was noted.

MUCIN-ALUMINUM HYDROXIDE-MAGNESIUM TRISILICATE

"Mucotin"-Harrower.—An antacid mixture of gastric mucin, dried aluminum hydroxide gel, U.S.P. ($Al_2O_3.xH_2O$), and magnesium trisilicate, U.S.P. ($2MgO.3SiO_2xH_2O$), containing the labeled amounts of these ingredients.

Actions and Uses.—A mixture of histamine-free gastric mucin, aluminum hydroxide and magnesium trisilicate has been found to be an effective combination for oral administration in the control of symptomatic gastric hyperacidity and as an adjunct in the treatment of peptic ulcer. Gastric mucin has been shown to impart to the mixture a more distinct protective coating effect on the gastric mucosa than can be demonstrated with the use of antacids alone. Gastroscopic studies indicate that the mucin-antacid combination definitely coats the ulcer crater and may remain in the stomach for over an hour after instillation of the mixture. The antacid effect of the rapidly reacting aluminum hydroxide and the more slowly but prolonged reacting magnesium trisilicate, imparts to the mixture the advantages of both these antacids. The presence of magnesium trisilicate is also believed to counteract the constipating effect of the aluminum hydroxide but the available evidence on this point is not conclusive.

Dosage.—There is as yet no definite evidence by which to determine the optimum exact proportions of the antacids to be used in the mixture, but observations thus far indicate that best results are obtained with preparations containing approximately 10 per cent of gastric mucin. A ratio of 1:1.5:2.75 for gastric mucin-aluminum hydroxide-magnesium trisilicate has been found to give good results. A tablet preparation of these proportions containing gastric mucin 0.16 Gm., dried aluminum hydroxide gel 0.25 Gm. and magnesium trisilicate 0.45 Gm. is recommended in doses of two tablets every 2 hours. The tablets should be well chewed and no fluids taken during the following half hour.

THE HARROWER LABORATORY, INC., GLENDALE 5, CALIF.

Tablets Mucotin: Each tablet contains gastric mucin 0.16 Gm. dried aluminum hydroxide gel 0.25 Gm. and magnesium trisilicate 0.45 Gm.—JAMA, May 7, 1949.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from the December issue)

There follows a chronological roster, essentially accurate, of the medical staff of the Second Minnesota Hospital for Insane (Rochester State Hospital) from 1879 to 1899, inclusive:

Jacob Eton Bowers	Superintendent	Jan. 1, 1879—Oct. 1, 1889
William Alonzo Vincent	Assistant Physician	Mar. 1, 1881—Aug. 1, 1883
Alexander Brodie Cochrane	Assistant Physician	Aug. 1, 1883—Dec. 1, 1884
Homer Collins	Assistant Physician	Dec. 1, 1884—Oct. 1, 1889
Robert McEwen Phelps	2nd Assistant Physician	Mar. 1, 1885—Oct. 1, 1889
	1st Assistant Physician	Oct. 1, 1889—Oct. 1, 1890
	Assistant Superintendent	Oct. 1, 1890—Sept. 12, 1912
J. Robert Eby (med. student)	Apothecary	June ?, 1888—Oct. ?, 1889
Harry Raymond Randall	Assistant Physician	Jan. 1, 1889—Oct. 1, 1889
Arthur Foote Kilbourne	Acting Superintendent	June 1, 1889—Nov. 1, 1889
	Superintendent	Nov. 1, 1889—Nov. 30, 1934
Lloyd Anson Faulkner	Assistant Physician	Oct. 1, 1889—Nov. 1, 1889
Nathaniel Morton Baker	Assistant Physician	Oct. 1, 1889—May 1, 1893
Sara V. Linton (Mrs. R. McE. Phelps)	Assistant Physician	Oct. 1, 1889—Feb. 1, 1898
Frederick Eduoard Franchere	Assistant Physician	Oct. 1, 1891—July 1, 1892
Eric Olonzo Giere	Assistant Physician	July 1, 1892—Oct. 1, 1892
George W. Moore	Intern	July 1, 1892—Oct. 1, 1892
	Assistant Physician	Oct. 1, 1892—July 1, 1893
—— Jackman	Assistant Physician	July 1, 1893—No record
Cyrus Bowers Eby	Intern	July 1, 1893—Dec. 9, 1893
	Assistant Physician	Dec. 9, 1893—Feb. 1, 1899
H. H. Herzog	Assistant Physician	Dec. 1, 1893—Feb. 1, 1899
W. H. Withrow	Apothecary	Dec. 1, 1893— 1898?
Mary Elizabeth Bassett	Assistant Physician	July 19, 1895—Feb. 28, 1896
—— Cheever	No Record	1896?
Rose Anne Bebb	Intern	July 1, 1897—Feb. 1, 1898
	Assistant Physician	Feb. 1, 1898—Mar. 3, 1900
Abraham Franklin Strickler	Assistant Physician	May 16, 1899—June 10, 1899
	Assistant Superintendent	June 10, 1899—July 10, 1899
Ernest Z. Wanous	Assistant Physician	May 19, 1899—July , 1899
	Assistant Superintendent	July , 1899—Feb. 1, 1902
Oscar C. Heyerdale	Assistant Physician	July 13, 1899—Aug. 1, 1912
	Assistant Superintendent	Aug. 1, 1899—July 1, 1937
Charles L. Chapple	Assistant Physician	Aug. 31, 1899—April 1, 1911

St. Mary's Hospital.—The first general hospital in Olmsted County and a large surrounding region, St. Mary's Hospital is believed to owe its inception to the tornado of August 21, 1883, which destroyed much of north Rochester, killed thirty-five persons and injured more than fifty others. All unaffected persons in

Rochester, physicians and laity, rallied to aid the sufferers, who were housed temporarily in private homes, in hotels, at the Academy of Our Lady of Lourdes and elsewhere. On the day after the storm a hospital was improvised in Rommel's Hall, in central Rochester, and Dr. W. W. Mayo was appointed physician in charge, and his son-in-law, Dr. D. M. Berkman (a veterinarian), an able organizer, was appointed steward. On the same day Mother Mary Alfred, Superior of the Sisters of the Third Order of St. Francis of the Congregation of Our Lady of Lourdes, volunteered aid in nursing the injured and delegated four sisters to that service.

To Mother Alfred the catastrophe gave so clear a vision of what a permanent institution for care of the sick could mean to the community that, not long afterward, she told Dr. Mayo that the sisters intended to establish and maintain a hospital in the city, and asked him to help plan the hospital and to take charge of it. The doctor tried to dissuade Mother Alfred: Public opinion would be adverse, since hospitals at that period were not in good general repute; the town was too small to support a hospital; the expense of construction and equipment would be great; and he himself, then in his seventieth year, was too old to assume the responsibility she asked. Mother Alfred nevertheless proceeded quietly with plans to raise the necessary money.

In 1887, Dr. Mayo having consented to serve, a tract of nine acres was bought as the hospital site, a mile west of the city post office and just outside the city limits at the end of Zumbro Street. In the next two years Dr. Mayo and his elder son, Dr. W. J. Mayo (C. H. Mayo was still in medical school), traveled widely to study hospital planning and management. In August, 1888, Joseph D. Billingsley, of Winona, contractor, began the construction. In the spring of 1889 George Weber and Granville Woodworth, of Rochester, assumed the contract, and in the autumn of that year completed the work. During the period of construction it was announced that the hospital facilities would be available to all physicians of good standing in the region, that the sick would be received regardless of race, creed or financial condition and that they might choose any physician they wished. When the building was nearing completion, plans were made for a ceremonial opening of the hospital on October 1, 1889, but as it happened the beginning was simple. On September 30, 1889, St. Mary's Hospital admitted its first patient, who was in need of surgical aid for cancer of the eye, and on that morning Dr. W. J. Mayo and Dr. C. H. Mayo performed the operation, with Dr. W. W. Mayo administering the anesthetic.

On the afternoon of October 8 the Olmsted County Medical Society held a meeting at the hospital, at which were present the members of the society, some of whom were physicians from counties neighboring Olmsted County, and invited guests. At the meeting Dr. W. T. Adams, of Elgin, Dr. A. W. Stinchfield, of Eyota, and Dr. H. H. Witherstine, of Rochester, were a committee who drafted and presented the following resolutions, which were accepted unanimously:

> WHEREAS, the Sisters of St. Francis have erected this beautiful and commodious hospital in the City of Rochester and we, the physicians of Olmsted County and adjoining counties, represented in the Olmsted County Medical Society, upon examination find it to be one of the finest and best arranged hospitals in the state, Therefore,
>
> Resolved, that it is worthy of the support and patronage of the medical fraternity of this vicinity.
>
> Resolved, that much is due to Dr. W. W. Mayo for his valuable suggestions with reference to the details of the hospital.

The ceremony of blessing the hospital was held on October 24, 1889, in the presence of a few invited citizens.

The new hospital was a three-story building of red brick with rough stone trim. It contained two ten-bed wards, one three-bed ward, one semiprivate room and two private rooms, a total capacity of twenty-seven hospital beds. Modern conveniences, which at that time were almost unknown in Rochester, were lacking. Four Sisters of St. Francis constituted the administrative and nursing staff and, frequently, the maintenance staff. Dr. Mayo and his sons were the physicians in charge. Miss Edith Graham (later Mrs. C. H. Mayo), of Rochester, the first trained nurse in the city, who had been graduated that year from the Woman's Hospital of Chicago and who was employed by the Drs. Mayo in their offices, gave the sisters lessons in professional nursing and became the first woman anesthetist at St. Mary's Hospital.

Not long after the hospital was established, Dr. W. W. Mayo began to reduce his professional activities, and he soon relinquished the chief responsibility to his sons. Until 1892 these two, "the greenest of a green crew," as they afterward described themselves, carried all medical and surgical services alone; in surgery, turn about, each acted as assistant to the other. They visited hospitalized patients early in the morning, operated from 7:30 a.m. or earlier until 1 p.m. or later, in the afternoon held consultations at the offices downtown, and were on call, and often at the bedside of patients, all night. In February, 1892, Dr. A. W. Stinchfield came from Eyota to join the Drs. Mayo in practice, in offices and hospital, and in the spring of 1894 Dr. Christopher Graham, of Rochester, recently graduated in medicine, became a member of the group and the first intern at St. Mary's. For three years these five physicians were the hospital staff. By 1899 the group included nine physicians.

For thirteen years Dr. W. J. Mayo and Dr. C. H. Mayo were the only surgeons at St. Mary's Hospital. When the hospital opened, the brothers, grateful to the Sisters of St. Francis for unique opportunity, declared that they never would "hold the knife outside St. Mary's Hospital," and they kept their word. Only on occasion of emergency or when they gave aid as surgeons at the state hospitals for insane at St. Peter and Rochester, did other operating rooms know them.

In its first three months, in 1889, St. Mary's Hospital received sixty-eight patients. There were 301 admissions in 1890 and 315 in 1891. The annual registration continued to increase gradually until, in 1899, the hospital received 938 patients. It is recalled that some months before the hospital building was completed, Dr. C. H. Mayo optimistically prophesied to Mother Alfred that in time the hospital would "get patients from all these towns around here," and that Mother Alfred hopefully but somewhat doubtfully agreed. Within three years patients were coming from Illinois, Kansas, Michigan, Minnesota, Missouri, Montana, Nebraska, North Dakota, South Dakota, New York, Ohio and Wisconsin. Within twenty years they were coming from nearly every state of the Union and from every continent of the world. In its first ten years two major additions were made to the hospital building. Since 1900 there have been six great additions, exclusive of St. Mary's Isolation Hospital, and corresponding expansion of services. In 1918 the sisters purchased the Lincoln Hotel, remodeled it and converted it into an isolation unit, which was opened as St. Mary's Isolation Hospital on June 14, 1918. Near St. Mary's, but not an addition to the hospital buildings proper, the unit provided additional hospital space and made possible an important extension of service.

Although from the beginning St. Mary's Hospital met with phenomenal success and usefulness as a self-supporting institution, its earliest years were difficult. At the time the hospital was planned, and when it was opened, hospitals were regarded by the general public as last resorts for the homeless and the destitute and were classed with prisons, insane asylums and county institutions, so that most persons would not consider entering a hospital as patients. To increase the difficulty, the project at first did not have the endorsement of all of the Sisters of St. Francis, nor of the Catholic community, who were in the minority in Rochester. Sectarian feeling was high, and there was hostility toward the hospital on the part of certain Protestants of the city. The situation was made more disagreeable by a wave of organized anti-Catholic propaganda, of the American Protective Association, that was sweeping the country at that time, and residents of the locality were either partisan or conservative. Most of the local physicians, although they esteemed the Mayos personally, were not inclined to associate themselves with a doubtful venture, and consequently an attempt to organize a general medical staff for the hospital was a failure. In addition, there were Catholics, and especially Catholics who had relatives in the medical profession, it is said, who felt that the hospital should not be staffed by Protestant physicians. It was even suggested that the hospital should be closed. Among both Catholics and Protestants, however, the close personal friends of Mother Alfred and of Dr. W. W. Mayo and his sons, knowing the sincerity of purpose with which the hospital had been planned and built, remained steadfast in their friendliness towards the undertaking.

In the early nineties, when the first addition to the hospital was being projected, a second wave of organized propaganda swept over the Northwest, and because of it the early opposition to St. Mary's was revived. The hospital once more was criticized as a Catholic agency and patients were advised not to go there for treatment. In Rochester several Protestant ministers and their congregations entered into the campaign. Homeopathic physicians, endorsed by the opposing ministers and congregations, in the autumn of 1892 opened a new hospital, the Riverside, which was received with enthusiasm. When Dr. W. J. Mayo and Dr. C. H. Mayo, faithful to St. Mary's Hospital, refused to become associated with the new hospital or to operate there, they again became the subjects of severe criticism, which again they accepted without comment. The local regular physicians of the region during this period remained essentially neutral toward St. Mary's and took no part in the management of the new hospital. At the end of three years the Riverside Hospital closed and sectarian opposition to St. Mary's ended.

Gradually the public came to appreciate the worth of St. Mary's Hospital, and physicians of the region other than the Drs. Mayo began to avail themselves of the privilege of bringing in their patients. Some of the patients who were brought could have been cared for satisfactorily at home, however, and these needlessly occupied hospital beds. From time to time others who had been exposed to contagious disease were admitted inadvertently, and frequently moribund patients, were brought in. The lack of space for the seriously ill, the worry and difficulty of dealing effectively with contagious disease, and the increase in the annual hospital mortality, not great but a cause for anxiety, after a few years caused the sisters, about 1895, to take the courageous step of establishing a new ruling: that the facilities of the hospital still should be available to all physicians in good standing, but that no patient should be admitted who had not been examined by one of the Drs. Mayo. The rule was carried out tactfully, the Drs. Mayo simply assuring the sisters and themselves that the privileges of the hospital were not abused and that its welfare was not endangered.

St. Mary's Hospital opened as a general hospital, but the influx of surgical patients and the lack of room for them soon caused the sisters to change the institution to an exclusively surgical hospital until sufficient space could be provided for general hospital work. It was not until 1914, after six additions had been made to the building, that there was marked increase in facilities for the medical treatment of patients in the hospital.

In a booklet, *A Souvenir of Saint Mary's Hospital,* issued by the sisters in 1922, the following dedication appears: "To the memory of Mother Mary Alfred, O.S.F., Foundress of Saint Mary's Hospital, and of William W. Mayo, M.D., who directed and organized the foundation, this volume is affectionately dedicated." Sister Mary Hyacinth was in charge of the hospital until Mother Mary Alfred was appointed superintendent on November 5, 1889. Sister Mary Hyacinth replaced Mother Mary Alfred on August 28, 1890. Sister Mary Joseph, who succeeded Sister Hyacinth, on September 9, 1892, guided St. Mary's Hospital until her death on March 29, 1939, when Sister Mary Domitilla became superintendent.

The progress of St. Mary's Hospital has continued without interruption (1949), as has its relationship with the Drs. Mayo and their associates, a group which since 1914 has been known officially as the Mayo Clinic.

The Riverside Hospital.—The Riverside Hospital, mentioned earlier in this history, functioned in Rochester from November, 1892, into September, 1895. The hospital was established by Dr. W. A. Allen, an esteemed pioneer homeopathic physician who settled in Rochester in 1872, and Dr. Charles T. Granger, a native son of Olmsted County. Dr. Granger was graduated with distinction from the Hahnemann Medical College of Chicago in March, 1892, was licensed in Minnesota after passing a creditable examination, and in April entered into partnership with Dr. Allen. In July, 1892, the two doctors bought a large residence on Line Street, East Rochester, remodeled it and equipped it as a hospital, modern in its day, and employed a competent nursing staff. The hospital was well received by the press and by the public, and its wards, medical and surgical, soon were filled with patients. As was the custom in that period, an occasional patient published in a local newspaper an expression of gratitude for the good care received.

A group of Rochester women, many of them of the Universalist congregation, organized the Riverside Hospital Aid Society, to help supply equipment for the wards and to prepare surgical dressings. In March, 1894, a group of 175 friends of the hospital surprised Dr. Allen with a social gathering on his sixtieth birthday and presented him with a large new homeopathic medicine case.

By the summer of 1895 the operation of the hospital had become impracticable. In the middle of September Dr. Allen, then mayor of Rochester, announced that he was moving to Saint Paul, to enter practice with Dr. O. H. Hall, late of Zumbrota, that he would leave his local practice in the hands of Dr. Granger, but that he would return to Rochester each week in order to oversee construction of the new city sewer, which was under way.

On September 27, 1895, the *Rochester Post* stated that because of Dr. Allen's departure it had been decided to close the Riverside Hospital, which henceforth would not be open for the reception of patients. In March, 1896, Dr. Allen resumed residence and practice in Rochester. After August, 1896, he and Dr. Granger were not in partnership.

The Beginnings of the Mayo Clinic

The Mayo Clinic was not established. It is a development that had its beginnings in the private general practice of one competent pioneer physician and surgeon, Dr. W. W. Mayo, who came to Rochester, Olmsted County, in the spring of 1863. From a private practice there grew a private group practice in which individualism in co-operative form was fostered and in which it has been maintained.

Dr. W. W. Mayo came to Rochester from Le Sueur as examining surgeon on the

Enrollment Board of the First Congressional District of Minnesota. When he left the board two years after his appointment, he opened an office on Third Street for private practice. In the next twenty years he changed his office location some seven times and on several occasions entered into partnership for medical practice with one local practitioner or another. These associations were short lived. From the beginning he won the confidence of laity and profession and gradually built up a practice which by the early eighties was one of the largest in southeastern Minnesota.

In May, 1883, shortly before his elder son, Dr. W. J. Mayo, returned home from medical school to begin practice with him, Dr. Mayo established offices over the drug store of George Weber, on the corner of the then Main Street and Zumbro Street, where the C. F. Massey Company's department store now is. In the next thirteen years there were, at intervals of about two years, extensive renovation, enlargement and re-equipment of the offices, to meet the requirements of the rapidly growing practice. A major change was made just before Dr. C. H. Mayo came home from medical school to join the family team, in 1888, and comparable changes were made in 1892, when Dr. A. W. Stinchfield became a partner, and in 1894, when Dr. Christopher Graham joined the group. In 1893 equipment was improved by addition of an expensive Leitz microscope, imported from Germany, which was used in a small upstairs room. In 1896 the *Olmsted County Democrat* gave an enthusiastic description, under the heading, "Complete Offices," of the quarters of the Drs. Mayo, Stinchfield and Graham, who were then occupying additional space both on the ground floor and upstairs, and stated that Weber and Heintz, whose drug store adjoined the offices, also had increased their space to make room for their prescription department. In 1898 Dr. M. C. Millet and Dr. Gertrude Booker joined the Mayo group. On November 29, 1900, the firm moved into quarters that had been especially created for them on the ground floor of the new Masonic Temple, diagonally across the junction of Zumbro Street and Main Street from the former offices. There were now general reception rooms, a reception room and library, "for visiting physicians who have come here with cases or to attend clinics at St. Mary's," a clerical and business office, consulting and examining rooms for the staff physicians, a dark room for "eye cases," and a small laboratory under the charge of Dr. Isabella Herb, who had begun work in January, 1900, as pathologist and anesthetist at St. Mary's Hospital. In this laboratory, routine tests of blood, urine and sputum were made. There was an x-ray room, which was not put into active use, however, until Dr. H. S. Plummer joined the group in 1901. In the fourteen years of the firm's occupancy, the offices were enlarged within the limits of the Masonic building and by the use of detached rooms in buildings near by.

It is important to note the fact that Dr. W. W. Mayo and, in due time, his sons and later associates scrupulously maintained office hours, and that by so doing they built up a large office practice—this in a period when the average physician maintained an office only as a starting point for his daily rounds of visiting patients in their homes.

In his early practice Dr. W. W. Mayo performed surgical operations in the homes of his patients, as was the custom of the time. By the late seventies he was utilizing rooms in one of the small hotels of Rochester for surgical operations and for postoperative care of patients from a distance, who by then were coming to him in considerable numbers. In the eighties, as stated earlier, he had a small private hospital of eight or nine beds in the home of a Mrs. Carpenter, a practical nurse in north Rochester. He was recognized in those years as a versatile and courageous surgeon, and he occasionally invited interested physicians from neighboring towns and from Saint Paul and Minneapolis to observe surgical operations, especially ovariotomy. Those occasions were the first surgical clinics held in Rochester, although they were not called clinics. After the sons joined their father, the surgical practice especially increased. They had a natural bent for surgery. They were eager for new knowledge, and they traveled, alternately, to study and to observe the work of other surgeons, in Chicago and in Boston, New York, Philadelphia and elsewhere. In those early years Christian Fenger, Arpad C. A. Gerster, Robert Weir, William T. Bull, Frederick Lange, Robert Abbe, William W. Keen and Joseph Price and many others taught them much. Soon they traveled abroad. They attended meetings of medical societies, local, regional, national and international, and early began to contribute reports and papers to the programs and to medical journals.

By 1890 many local physicians were coming to observe the surgical work of the Mayo brothers. In the newspapers of southeastern Minnesota of the nineties are to be found little items to the effect that Dr. ———, of Eyota, or Plainview or Wabasha, for example, or a group of doctors, had spent a day or several days in Rochester "attending clinics at St. Mary's" or "observing operations at the Drs. Mayo." In these years physicians from near-by states began to come, bringing patients and staying to observe the surgical clinics. Drs. A. J. Oschner and J. B. Murphy, of Chicago, were among the first visitors to come from large cities. Well before 1905 there were physicians from the East, and from Europe, among the observers and among the personal friends of members of the firm. Evidence of nation-wide recognition of the work in Rochester is found in the unanimous election, in 1905, of Dr. W. Mayo to the presidency of the American Medical Association. Visiting physicians in Rochester began to speak of the Mayos' clinics, of the Mayos' clinic at St. Mary's Hospital, and soon of the Mayo Clinic. St. Mary's probably was the first, as early as 1899, to refer to "clinic patients."

By the early or middle nineties, surgery, at first one part of a general practice, had become the predominant part of the Mayos' work, and it so remained for nearly twenty years. In 1904 only fourteen patients were treated medically at St. Mary's Hospital, which had opened in 1889 as a general hospital. As stated earlier, it was not until 1914 that special provision was made for the medical care of patients in the hospital. That year marked the increasing interest of the Drs. Mayo and their associates in the science and art of internal medicine and the beginning of continuous development of all facilities for the medical care of hospitalized patients.

The educational work in medicine and surgery, which since 1915 has been carried on by the Mayo Foundation for Medical Education and Research, affiliated with the University of Minnesota, began in the early nineties when a few medical students, usually local young men, spent their summer vacations at St. Mary's, observing operations and working as orderlies and as volunteer helpers in the little laboratory. Perhaps the first graduate observer of long attendance was Dr. W. A. Chamberlain, of St. Charles, who in 1898 spent several months in Rochester. Gradually the Drs. Mayo took in young graduate physicians as clinical helpers and as assistant surgeons, training them carefully themselves. For some years these men were known as interns, externs, and assistants. It was in 1906 that weekly staff meetings were inaugurated by Dr. H. Z. Griffin, who had joined the Drs. Mayo that year. These meetings and resulting and related special staff conferences and seminars have had an important part in the growth of medical education in the clinic and the foundation.

President's Letter

1950

ORDINARILY a calendar doesn't mean much to a physician. Except for seasonal complaints—the spring epidemics, the late summer allergies, and the many hazards that winter brings—the physician's life is dictated more often by his wrist watch than his calendar. But, like everyone else, physicians on January first are jolted out of their routine into an evaluation of the year past and predictions and plans for the year ahead.

The Minnesota State Medical Association can look back on 1949 with satisfaction. It has been a good year. We have been able to distinguish our sociological, as well as our medical and scientific responsibilities, and to minimize neither. This has come about through the devoted and high-principled leadership that the Association was fortunate enough to gain, and through the active co-operation of the membership.

In 1950, I feel sure, we can expect continued attempts to negate recognition of medical advances and to turn medical care into a commodity. This to be sold or doled out, according to nebulous plans, made both inside and outside the government, by individuals who assume that an interest in the subject—either sincerely humanitarian or hypocritical and selfish—and/or their status as *recipients* of medical care are all the qualifications they need to be medical experts.

In addition, then, to our primary responsibility to the patient, to provide him with increasingly better care, we are faced with usurpation of medical practice that would transform it from a profession into a business.

It is our prime obligation to save ourselves and our patients, and medicine and the public of the future, from this eventuality. In accomplishing this objective, we are fulfilling more than one requirement of good citizenship. For the physician, in convincing his fellow men that it is to their best interest to reject proposals contrary to the American way, must mingle more in his community than, perhaps, has been his custom. In fending off injurious legislation, the doctor will find himself marching regularly to the polls and aiding in the selection of legislators, not politicians.

It is an honor to have been elected to the highest office of the Minnesota State Medical Association during this time of crisis, when the health of the nation is precariously balanced between progress and deterioration, and when the action we take, as individuals and members of an association, may well influence the choice.

My best efforts are pledged to maintaining the ethics and standards of the profession and in interpreting them to the people of Minnesota in terms of their own health and happiness.

F. J. Elias.

President, Minnesota State Medical Association

THE YEAR 1950

IT IS difficult, in facing the new year, to be complacent about the state of affairs in our own country and the world in general.

The estimated federal deficit of 5.5 billion dollars is disconcerting to one who believes in the balancing of budgets. With high production and employment we should be paying off on our huge national debt rather than further increasing it. It is obvious that the only way to balance the budget is by increasing taxation or reducing expenditures. Economists say that high taxes have already resulted in disappearance of risk capital which has resulted in lending by the government rather than by private capital. Taxation has well nigh reached the point beyond which there will be diminishing returns. While visible taxes are burdensome, the invisible ones which are present in everything that is bought are insidious, in that the public is not so conscious of their existence and is not sufficiently spurred on to demand government economy. Sufficient demand on the part of the public for the need of government economy is the only influence which will affect Congress and our State legislatures.

Ways have been pointed out for effecting economy in government; the Hoover report for one. Its recommendations have not been followed. Federal subsidy of states for activities which are state responsibilities foster extravagance. The temptation for the states to match federal subsidies seems well nigh irresistible. The citizens of each state are paying for both expenditures. Price pegging by the government, while it artificially assists one group, only increases the cost of living and taxes. The more the artificial regulation of our economy, the greater the number of government employees needed.

Our own people are sick and tired of war. How much more so must be the people of the rest of the world. And still war and rumors of war are in the limelight—due almost entirely to communism. The disturbing element we call communism, and it is so self-named, actually consists of minority groups headed by the most diabolic despots the world has ever known; despots who have acquired control of governments and maintain themselves in power by force, intimidation and deceit. Every effort is made to destroy all religion, and love for God and fellow man is simply absent. There can be no room in our country for communists whose avowed purpose is to destroy our democratic form of government by force and intrigue.

We are among those who see little distinction between the aims of communism and socialism. Both aim towards the equal distribution of this world's goods and, therefore, the stifling of incentive and the suppression of industry. A real communism has never existed. We have a typical example of what near socialism can do to the economy of a nation like England. The recent reversal of public opinion away from socialism in New Zealand and Australia is indicative of what can happen in a democratic country and of what may happen in England. Must we go further into socialism before we realize that, human beings being what they are, it just will not work?

We are among those who believe that right will triumph in the end. Our country has muddled through many a crisis, and we believe we shall come through our present difficulties. Communistic régimes, based as they are on ruthless force, just cannot continue indefinitely. Citizens of all countries are much the same in their make-ups and, although temporarily misled or dominated by false leaders, have the same hopes and desires. It is our fervent wish that the year 1950 may show evidence of wisdom in the conduct of our government and more justice and peace throughout the world.

ISOLATION AND QUARANTINE REQUIREMENTS

HEALTH department regulations for isolation and quarantine help in the control of communicable disease but the relative importance of quarantine should be kept in mind to avoid neglecting more fruitful measures. These include diagnosis, treatment, and disinfection concurrently and terminally; reporting and epidemiological investigation to discover sources of infection, carriers, missed and suspected cases; individual protective measures such as vaccination and immunization against smallpox, diphtheria, whooping cough, tetanus, typhoid, and other diseases; community preventive measures such as sanitary water supply and sewage disposal, and pasteurized milk and cream; and most important public health education to stimulate people to take advantage of preventive medicine before disease develops. Quarantine and isolation requirements may benefit the ill patient more than the community by reducing his chances of contracting cross infections.

Regulations must be based on knowledge of the disease in question and they change as our knowledge changes. As in other medical fields, however, there occasionally appears the danger of the more science, the less art. Considerable emotional content is linked to quarantine procedures, whose origins date from early plagues, pestilence, superstitions, and hysteria. This partly accounts for slowness to change regulations.

Today public opinion as to the reasonableness of quarantine is still important for practical application. An acceptable compromise between the dictates of science and common sense, therefore, is frequently the result when rules are adopted. Because conditions vary so greatly throughout the State as to available personnel and interest for operating public health programs, the regulations of the State Board of Health set minimum requirements only and local boards of health have authority and are encouraged to add whatever additional precautions seem necessary.

In recent years quarantine regulations have become more liberal and, happily, more uniform in all states. Increasingly consideration has been directed to scientific essentials, clarifying the handling of those persons definitely infected, the cases and carriers; those possibly infected, the contacts; and the general community. Minnesota's regulations have followed this trend, sometimes in the teeth of considerable public feeling against liberalization, and sometimes only after some pushing from others for more lenient rules.

Two of the acute communicable diseases, scarlet fever and poliomyelitis, illustrate these trends. Scarlet fever in recent years has been mild, and responsive quickly to newer methods of treatment. Experience has demonstrated the futility of quarantine in stopping the spread of streptococcal respiratory infections, yet joined with other measures for control, some regulation is accepted as necessary by everyone. Minnesota now requires isolation of the patient for the duration of illness, with a minimum of seven days from onset. Close contacts, if children, are quarantined for the same period, while adult contacts if well are not restricted unless local authority so decides.

In poliomyelitis, regulations have admittedly not controlled the disease while conversely impeding the best use of hospital facilities. Following a national conference in 1949, state health authorities everywhere, including Minnesota, are modifying their regulations so that patients with poliomyelitis are isolated for seven days from onset or the duration of fever if longer, and contacts are freed from unnecessary restrictions.

Interestingly, regulations for isolation of infectious cases of tuberculosis, Minnesota's most serious communicable disease, are being strengthened and clarified. The control of chronic diseases such as tuberculosis, where infected persons may remain dangerous to their associates for long periods of time, even years, may be more directly influenced by isolation and quarantine regulations than in acute self-limited diseases. On the other hand, it is difficult to attribute much of the control of typhoid fever that has come about in Minnesota to the regulation by statute of those few hundred typhoid carriers listed in Health Department records, who presumably excrete typhoid germs for years with little change in their mode of living.

It must be accepted, in conclusion, that changing knowledge will bring changing practices. In hardly any other field of human health have there

Special Announcement

MSMA ANNUAL DUES

Following the recommendation of the Finance Committee, the House of Delegates of the Minnesota State Medical Association voted May 8, 1949, to continue the $10 assessment for 1950, and thereafter make it permanent by amending the Constitution to raise the dues to $30 per capita.

Members of the Minnesota State Medical Association are hereby notified that dues for this year will be a total of $30, and pending House of Delegates action at the annual meeting, June 12, 13 and 14, dues for the Minnesota State Medical Association will be permanently $30.

been such great changes in recent generations as in that of communicable diseases; quarantine regulations must expect adaptations in light of changing circumstances.

D. S. Fleming, M.D., Chief
Section of Preventable Diseases
Minnesota Department of Health

DEFICIT GOVERNMENT SPENDING

OUR FEDERAL debt is now 252.7 billion dollars or $1700 per person. Whereas, in 1947 the treasury showed a surplus of three-quarters of a billion and in 1948 a surplus of $8,419,469,844; in 1949 the deficit was $1,811,-440,048, and for the fiscal year 1950 there is an estimated deficit of $5,500,000,000.

It was Lenin's advice to let the capitalistic countries spend themselves into bankruptcy. Are we following his advice?

The responsibility for the deficit lies, for the most part, with Congress. However, we have a president who, instead of acting as a brake to spending, is continuously advocating more spending and higher taxes. Lobbies for special favors for numerous groups of citizens share in responsibility for the present extravagance of government. States that match federal subsidies with the idea that they are getting something for nothing also are to blame.

If some evidence of statesmanship in federal and state governments doesn't make its appearance in the near future, the usual result of deficit spending, bankruptcy, will inevitably follow with untold universal suffering.

Public opinion is a powerful factor in correcting poor government. The public's attention is being called through various publicity channels to the senseless extravagance of the federal and state governments. We, the people, can put an end to deficit government spending by informing legislators of our wishes.

COLDS AND ALLERGY

THE COMMON cold is responsible for more loss of time among employes than any other single disease. Medical science has been unable either to prevent or cure the common cold, and the thread-worn saying that a cold untreated will last two weeks and treated will last a fortnight is only too true.

The fact is, we don't understand any too well what a cold actually is. It is generally accepted that it is a virus infection of the respiratory tract which is followed by secondary bacterial invaders. There is reason to believe that the cold virus is present constantly in the upper respiratory passages in at least some persons, and we know that a variety of bacteria are present at all times in all nasal cavities. If the cold virus is ever present, we must assume a natural or acquired immunity in the absence of symptoms of a cold. The existence of the lack of immunity to the cold virus explains the rapid spread of colds to 100 per cent of an isolated community upon the exposure to one with a cold. The well-known frequent return of colds in certain individuals argues a short-lived immunity or the existence of more than one cold virus.

The rôle of exposure to drafts and chilling in the development of a cold is not clear. It is known that chilling the body causes a reflex vasoconstriction and lowering of temperature in the nasal mucous membrane. Does this cause a lowering of local resistance which allows a cold virus that is present to multiply? On the other hand, some individuals daily exposed to cold and chilling seldom contract colds. What is more, experimental inoculation of human beings and animals with cold virus can be accomplished without the element of chilling.

Recent literature has called attention to the probability of a relationship between allergy and the common cold.* The manifestations of a coryza are identical to the allergic response in hay fever. A cold may be considered an allergic response in an individual susceptible to the cold virus. It has been shown that allergic individuals—those who suffer from hay fever, asthma or food allergy—contract colds more often than normal persons. These constitute the cold-susceptible group who are repeatedly contracting colds. The authors state, "The response of the physically allergic person to these environmental factors (i.e., chilling of body, wetting of feet) may very well result in an outpouring of histamine into various shock centers throughout the body, particularly the respiratory tract, in sufficient quantity to destroy the local defense mechanism preparing the tissues for acceptance of the virus of the common cold." This assumes that the cold virus is already present. The authors state that secondary bacterial invaders are just as likely to be activated. On the other hand, they call attention to the fact that colds during attacks of hay fever are not common, so there must be other factors besides the condition of the mucous membrane. Immunity, though often transitory, does result—otherwise recovery from a cold would not take place. With exposure to enough antigen, all persons can be made to react in an allergic manner. It is easier, however, to consider the cold-susceptible person as one who is allergic to the cold virus. Again, according to the authors, 80 per cent of cold susceptible persons have other allergies or come from families with allergies, and 100 per cent of such persons have hyperplastic disease of the upper respiratory tract.

---

*Fox, Noah, and Livingston, George: Role of allergy in the epidemiology of the common cold. Arch. Otolaryng., 496:575-586, (June) 1949.

It is reasoned that if, at the first appearance of the allergic response indicative of the onset of a cold, an anti-histaminic is taken and the nasal mucous membrane returned to normal or near normal, the cold might be cut short by preventing the development of the secondary bacterial invaders. Reports of trial use of various anti-histaminics in sizable groups of individuals indicate that colds can be thus cured in twenty-four to forty-eight hours in about 50 per cent of cases and alleviated in an additional 25 per cent. In about 25 per cent, the method is useless. Interestingly, some anti-histaminics are effective for some individuals and not for others. Some, of course, produce undesirable side reactions, such as sleepiness, and some do not.

The Food and Drug Administration has released a number of anti-histaminics for over-the-counter sale at drug stores, providing the printed instructions as to dosage meet with its approval. The newspapers are running full page advertisements of these preparations. It will be difficult for the biological houses that are attempting to limit the sale of their anti-histaminics to prescription trade to resist the temptation to share in the millions of dollars which will be spent in over-the-counter sales.

The anti-histaminics containing neo-hetramine are said to produce fewer side effects and are less likely to have harmful effects. Probably small children should not be given any anti-histaminics.

Reports indicate, however, that something has been found at last which will reduce the duration of the common cold. If it is only 50 per cent effective, it will be worth while.

CO-OPERATION IN THE TREATMENT OF TUBERCULOSIS

The skills required in the modern treatment of pulmonary tuberculosis are many and varied. The frequent association of tuberculous and nontuberculous complications adds further to the need for practically all medical and surgical specialty services, not excluding research facilities. The closest possible association and interchange of information and ideas between the tuberculosis and general hospitals is for these reasons evidently desirable. Particularly is it desirable for the teaching hospitals, which are the principal centers of clinical research, to maintain active contact with tuberculosis institutions, even to provide a quota of beds for the interchange of patients. CARL MUSCHENHEIM, M.D., *Am. Rev. Tuberc.*, July, 1949.

THE RATIONALE OF BLOOD TRANSFUSIONS IN THE TREATMENT OF THE TRUE TOXEMIAS OF PREGNANCY

(Continued from Page 41)

such a condition. Among putatively full-blooded Ute Indians, 98 per cent of them belong to Group O. At one time these Indians were a pure Group O people. As a result of crossing with the white man, there is now, however, a small amount of Group A among them. Among the Blackfeet Indians, we have a high percentage of Group A—there are about 80 per cent who belong to Group A. It is reasonable to assume that these Indians were at one time a pure Group A people, and when you find Group O among them, it is a result of crossing either with other Indians, the white man, or the Negro. O is the only other type found among them. All Indians and all Eskimos who have been examined are Rh positive. I have inquired among the Agency physicians in the Indian tribes I visited in the United States, Canada, and Alaska about the incidence of erythroblastosis fetalis and toxemia of pregnancy, and it is the general impression that the incidence is extremely low. Dr. Schrader said he did not recall finding any toxemia of pregnancy among full-blooded Blackfeet Indians. The records were checked, and it was found that among the Blackfeet Indians there is little recorded toxemia of pregnancy as follows:

Eclampsia	0.3 cases per 1000 pregnancies
Nephritis	3.0 cases per 1000 pregnancies
Hyperemesis Gravidarum	1 case per 1000 pregnancies

What is the explanation? Certainly these findings do not go against, but rather agree, with the theory presented by Dr. La Vake.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics

WHITAKER & BAXTER REPORT PROGRESS

Visualizing compulsory health insurance as a "key political issue" in the next Congress and in the congressional elections, Whitaker & Baxter, the AMA's National Education Campaign directors, reported on progress to date at the Interim Session in Washington, December 6.

The two-point program of the campaign, as defined last February, was: (1) To defeat the compulsory health insurance legislation pending in congress; and (2) to put a permanent stop to the agitation for socialization of the medical profession by alerting the people to the costly consequences of such a program, and by providing the finest type of voluntary health insurance for all in need of prepaid medical protection.

Plan "Simple"

Whitaker & Baxter explained the plan of their campaign as "simple and involving only one basic requirement—to get the truth about the advantages and splendid accomplishments of American medicine, and about the disadvantages and dangers of government-medicine, to the people, together with factual proof in both cases."

The techniques used have been: a nationwide pamphlet distribution campaign, a vigorous publicity campaign, a speaking campaign and an endorsement drive. Fifty-five million pieces of campaign literature were prepared and distributed and more than 65,000 posters of "The Doctor" were mounted in hospitals, clinics, bus and railway stations, business buildings and anywhere else that would afford the public a view of the famed Fildes' painting with its challenging inscription, "Keep Politics Out of this Picture."

The endorsement campaign has been rewarded with the active, public support of 1,829 national, state and local organizations.

End result of the campaign thus far, according to Whitaker & Baxter, is: "The proponents of government medicine made a strategic retreat, and pigeonholed their legislation for the current session of Congress."

Lest too early optimism result from this report, Mr. Whitaker and Miss Baxter cautioned:

> "Although broad public disapproval of the government-medicine program is widely acknowledged—and although the Presidential plan to give its creator, the federal security administrator, cabinet status, was soundly defeated in a test of the same grass roots convictions—the administration is yet unconvinced."

LEGION COMMANDER SCORES TAX MEDICINE

> "The American Legion is opposed to national health insurance because it would stunt the growth and genius of the medical profession," the Legion's national commander said, December 8, at the Interim Session, "and because it would add another link to an already long bureaucratic chain."

George N. Craig issued this statement prior to an off-the-record address before the Conference of County Medical Society Officers.

> "Whether you call it state medicine or socialized medicine, it is still political medicine," he added. "Under such a system, the government is the boss, and the individual is no longer free to apply his initiative and imagination to the advantage of the profession and patients alike. Inevitably, the scientist is supplanted by the politician who in turn must dispense his services on a plane of partisan patronage."

WHY NOT INCLUDE PETS IN SCHEME?

The *Wall Street Journal* can see no reason for excluding quadrupeds from the government's manifold schemes for medical care, pensions and various other forms of security.

Recognizing that many families are unable to provide systems of annuities and the like for their pets, the *Journal* takes, for instance, the cat:

> "The most deserving of cats might thus be left, purely by accident, in destitution while the less deserving loll in luxury."

Happily, there is a solution, the editorial goes on to point out:

> "The only way to correct this inequity is for the cat pensions to be provided by the federal government on a uniform and non-contributory basis. And to remove further inequities, the same should be done for family canines, who are often more loyal and loved, and for the bovines and equines, who are certainly more useful than cats.
>
> "Why should one dog have the best of food and medical care whilst one more unfortunate huddles in alleyways?" asks the *Journal*, with as penetrating a social analysis as may be found anywhere in Fair Deal campaign literature. "Under nationalized veterinarianism there would be no dependence upon biological pedigrees."

No Restraint on Budget

Pooh-poohing the notion that the cost would be prohibitive, the *Journal* reminds its readers that both the Secretary of the Treasury and the Director of the Budget have made it clear that in dealing with welfare matters there must be no restraint because of budget limitations.

The editorial concludes with this stirring paragraph:

> "Doubtless the Senate Finance Committee, which plans a study of the whole pension system, will consider both the justice and the vote-getting potentialities of some such plan. Considering what we receive from the cow while she is young and productive, who suggests society is not her debtor when she is superannuated?"

BRITISH FINANCE CHIEF OPTIMISTIC

Sir Stafford Cripps, British chancellor of the exchequer, is optimistic about the financial fate of England under what he prefers to call "a mixed economy."

The "busiest man in England" was interviewed recently by an editor of *U. S. News and World Report* and described himself as "not quite so socialistic perhaps as some of my American friends."

During the course of the interview, he said:

> "But of course nationalization is not in the least likely to happen in the many private-enterprise industries that exist, *other than those which are basic to the economy."*

Asked his opinion on the trend of America toward more and more social security benefits and the soundness of this trend, in view of the fact that "in a democracy . . . people can vote themselves bigger and bigger benefits," Mr. Cripps hedged thusly:

Give Up Democracy?

> "That depends upon the responsibility of the democracy. Of course if a democracy takes so irresponsible a view of its obligations that it only regards the exchequer as a deep till into which it can perpetually dip its hand, I should personally suggest giving up democracy!"

Continuing, he said:

> "But that is not how we look at it in this country (England). We feel that it is quite possible, by giving people the information and the knowledge of economic facts, to instill into them a realization that they themselves are in fact paying for their own social benefits by taxation and by other means, and that therefore they must exercise restraint in the way in which they utilize those benefits and also in the amount of them they demand."

He neglects to add why the people of England have not been generally informed that the dollar a week they pay, which supposedly finances medical and related services, is actually channeled to "cash benefits," such as unemployment insurance and funeral expenses. Seventy-eight per cent of the cost of the health scheme comes out of general taxes and, from this fact, it may be deduced that the British public has no accurate knowledge of where tax money goes, and is actually being misled concerning the cost of the medical care program.

HOSPITAL OCCUPANCY RATE LEVELING

From a study of more than one hundred nongovernmental hospitals of varying size throughout the country, it has been ascertained that occupancy is continuing to level off from the peak of 1946.

"And there seems little evidence to indicate that this trend will change significantly in either direction," states Richard D. Vanderwarker, director of the Passavant Memorial Hospital, Chicago, Illinois.

Costs Rising

Considering the hospital's patient load as a relatively stable factor, Mr. Vanderwarker goes on to examine the rising costs of operating hospitals. Among the causes he cites are: wages, which, he feels will continue to rise because (a) there will be continuing pressure for hospitals to meet prevailing wages paid in industry and commerce, and (b) the market value of professional personnel services is increasing; the cost

Minnesota Academy of Medicine

Meeting of October 12, 1949

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, October 12, 1949. Dinner was served at 7 o'clock, and the meeting was called to order at 8:20 p.m. by the President, Dr. J. A. Lepak.

There were fifty-five members and six guests present.

Dr. Lepak asked Dr. H. S. Diehl to introduce Dr. Leslie Banks, of Cambridge, England, who gave a short talk and answered questions on the present socialized medicine program in England.

Dr. Carl B. Drake read the following memorial to Dr. James Gilfillan.

JAMES S. GILFILLAN
1869-1949

Dr. James S. Gilfillan was born April 15, 1869, the son of Judge and Mrs. James Gilfillan of Saint Paul. He attended public schools but was such a poor student he was sent to Shattuck Military Academy at Faribault. By the end of the year he was at the foot of his class, and instead of returning to Shattuck he obtained employment with Auerbach, Finch and Van Slyke, a jobbing house in Saint Paul, and later with the Northern Pacific Railway. After several years so employed, he went to Sauk Center where he spent two years with an uncle, Dr. James Montgomery McMasters, reading medicine and making calls with Dr. McMasters. Here it was that he became interested in the study of medicine. He matriculated at the University of Minnesota Medical School, graduating in 1897. He then took another year at the University of Pennsylvania Medical School, obtaining an M.D., degree from that institution in 1898. After interning at King's County Hospital in Brooklyn, he returned to practice in Saint Paul.

In 1906, Dr. Gilfillan married Hilda Benson. Having made himself proficient in German, he, accompanied by Mrs. Gilfillan, went to Vienna in 1907, to take postgraduate study in internal medicine. He characteristically refused to present letters of introduction to professors in Vienna but before the year was out had been put in charge of forty beds. His histories written in German script were so reliable that he was known as the Rock of Gibraltar. Upon his return to Saint Paul, he limited himself to internal medicine, having done some surgical practice before his trip to Vienna.

Although Dr. Gilfillan was anything but a student in his youth, he became an insatiable reader and fine student after he began the study of medicine. He became very proficient in German, French and Swedish—having learned the last of these languages from Mrs. Gilfillan. He was blessed with a remarkably retentive memory. His ability in the field of diagnosis was a source of envy of the many young doctors with whom he came in contact. His absolute honesty was universally recognized by his friends and acquaintances. No description of his character would be complete without mention of his keen sense of humor.

Dr. Gilfillan was on the University of Minnesota Medical School faculty from 1903 until his retirement in 1936, having been Associate Clinical Professor of Medicine from 1915 until 1936.

He was elected to membership in the Minnesota Academy of Medicine in 1905 and read his thesis February 1, 1905, entitled "Intermittent Gastric Hypersecretion," which was published in the *Saint Paul Medical Journal* (7:244, 1905). He served as president in 1931 and chose the title of "Compulsory Sickness Insurance" for his address as retiring president on January 13, 1932. This address was published in MINNESOTA MEDICINE in 1932 (15:295, 1932).

Dr. Gilfillan was a member of the Miller Clinic during its existence from 1921 to 1933. He maintained offices with Dr. A. R. Hall and Dr. George E. Senkler from 1933 until his retirement from active practice in 1938. A fractured hip sustained April 16, 1949, doubtlessly contributed to his death on June 13, 1949, at the age of eighty. He is survived by his widow, a son James, three grandchildren and four sisters.

C. B. DRAKE

A motion was carried that this memorial be spread on the records of the Academy and a copy sent to the family.

The scientific program followed.

Dr. R. T. La Vake, Minneapolis, read a paper on "The Rationale of Blood Transfusion in the Toxemias." (See page 39.) Discussion by Dr. Albin Matson (by invitation) of Minneapolis.

Dr. John F. Briggs, of Saint Paul, then read his Inaugural Thesis on the subject "Pulmonary Mimicry in Bronchogenic Carcinoma."

THE PULMONARY MIMICRY IN BRONCHOGENIC CARCINOMA

JOHN FRANCIS BRIGGS, M.D.
Clinical Associate Professor of Medicine, University of Minnesota
Saint Paul, Minnesota

There has been a great increase in the incidence of bronchogenic carcinoma and there has been a great deal of controversy as to whether this increase is actual or apparent. The disease may occur at any age, but it is essentially a disease of men and is most frequent during the cancer decades. As far as can be determined, social level, economic level, season or climatic condition, and geographical location have nothing to do with the development of this particular disease. Ordinary occupations apparently have no effect upon the development of this condition but it appears more frequently in cobalt mine workers.

There is no pathognomonic sign of bronchogenic carcinoma. There is also no single symptom or physical

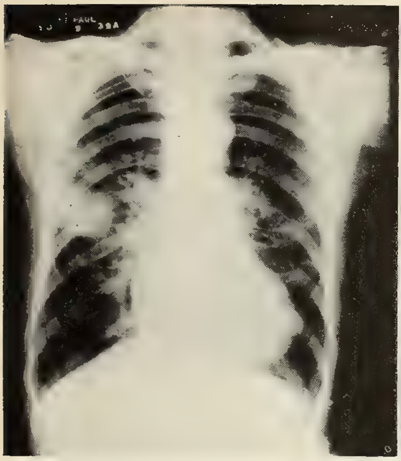

Fig. 1. Patient believed to be suffering from either pulmonary infarction or metastatic carcinoma. Ultimate diagnosis proved to be metastatic carcinoma.

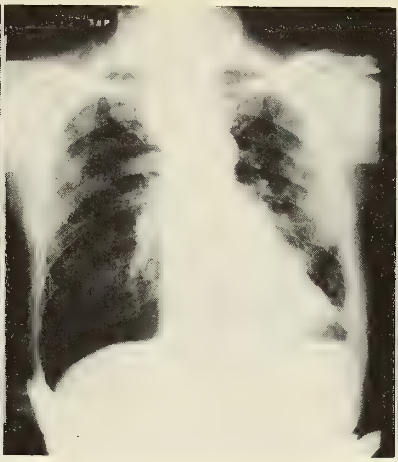

Fig. 2. Atelectasis at left base later proven to be the result of a bronchogenic carcinoma.

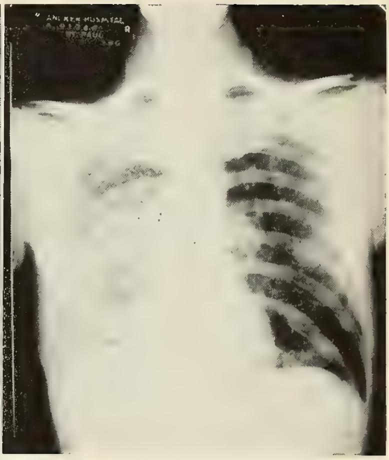

Fig. 3. Lung abscesses later proven to be bronchogenic carcinoma.

finding to suggest the disease. The inherent nature of the lesion is such that the disease can and will mimic any other type of intrathoracic disease. Ordinarily, the tumor begins within the bronchus, producing various degrees of obstruction to the bronchus. The signs and symptoms of the disease depend upon the extent of the obstruction and whether or not there is an associated infection. Bronchogenic carcinoma can mimic any other intrapulmonary condition. It is for this reason that the disease commonly becomes far advanced before it is recognized. Our duty as clinicians is to recognize the disease sufficiently early to permit surgical intervention.

The disease may occur in any part of the bronchus or in any portion of the lung. Occasionally, the tumor may arise out in the periphery of the lung. On microscopic examination, the tumors may be divided into squamous-cell carcinomas, adenocarcinomas, undifferentiated carcinomas, round-cell carcinomas and, occasionally, alveolar-cell carcinomas.

The chief means by which bronchogenic carcinoma can be diagnosed is through the routine taking of chest radiographs. Certain types of infiltration and shadows seen on the film will often lead one to suspect the presence of an underlying bronchogenic carcinoma. However, since this disease can mimic any other form of intrapulmonary lesion, it is also apparent that bronchogenic carcinoma may simulate the x-ray appearance of other types of intrathoracic disease. It is because of this power of mimicry that we must use all diagnostic aids possible to determine whether or not a given lesion is a primary lung malignancy. Occasionally, the malignancy may be associated with some other type of chronic pulmonary disease, such as tuberculosis. Since the disease has this power of imitation, it does present itself in a form suggesting other intrapulmonary disease. The diagnosis is usually made because of a high index of suspicion concerning its existence. It is well to remember that whenever a lung lesion fails to follow the course originally diagnosed, one should immediately suspect that it is a primary carcinoma.

Consultation with the roentgenologist will lead to the use of highly specialized types of x-ray technique such as bronchography, penetration films, and fluoroscopy. The roentgenologist has available many procedures that will aid him in establishing the diagnosis of a bronchogenic carcinoma. The ultimate diagnosis, however, depends upon the histological demonstration of a malignant lesion. This may be done through a biopsy of the tumor, a specimen having been obtained through bronchoscopic examination. Occasionally, tumor cells may be found in the sputum that the patient coughs up, or tumor cells may be found in the material aspirated through the bronchus. Pleural effusion, when present, may contain demonstrable malignant cells, but when these tests fail one may have to resort to open thoracotomy with inspection and biopsy of the pulmonary lesion. Once the diagnosis has been established, there is only one treatment, pneumonectomy.

Summary

It has been emphasized that bronchogenic carcinoma is increasing and that the disease is extremely difficult to diagnose. It has been pointed out that the inherent pathological nature of this condition makes it possible for this disease to simulate any other known intrathoracic disease. The signs and symptoms presented by the patient are the signs and symptoms common to all forms of chest diseases. There is no single pathognomonic sign or symptom or x-ray shadow of primary bronchogenic carcinoma. The x-ray may suggest the diagnosis, but the ultimate diagnosis must be made by biopsy investigation or open thoractomy investigation of the suspected lesion. In some instances, the diagnosis may be established by finding the tumor cells in the exudates or aspirates of the patient. Once the disease has been established as a bronchogenic carcinoma, there is no other treatment but surgical intervention.

Conclusion

Cases have been reviewed emphasizing the tremendous power of mimicry on the part of bronchogenic carcinoma. These cases also emphasize that one must constantly suspect that an individual with a chest condition may be harboring bronchogenic carcinoma, and that whenever the disease fails to follow the course ordinarily peculiar to the condition, then the clinician should suspect an underlying bronchogenic carcinoma and institute immediately those diagnostic procedures necessary to refine and resolve the diagnosis.

Discussion

Dr. S. Marx White, Minneapolis: I would like to ask Dr. Briggs what experience he has had with the Papanicolaou method as applied to the examination of sputum in cases of this type.

Dr. Briggs: Our experience has been too limited in the use of this method to answer this question.

Question: What is the difference in ratio between male and female?

Dr. Briggs: Sex ratio is about four to five males to one female.

Dr. Leo G. Rigler, University of Minnesota: Dr. Briggs, in his usual forthright, honest fashion, has given us an extraordinarily clear picture of the situation of carcinoma of the lung. This is about as lucid a presentation as I have ever heard in a short period of time. It might be interesting to observe that from a statistical standpoint in the Veterans Hospital in Minneapolis, where the patients are practically all male, carcinoma of the lung is seen almost twice as frequently as carcinoma of the stomach. I would disagree with Dr. Briggs on the question of whether there is a characteristic x-ray picture of carcinoma of the lung. There is such a characteristic picture, which, of course, as in most clinical procedures, is not pathognomonic but is about as good as one finds in tuberculosis, pneumonia or other conditions of that type. Actually, of course, we are more conservative in diagnosing carcinoma of the lung than we would be, let us say, in diagnosing pneumonia, since such a diagnosis means possibly an extirpation of the whole lung. For that reason, as Dr. Briggs has pointed out, one may wish to rely upon cytological study. Nevertheless, at some point a diagnosis must be made and a conclusion reached other than by the procedure of thoracotomy.

There is a situation in which the x-ray examination is extremely valuable in the diagnostic identification of carcinoma of the lung; for example, in the type of case in which the diagnosis of pneumonitis or unresolved pneumonia is made, a diagnosis which unfortunately frequently covers up an actual carcinoma of the lung. The demonstration of bronchial obstruction by bronchography may clarify the situation, since an obstruction of a bronchus of the second or third or fourth order is very unusual in an inflammatory process, but very common in carcinoma. In such cases, where the sputum studies are negative and the bronchoscope cannot reach the lesion, bronchography may give these final clues to establish the diagnosis.

The problem of differentiation, of course, is an extremely difficult one. This is particularly true of the peripheral lesions of the lung which we are seeing so much more frequently now than previously because of the many survey films. Fortunately, these are in a small minority of the cases of carcinoma.

The larger number arise in the root of the lung, and it is here where the x-ray examination could be of very great value. We have followed a large series of cases in which x-ray examination had been made at some time or other in the past. It is evident from this series that minimal evidences of disease in the lung may be present anywhere from six months to seven years prior to the onset of symptoms of carcinoma of the lung. Careful attention to small changes in the roentgenogram, particularly moderate enlargement of one root shadow, minor degrees of increased radiability in one lung or band-like shadows of atelectasis, might lead to a much earlier diagnosis than has heretofore been possible. These findings, I should emphasize, are those of pulmonary disease and are not necessarily indicative of carcinoma; but, once the suspicion of carcinoma is aroused as a result of a routine x-ray examination of the chest, further studies will usually lead to its identification. We shall simply have to give more attention to the minor changes which occur in the lung in the numerous routine films of the chest with which we are confronted. I am grateful to Dr. Briggs for his splendid paper.

Dr. F. F. Callahan, Saint Paul: I am very glad to hear this paper by Dr. Briggs and also Dr. Rigler's discussion. I think up to 40 years of age that the incidence of carcinoma is about 5 to 1 in males. Very often the diagnosis is made by the detection of metastatic lesions, sometimes in the brain, and sometimes in other parts of the body before the lung lesion is discovered. Recently, I have had two cases that appeared to be lymphoblastomata of the mediastinum; both turned out to be carcinoma of the lung. We were looking for Hodgkin's disease or some other type of lymphoblastoma in these two cases. One case turned out to be a very rapidly spreading carcinoma of the bronchus, and the diagnosis was made by microscopic section of an enlarged cervical lymph node. The second case was diagnosed at autopsy. I think, in making sections from lesions one finds in the bronchus that differentiation of cells is extremely important.

If carcinoma of the bronchus is to be treated surgically, the growth must be far enough from the corina, or bifurcation of the trachea, to allow good closure of the bronchial stump. For a number of years, the Mayo Clinic has been grading the cells of tumor tissue removed from the bronchus into types 1-2-3-4. I understand that surgical treatment of types 1 and 2 has been quite encouraging, and disappointing in types 3 and 4.

Dr. Thomas J. Kinsella, Minneapolis: I wish to congratulate Dr. Briggs, not only for bringing this subject to our attention, but for the most sensible way in which he has presented it. We shall never diagnose primary bronchiogenic carcinoma at an early stage unless we think about it constantly and look for it in every patient who presents a lung lesion. This tumor is probably the most treacherous of all those with which we must contend, for it may simulate pneumonia, tuberculosis, bronchiectasis, lung abscess, virus pneumonia or almost any other known lung lesion. The terms "virus pneumonia" and "unresolved pneumonia" are dangerous if used as final diagnoses. If they are accepted as diagnostic problems, then the use of such terms may be justifiable.

The figures quoted from the United States Veterans Bureau Facility at Fort Snelling on the relative predominance of bronchiogenic carcinoma over carcinoma of the stomach at that facility must not be taken at face value, for this hospital is an official chest surgery center and receives the complicated chest cases from several states, whereas, the gastrointestinal cases come only from local trritory. Consequently, an erroneous impression may be obtained, if total figures alone are

SEARLE RESEARCH IN THE SERVICE OF MEDICINE

(Continued from Page 84)

considered. I can distinctly remember that not more than four or five years ago at this same hospital where as Consultant in Chest Surgery reviewing many chest conditions, my diagnoses of primary bronchiogenic carcinoma were met with the statement that they just did not see carcinoma of the lung among their patients. The truth of the matter was that they saw these patients but did not recognize the condition as bronchiogenic carcinoma.

I feel that one should forget about doing routine sputum examinations for carcinoma cells in an attempt to discover primary bronchiogenic carcinoma, because the technique is too time-consuming and detailed to be used as a routine diagnostic procedure. Studies of bronchial secretions aspirated directly from localized areas of the lung are much more valuable but only if the examinations are made by trained personnel experienced in this work. There are pitfalls which may lead to an erroneous diagnosis. Careful bronchoscopy, particularly using the right angle and the foroblique telescopes through the bronchoscope, are valuable and may enable one to visualize many tumors of the upper lobe bronchi beyond the reach of the direct bronchoscope. Direct biopsy from a visible tumor is of much greater value than cell studies, but the latter are of extreme value where biopsy cannot be obtained. The bronchogram is very important, but it must be carefully done and properly interpreted or it loses much of its value. When confronted by an obscure lung lesion, one should exhaust all of the diagnostic means at hand including x-ray studies, bronchoscopy, bronchography, a study of aspirated secretions, as well as a number of studies for tubercle bacilli by smear technique in an attempt to establish a definite diagnosis. If a diagnosis cannot be reached by these studies and if primary bronchiogenic carcinoma is under serious consideration, one should not wait for negative culture reports for tubercle bacilli for these tests are too time-consuming. I feel rather that one should resort to exploratory thoracotomy with excision of the local lesion and immediate pathologic examination. Primary bronchiogenic carcinoma moves too rapidly to justify a long delay for special diagnostic studies. The big criticism in the use of mass x-ray surveys for the discovery of primary bronchiogenic carcinoma lies in the facts that, as ordinarily carried out, too much time is wasted in ruling out tuberculosis and such time is extremely valuable in the treatment of bronchiogenic carcinoma. I have yet to see a resectable, curable, primary bronchiogenic carcinoma from the recent Minneapolis survey. In nearly 80 per cent of the patients whom we see with primary bronchiogenic carcinoma, the disease is too far advanced to justify even an exploratory thoracotomy. While occasionally, one may derive considerable benefit from palliative resection in primary bronchiogenic carcinoma, taken by and large the amount of palliation obtained is not too great. This tumor is usually a rapidly growing type which metastasizes early and widely. Late results from treatment are somewhat similar to those of carcinoma of the stomach with considerably less than 10 per cent five-year survivals. Earlier diagnosis and earlier treatment may improve these figures.

So far as localized nodules in the lung are concerned, I believe that there is no accurate means of diagnosing these by x-ray or other studies except by local excision and immediate pathological examination. Prompt investigation of these isolated nodules may bring about recognition of a few cases of carcinoma in an early stage.

The meeting was adjourned.

A. E. Cardle, M.D., *Secretary*

HEMOCHROMATOSIS

(Continued from Page 56)

of portal circulation. The autopsy showed a very extensive anastamosis between the omentum and the peritoneum of the abdominal wall, extending from the crest of the ilium up to the diaphragm. The adhesions were very dense and firm over the liver. This shunting of the portal circulation possibly accounts for the man's fairly good health and ability to carry on from 1934 until his death.

HOSPITAL OCCUPANCY RATE LEVELING

(Continued from Page 75)

of supplies, which will mount due to absorption of increased labor costs; and food, which will continue at present high price levels due to the federal price supports which show no signs of impermanence.

He adds, further:

"The past decade has been a period of phenomenal advance in medical science which has greatly increased the scope of hospital care and necessitated additional facilities. The possibilities of nuclear medicine and new diagnostic services indicate that the frontiers of medicine's knowledge and effectiveness will further recede. The hospital, having already been established as the health center of its community, must provide the facilities and the technical assistance to make these advances available to the sick. Additional costs again will be involved if we are to fulfill our mission of benefiting mankind in the continual battle against the misfortunes of ill health."

He advised hospital administrators to practice every technique of good management to prevent the public from assuming a disproportionate share of these rising costs, warning that adverse public opinion could damage the entire voluntary hospital system.

THE WASHINGTON AMA MEETING

The House of Delegates of the AMA, at its meeting at Washington in December, voted to change the By-Laws by requiring yearly membership dues of not over $25.00. This year will be the first in the history of the Association that members will have ever paid any dues. The $25.00 paid last year was in the nature of a voluntary assessment to meet an emergency and was paid by 80 per cent of the membership. By December 1, 1949, it netted $2,250,000 of which $2,050,000 had been budgeted and approved for the National Education Campaign of the AMA. The emergency, though relieved, is not over. If the medical profession is going to prevent the adoption of compulsory tax-supported government medical care, educational activities will have to be continued. The use of the funds derived from dues will not be limited to the educational campaign, for the AMA has need for the wherewithal to support its everexpanding activities.

The 1950 AMA dues are payable now at the headquarters of the Minnesota State Medical Association, 496 Lowry Medical Arts Building, St. Paul 2. Members who pay county and state association dues will maintain their memberships in county and state organizations. The payment of the additional $25.00 is required for AMA membership and does not include subscription to *The Journal*. That requires an additional $12.00, making $37.00 in all. The rather anomalous situation exists whereby a physician may be a member of a component county and state association but not of the national association.

Announcement was made at the AMA convention of the retirement as of December 1, 1949, of Dr. Morris Fishbein as editor. Dr. Austin Smith, secretary of the Council of Pharmacy and Chemistry of the AMA for a number of years, became editor of *The Journal* as of December 1, 1949. Dr. Robert T. Stormant, medical director of the Federal Food and Drug Administration of the Federal Government since 1947, succeeds Dr. Smith as secretary. Dr. W. W. Bauer, director of the Bureau of Health Education of the AMA, becomes editor of *Hygeia*. Dr. Richard J. Plunkett, who has been on the editorial staff of *The Journal* since 1947, assumes the managing editorship of the nine scientific journals devoted to the specialties published by the American Medical Association.

CONGRESS ON OBSTETRICS AND GYNECOLOGY

The International and Fourth American Congress on Obstetrics and Gynecology will be held on May 14 to 19 at Hotel Statler in New York. Mornings will be devoted to general sessions, and afternoons to the program of the medical section of the Congress. Separate afternoon sessions are planned for nurses, public health persons, and hospital administrators. A special program on the economic aspects of obstetrics and gynecology will also be presented. Information as to registration, housing data and program details can be obtained by writing to Dr. Fred L. Adair, 161 East Erie Street, Chicago 11, Illinois.

INTERNATIONAL COLLEGE OF SURGEONS UNITED STATES CHAPTER

The following Minnesota surgeons were made Fellows and Associate Fellows in the United States Chapter, International College of Surgeons, at the fourteenth annual assembly of the group in Atlantic City, November 7 through 11, 1949: *Certified Fellows,* Dr. Harold G. Benjamin, Minneapolis, and Dr. John D. Brown Galloway, Minneapolis. *Associate,* Dr. Benjamin J. Palen, Minneapolis. *Advanced to Rank of Associate,* Dr. John A. Williams, Saint Paul.

In addition, the following were named Honorary Fellows in the International Chapters of the International College of Surgeons: Dr. Alfred W. Adson, Dr. Louis Arther Buie, Dr. Byrl Raymond Kirklin, Dr. Harold I. Lillie, Dr. J. Grafton Love, Dr. John Silas Lundy, and Dr. Gershom J. Thompson, all of Rochester.

AMERICAN ACADEMY OF GENERAL PRACTICE

The American Academy of General Practice will hold its assembly at St. Louis February 20 to 23. Twenty-two of the country's leading clinicians will deliver papers at the Kiel Auditorium during the session. Hotel reservations may be made by writing to the Hotel Reservation Bureau, A. A. G. P., 910 Locust Street, Room 304, St. Louis 1, Missouri.

CONTINUATION COURSE IN CANCER

A continuation course in cancer for physicians will be presented by the University of Minnesota February 16 to 18. The course is sponsored by the Minnesota State Medical Association, the Minnesota Division of the American Cancer Society, and the Cancer Control Division of the Minnesota Department of Health.

Dr. Henry K. Beecher, professor of anesthesiology at Harvard University Medical School, will be the visiting faculty member for the course and will also deliver the E. Starr Judd Lecture in Surgery on the evening of February 16.

BLUE EARTH VALLEY SOCIETY

Members of the Blue Earth Valley Medical Society, covering Faribault and Martin Counties, elected Dr. Lewis Hanson of Frost president of the organization at the annual meeting in Blue Earth on November 17. Dr. Hanson succeeds Dr. Robert Hunt of Fairmont in the post.

Other officers elected include Dr. R. O. Burmeister, Welcome, vice president; Dr. Hubert Boysen, Madelia,

secretary-treasurer; Dr. J. J. Heimark, Fairmont, delegate, and Dr. G. W. Drexler, Blue Earth, alternate delegate.

Principal speaker at the meeting was Dr. R. M. Shick, Rochester, who spoke on "The Practical Aspects of Anticoagulant Therapy."

GOODHUE COUNTY SOCIETY

Election of officers highlighted a meeting of the Goodhue County Medical Society in Red Wing on December 1. Named as president was Dr. W. R. Miller of Red Wing. Other officers elected were Dr. O. E. Larson, Zumbrota, vice president; Dr. G. F. Hartnagel, secretary-treasurer; Dr. R. F. Hedin, delegate, and Dr. G. M. B. Hawley, alternate delegate, all of Red Wing. Society members at the meeting discussed the mass chest x-ray survey to be conducted in Goodhue County.

RAMSEY COUNTY SOCIETY

Dr. F. G. Hedenstrom was named president-elect of the Ramsey County Medical Society at a meeting in Saint Paul on November 28. He will take office in 1951. Serving as president of the group during 1950 is Dr. Warner Ogden.

SOUTHWESTERN MINNESOTA MEDICAL ASSOCIATION

At the annual fall meeting of the Southwestern Minnesota Medical Association, held in Worthington, Dr. Gerrit Beckering of Edgerton was elected president. Dr. Peter J. Pankratz, Mountain Lake, was named vice president, and Dr. O. M. Heiberg, Worthington, secretary-treasurer.

Dr. Beckering and Dr. E. W. Arnold, Adrian, were elected delegates to the Minnesota State Medical Association, with Dr. C. L. Sherman, Luverne, and Dr. W. B. Wells, Jackson, as alternates.

WRIGHT COUNTY SOCIETY

At a meeting of the Wright County Medical Society in Buffalo late in November, Dr. V. T. Ryding of Howard Lake was elected president. Other officers elected at the meeting include Dr. W. E. Hall, Maple Lake, vice president, and Dr. Theodore Catlin, Buffalo, secretary.

As tuberculosis, in some aspect, is the concern of every practitioner in whatever specialty, so its teaching is the responsibility of the entire medical faculty. The phthisiologist's concern is with the segment of the problem which lies within the field of internal medicine. As the thoracic surgeon is primarily a surgeon, so the phthisiologist is primarily an internist. The more he can participate with other internists in joint clinical research and teachng enterprises the better will be the education of the students who are under their mutual guidance. CARL MUSCHENHEIM, M.D., *Am. Rev. Tuberc.*, July, 1949.

Plan Now to Attend the

Sixth Annual Clinical Conference
Chicago Medical Society

February 28, March 1, 2, and 3, 1950

Palmer House **Chicago 3, Illinois**

A four-day meeting planned to keep you abreast of the latest developments in scientific medicine.

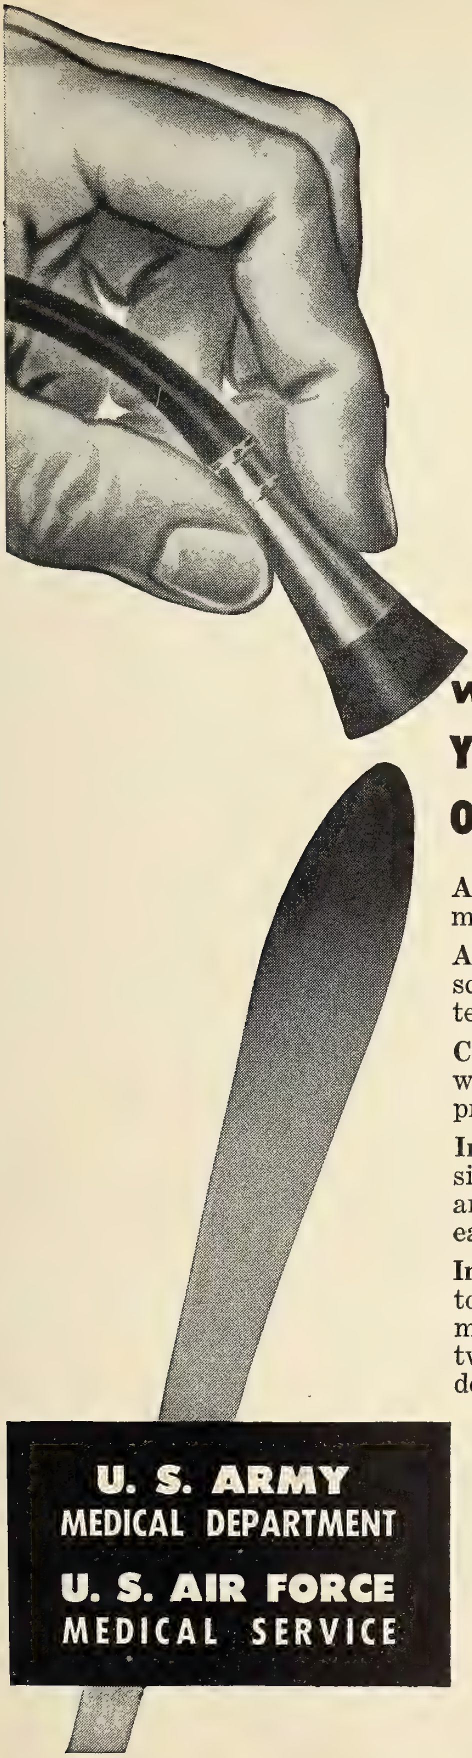
A group of outstanding men will present an excellent scientific program.

COLOR TELEVISION will be beamed from one of Chicago's large hospitals direct to the Palmer House.

Many instructive scientific and technical exhibits.

Make Your Reservations Direct with the Palmer House

1850—The 100th Anniversary of the Chicago Medical Society—1950



worth consideration . . .

YOUR FUTURE WITH THE ARMY OR THE AIR FORCE MEDICAL CORPS

Advanced medical and surgical practice with latest and most modern equipment and techniques.

Applied or pure research in many areas of medical science. Facilities of military and civilian medical centers—use of civilian consultant program.

Charted advancement in your selected career field with less administrative burden, more opportunity to practice.

Important personal rewards through extra professional pay on top of base pay, food and quarters allowances, other extras. Free retirement at comparatively early age.

Increased professional standing through contribution to a progressive, highly-specialized field of modern medicine. The military doctor-and-officer enjoys a two-fold responsibility and authority . . . contributes doubly to national welfare!

U. S. ARMY
MEDICAL DEPARTMENT

U. S. AIR FORCE
MEDICAL SERVICE

Your skills are vitally important to the national security effort. Write the Surgeon General, U. S. Army, or the Surgeon General, U. S. Air Force, Washington 25, D. C., for full details about Reserve Commissions and active duty!

✦ Woman's Auxiliary ✦

AUXILIARY LISTS BEST SEAL TALKS

Winners of the 1949 Christmas Seal high school radio project, sponsored by the Minnesota Public Health Association and the Woman's Auxiliary to the Minnesota State Medical Association, have been announced. They include:

High School Winners

First.—Shelly Budlong, Washington High School, Brainerd.

Second.—Janice Kinter, Greenway High School, Coleraine; Celestine Ahles, Cathedral High School, St. Cloud; Ruth Weber, St. Francis High School, Little Falls; Jeanne Fortier, Little Falls High School, Little Falls; Mary Jean Bohlinger, Mount St. Benedict Academy, Crookston; Robert Hanson, Rochester High School, Rochester; Joyce Lindell, Stillwater High School, Stillwater.

Junior High School Winners

First.—Barbara Sitzmann, Visitation Convent, St. Paul.

Second.—Anne Thompson, Laboratory School, Bemidji State Teachers College.

Honorable Mention

Senior Division.—Lorraine Hanson, Washington High School, Brainerd; John Marty, Meadowland High School, Meadowlands; Rosemary Mahoney, Good Counsel Academy, Mankato; Bill Hempel, Elbow Lake High School, Elbow Lake; Margaret Kramin, Danube High School, Elbow Lake; Elizabeth Gockowski, St. Agnes High School, St. Paul; Kathleen Lingle, White Bear High School, White Bear; Carol Arch, Central High School, Crookston; Roger L. Nelson, Rochester High School, Rochester; Donna Boelter, Blooming Prairie High School, Blooming Prairie.

Junior Division.—Eddie Roos, Central Junior High School, St. Cloud; Arlene Reed, Grand Rapids Junior High School, Grand Rapids; Barbara Bossus, Franklin Junior High School, Brainerd; Barbara Latterell, St. Francis High School, Little Falls; Marilyn Peterson, Central Junior High School, Rochester; Marlene Ebinger, Crosby High School, Crosby; Tom Uldrich, Little Falls Junior High School, Little Falls; Irene Tomhave, Washington Junior High School, Fergus Falls; Sally Clare, Stillwater Junior High School, Stillwater.

WORTHINGTON RADIO SERIES POPULAR

Mrs. O. M. Heiberg*

Now going into its third year, "Your Health Hour," a series of radio programs on health, has proved very popular with the KOWA, Worthington, listening audience.

The broadcasts, sponsored by the Woman's Auxiliary of the Southwestern Medical Society, are heard every Sunday afternoon at 2 p.m. Transcriptions supplied by the American Medical Association are used alternately with live broadcasts, presented by laymen and professional people from a six-county area.

During December, radio listeners who turned to Station KOWA learned about rheumatic fever, dodging contagious diseases, tuberculosis, good teeth for children, whooping cough.

The idea for the program developed from Health Days conducted in Pipestone and Nobles counties. Interest in the series is maintained by spot announcements calling the listeners' attention to the broadcasts. Doctors in the six counties receive a monthly card listing the topics to be covered in the broadcasts for that month. All newspapers in the six counties carry program announcements.

That the program creates general interest in health problems is indicated by requests for copies of scripts or for literature mentioned on the program.

MRS. BOIES ON NUTRITION COUNCIL

Mrs. H. E. Bakkila, president of the State Auxiliary, has appointed Mrs. L. R. Boies, Hopkins, to represent the Auxiliary on the Minnesota State Nutrition Council. The appointment was made in response to an invitation issued by Irene Netz, chairman of the organization.

Mrs. Boies is a member of the Hennepin County Auxiliary.

RANGE BRANCH ADDS NEW MEMBERS

Mrs. G. Erskine

The Range Branch of the St. Louis County Medical Auxiliary had a very successful membership tea, October 27, at the home of Mrs. L. W. Johnsrud, Hibbing. Many new members were enrolled.

* * *

Mrs. J. O. Meyer has left Grand Rapids for foreign fields. Dr. Meyer rejoined the army, with the rank of major, and they are now in Milwaukee, awaiting orders for Germany or Austria. They expect to sail some time in February. Mrs. Meyer was very active on the Grant Aid Committee and will be greatly missed.

* * *

Mrs. R. L. Bowen of Hibbing has had to curtail her activities this year due to a very serious operation.

* * *

On account of road conditions, the Range Branch will not meet again until March.

---

*Radio Chairman of the Woman's Auxiliary of the Southwestern Minnesota Medical Society.

TAKE THAT WINTER VACATION

Now!

FLY TO BEAUTIFUL

ACAPULCO AND MEXICO CITY

Special fun-filled excursion trips from the Twin Cities to sunny Acapulco and Mexico City aboard a luxurious 28-passenger multi-engined DC-3. Spend five, seven or ten glorious days bathing, sunning, sight-seeing or landing the big ones in the world's most famous deep sea fishing waters.

These are personally conducted tours but your time is your own. All reservations, including hotels, meals and side trips will be made for you if you desire. Total cost of round trip transportation per person is only $137.50 (plus $2.10 for Mexican tourist visa). Hotel accommodations in the finest hotels will cost approximately $8.00 per day including meals.

Call or write immediately for further information. Eight flights are scheduled for January, February and March but they are filling fast so get your reservation in early.

In Memoriam

JOSEPH OWEN McKEON

Dr. Joseph O. McKeon of Montgomery died suddenly in San Angelo, Texas, in November, 1949. He had been civilian medical officer at Goodfellow Army Air Base since June.

Dr. McKeon was born in Montgomery, Minnesota, February 23, 1892. He obtained his M.D. degree at the University of Minnesota in 1915 and interned at the Minneapolis General Hospital. He served in the Army from 1917 to 1919 with the commission of captain.

He was a member of Phi Rho Sigma medical fraternity and the Rice County Medical Society, the Minnesota State and American Medical Associations.

Surviving are his wife and three children, James and Mary of Minneapolis and Mrs. Robert Maxeiner, Jr., of Rochester, Minnesota, and his mother, Mrs. James McKeon, of Minneapolis.

THAYER C. DAVIS

Dr. Thayer C. Davis, a practicing physician at Wadena, Minnesota, since 1922, died November 18, 1949. He was sixty-two years of age.

Dr. Davis was born at Howard Lake, Minnesota, May 5, 1887. He received the degrees of M.B. and M.D. from the University of Minnesota Medical School in 1913 and interned at the City and County Hospital, Saint Paul. He was a member of the Alpha Omega Alpha society at the University.

He practiced at Warroad from 1914 to 1918 and at Glenwood from 1918 to 1922, before locating in Wadena.

Dr. Davis was president of the First National Bank of Wadena. He was a member of the Upper Mississippi Medical Society, the Minnesota State and American Medical Associations.

Surviving are his wife; two sons, Dr. Thayer Davis, Jr. of Beaver Dam, Wisconsin, and Robert of Sheyenne, North Dakota, and a brother, Dr. Thomas Davis, Wadena, with whom he was associated in the practice of medicine.

GEORGE R. DUNN

Dr. George R. Dunn, a prominent surgeon of Minneapolis, died on December 11, 1949, at the age of sixty-one.

Dr. Dunn was born at Princeton, Minnesota, December 24, 1887. He obtained a Ph.B. degree from Hamline

University in 1910 and his M.D. from Johns Hopkins Medical School in 1914. He interned at the Johns Hopkins Hospital for a year.

He was a fellow of the American College of Surgeons, Assistant Professor of Surgery at the University of Minnesota Medical School, and was on the staff of Northwestern Hospital in Minneapolis. He was a member of the Hennepin County Medical Society, the Minnesota State Medical Association, the American Medical Association, the Minnesota Neurological Society and the Minneapolis Surgical Society.

Surviving are his widow, a son and two daughters. His sister, Grace A. Dunn, is editor and publisher of the *Princeton Union* at Princeton, Minnesota.

LEONARD HARRIMAN

Dr. Leonard Harriman of Howard Lake, Minnesota, passed away November 25, 1949.

Dr. Harriman was born in Parishville, New York, on November 3, 1873. Later he moved to Wisconsin and at the age of twenty-four joined the Army and served in Puerto Rico during the Spanish-American war.

He received his M.D. degree at the University of Illinois medical school in 1909 and took two years of internship at St. Mary of Nazareth Hospital in Chicago,

He practiced at Lake Mills, Wisconsin, from 1911 to 1914, when he moved to Howard Lake, where he was local surgeon for the Great Northern Railway in addition to carrying on a general practice.

Dr. Harriman had been local health officer since 1918, president of the school board for many years, president of the Security State Bank, and was active in many community projects.

He was a member of the Wright County Medical Society and the Minnesota State and American Medical Associations.

Dr. Harriman is survived by his wife, the former Anna Bringman.

Health education is the application of measures to induce experiences which favorably influence knowledge, attitudes and actions for the prevention of disease and the perfection of health of the individual members of society. Ira V. Hiscock, *Pub. Health News,* Feb., 1949.

◆ Of General Interest ◆

All Minnesota physicians are invited to send to Minnesota Medicine items "of general interest" concerning themselves or their colleagues. To ensure accuracy and completeness, it is suggested that items submitted contain the answers to the age-old newspaper questions: who? what? where? when? and (in some cases) why? Only the facts are needed, since items can be edited or rewritten for consistency of style.

* * *

According to a communication from Dr. B. A. Waisbren and Dr. Jean S. Hueckel in *The Journal of the American Medical Association* of November 26, 1949, the administration of aluminum hydroxide gel with **aureomycin** in order to reduce epigastric distress results in a lowering of serum levels of aureomycin and is therefore contraindicated.

* * *

Dr. Manley F. Juergens, formerly of Thief River Falls, became associated in practice with Dr. J. W. Stuhr and Dr. J. E. Jensen in Stillwater on December 1.

The son of Dr. H. M. Juergens of Belle Plaine, Dr. Manley Juergens was graduated from the University of Minnesota Medical School in 1945. After interning at Minneapolis General Hospital, he entered military service and served in the Army Air Corps. Following his separation from the Army, he took postgraduate training at the University of Minnesota, then joined a clinic in Thief River Falls, where he practiced during the past year.

* * *

"The Psychiatric Aspects of Alcoholism" was the title of a talk given by **Dr. Gordon R. Kamman,** Saint Paul, at a meeting of the Polk County (Wisconsin) Medical Society at the Hazelden Foundation, Center City, on November 17. The Hazelden Foundation is a private institution, located near Center City, for the rehabilitation of male alcoholics after they have been discharged from medical care.

* * *

Dr. Robert Davis Mooney has opened an office at Highland Medical Center, 670 South Cleveland Avenue, Saint Paul, for the practice of internal medicine.

* * *

Minnesota has embarked upon an extensive five-year program of state-wide **professional postgraduate education.** Physicians, dentists, nurses and pharmacists are being invited to a series of district seminars devoted to heart disease, cancer and psychosomatic medicine.

Each seminar consists of eight consecutive weekly meetings, with two lecturers usually appearing for one hour each. There are six lectures on heart disease, six on cancer and four on mental health.

The first of the seven seminars scheduled for the 1949-1950 season was held at Bemidji, with an average attendance of twenty-five physicians and thirty nurses at each meeting. The second seminar, held in Fergus Falls, attracted an average of thirty-five physicians, fifty nurses and thirty dentists for each meeting. Interest in the seminars has been so favorable that several Minnesota communities have voluntarily requested that they be considered for future sites.

The programs are planned and organized by the Minnesota Department of Health with the assistance of the University of Minnesota Schools of Medicine, Dentistry, Nursing and Pharmacy, the Minnesota State Medical Association. the Minnesota Nurses Association and the Minnesota State Pharmaceutical Association.

* * *

Dr. David A. Sher, a pediatrician associated with the Lenont-Peterson Clinic in Virginia, recently received a five-year appointment to the newly created Housing and Rehabilitation Commission of the City of Virginia. At the organization meeting, Dr. Sher was elected chairman of the commission.

* * *

Dr. B. O. Mork, Jr., Worthington, who is now studying for an advanced degree in public health at the University of Minnesota, has been replaced as director of District 5 of the Minnesota Department of Health by Dr. Helen B. Wolff of Worthington. Dr. Wolff received her medical and public health training in California. Her husband is a businessman in Worthington.

* * *

Dr. W. W. Haesly, a former Winona resident, opened offices for the practice of medicine in Wykoff in the middle of November. A graduate of the Northwestern University Medical School in 1948, Dr. Haesly served his internship at St. Luke's Hospital in Chicago.

* * *

At a health clinic conducted in Red Wing on November 14, more than 125 members of the high school junior and senior classes received vaccinations and Schick tests. In charge of the clinic were **Dr. George M. B. Hawley** and **Dr. Richard B. Graves,** both of Red Wing.

* * *

Dr. Hanns C. Schwyzer has opened an office at 2069 Ford Parkway, Saint Paul, for the practice of general surgery. Dr. Schwyzer formerly was associated with Dr. Martin Nordland in Minneapolis.

* * *

The first issue of a **Mayo Clinic newspaper,** aimed to promote a more neighborly relationship between the clinic's medical and business staffs, was published on November 26. In an article on the aims of the new publication, the editor, Bill Holmes, a former newspaper reporter, stated that in the early days of the Mayo Clinic, when both business and

THE THIRD OF A SERIES

We are using the opportunity afforded by the advertising facilities of Minnesota Medicine to discuss Municipal securities for investment of your savings.

One type of municipal securities consists of obligations issued by municipalities to finance the construction of waterworks, light plants, sewer systems and natural gas distribution systems. They are payable from the net revenues received from charges and rentals from users. Their record for prompt payment is excellent. In some cases the taxing power of the municipality is also pledged.

We have had extensive experience in marketing revenue obligations of communities located in all sections of the United States. Our men have traveled widely through the territory and we have extensive reports and detailed information on all States where we buy securities. We believe this experience will be valuable to you.

When care is used to see that the source of supply of water, electricity or gas is adequate, the utility system properly constructed, the rates high enough to pay the debt but not too high to discourage using the utility and the number of customers and other sources of income are adequate, revenue obligations afford an excellent investment. People will pay their public utility bills since the municipality can discontinue service unless payments are prompt.

medical staffs were small, "inter-department contact was a simple, neighborly process." Due to the "tremendous growth of the organization," he continued, the "amiable open-an-adjoining-door relationship" disappeared. The newspaper, it was hoped, would help to restore that neighborly feeling.

Tabloid size, 12 by 17 inches, the first issue carried four pages of feature stories and reports about clinic personnel. It was distributed to more than 2,500 "subscribers." Plans called for monthly publication at first, switching later to a two-week publication schedule. In the meantime a contest to select a name for the paper was to be held.

Among those in attendance at the meeting of the United States Chapter of the International College of Surgeons in Atlantic City early in November was **Dr. T. A. Lowe**, South Saint Paul.

* * *

Dr. Charles A. Haberle, formerly of Thief River Falls, has joined the staff of the Arrowhead Clinic in Duluth. A graduate of the University of Minnesota Medical School, Dr. Haberle received his postgraduate training at the University Hospitals. For the past three years he has been associated with a clinic in Thief River Falls.

At the annual dinner meeting of the Minnesota Chapter of the **American Medical Technologists** in Minneapolis on December 3, the national society of the AMT announced the reappointment of Jack O. Kirkham for a third year as its state representative. Chester Neese, Fergus Falls, was elected president of the state chapter.

* * *

Dr. Frederick L. Schade, Worthington, was one of the Minnesota physicians who attended a meeting of the Central Association of Obstetricians and Gynecologists in Oklahoma City early in November.

* * *

It was announced in November that **Dr. Fred Behling** of Moorhead planned to establish residence in Oklee on December 1 and that he had accepted a proposal by the board of the Oklee Community Hospital Association to establish a practice in a medical clinic then being constructed in the city. A graduate of the University of Minnesota, Dr. Behling has been on the staff of a Denver general hospital for the past year.

* * *

On December 1, **Dr. Brand A. Leopard** closed his office in Albert Lea for an indefinite period of time. The reason announced for the closing was ill health.

* * *

Dr. Thomas H. Seldon, of the section on anesthesiology at the Mayo Clinic, was installed as president of the American Association of Blood Banks at a meeting of the organization in Seattle on November 5.

* * *

As principal speaker at a meeting of the Saint Paul Business and Professional Women's Association on November 10, **Dr. Harvey O. Beek,** Saint Paul, discussed psychosomatic medicine and emotional disorders.

* * *

The Duluth Chamber of Commerce opened its 1949-1950 **industrial safety school** series on December 7 with the first of four monthly sessions on industrial safety work. The opening session was devoted to medical problems, and most of the talks were given by members of the St. Louis County Medical Society.

Dr. Frederick J. Kottke, of the University of Minnesota Division of Physical Medicine, speaking at the general meeting, discussed "The Importance of Rehabilitation Therapy for the Injured Worker." Speakers at various section meetings of the safety school were Dr. G. J. Strewler, Dr. J. J. Coll, Dr. M. G. Fredericks, Dr. R. L. Nelson, Dr. John H. Peterson, Dr. D. V. Luth, and Dr. E. C. Strauss, all of Duluth, and Dr. P. B. Monroe, Cloquet.

* * *

Dr. Wayne C. Rydburg of Brooten was honored at a dinner at the Glenwood Community Hospital on November 29. After many years of practice in the area, he planned to leave the community at the end

of December to become company physician for the Flour City Ornamental Iron Works in Minneapolis.

A member of the Glenwood Hospital staff since the opening of the hospital in 1940, Dr. Rydburg served as acting chief-of-staff last year. He was secretary of his county medical society for three years and had been named president-elect. He was president of the Brooten school board and had served as mayor of Brooten for five years.

* * *

It was announced on December 1 that **Dr. Kenneth L. Nelson** of Clara City planned to move to Balaton on December 15 to open an office for the practice of medicine. The village of Balaton has been without a resident physician for several years.

* * *

Dr. Carl C. Chatterton was the principal speaker at a meeting of Section 1 of the Child Psychology Study Circle in Saint Paul on December 5. The title of his talk was "Off to a Good Start." Dr. Chatterton is chief-of-staff of the Gillette Hospital for Crippled Children and is an assistant professor of clinical orthopedic surgery at the University of Minnesota Hospitals.

* * *

At a meeting of the **Minneapolis Chapter, American Academy of General Practice,** in Minneapolis late in November, Dr. Willis L. Herbert was elected president to succeed Dr. Willis M. Duryea. Other officers include Dr. C. W. Del Plaine, who succeeds Dr. J. H. Higgins as vice president, and Dr. Alexander J. Ross, who succeeds Dr. James A. Blake as secretary-treasurer.

* * *

Three county medical societies held a joint meeting in New Ulm on November 17. The three groups were the Brown-Redwood-Watonwan County Medical Society, the Blue Earth County Medical Society, and the Nicollet-Le Sueur County Medical Society. Principal speaker at the combined meeting was **Dr. Ben Sommers,** Saint Paul, who discussed the treatment of heart diseases.

* * *

After thirteen years of practice at Albert Lea, **Dr. Robert R. Swanson** moved to Madison and became associated with the Madison Clinic on December 1. In his new position, Dr. Swanson is chief of the eye, ear, nose and throat department of the clinic, replacing Dr. Walter N. Lee, who recently moved to California.

After graduating from the University of Minnesota Medical School, Dr. Swanson spent three years specializing in eye, ear, nose and throat diseases at Western Reserve University Hospital in Cleveland. Following that period of training, he opened his offices in Albert Lea.

* * *

Dr. Edward B. Kinports, International Falls, and his family spent two weeks in November at a ranch near Tucson, Arizona. While in Tucson, Dr. Kinports took a special course at St. Mary's Hospital.

Members of the Winona County Public Health Association, meeting in Winona on November 10, heard **Dr. Karl H. Pfuetze,** superintendent of Mineral Springs Sanatorium, discuss the benefits of mass chest x-ray surveys and describe the procedures used in modern sanatorium treatment of tuberculosis.

* * *

A talk on allergy was given by **Dr. Albert V. Stoesser,** clinical professor of pediatrics at the University of Minnesota, at a meeting of the Chelsea Heights Child Psychology Study Circle on November 22.

* * *

Mrs. E. H. Hartung, the wife of Dr. Elmer H. Hartung of Claremont, died in a Rochester hospital on November 30 at the age of forty-two.

* * *

Seven Mayo Clinic physicians were honored as new emeritus staff members at the clinic's annual staff meeting in Rochester on November 21. The six men and one woman each received an honorary scroll and a gift from the clinic staff. The new emeritus members are Dr. Walter C. Alvarez, Dr. Harry H. Bowing, Dr. Arthur U. Desjardins, Dr. Della G. Drips, Dr. Bert E. Hempstead, Dr. Henry W. Meyerding and Dr. Robert D. Mussey.

Mr. A. J. Lobb, legal advisor and former associate secretary of the clinic board of governors, also became an emeritus member at the meeting.

In the election of officers for 1950, Dr. H. I. Lillie was named president of the Mayo Clinic staff. Dr. F. P. Moersch was elected vice president; Dr. E. N. Cook, secretary; Dr. C. W. Rucker, first counselor, and Dr. C. H. Watkins, second counselor.

Dr. James F. Weir, retiring staff president, presided at the meeting. In his talk he paid tribute to Dr. Charles and Dr. William Mayo on the tenth anniversary year of their deaths.

Open house was held on December 4 by **Dr. Ralph B. Johnson** in his new office building in Lanesboro. The new medical office is constructed of brick and tile and contains a waiting room, x-ray room, minor surgery room and two examining rooms.

* * *

Dr. Mellvin E. Lenander, St. Peter, was appointed on December 5 by Governor Luther Youngdahl to the State Board of Medical Examiners, to fill the unexpired term of Dr. Albert Fritsche, New Ulm, who had resigned.

* * *

Offices for the practice of medicine were opened late in November in Richfield (Minneapolis suburb) by **Dr. Marie A. Smith.** A graduate of the University of Illinois, Dr. Smith served her internship at DePaul Hospital, Norfolk, Virginia. She then practiced in maternal welfare and well-baby clinics in Chicago before beginning a residency at the University of Chicago's Lying-In Hospital. Later she served in residencies at Maternity Hospital and St. Mary's Hospital in Minneapolis, then practiced in clinics in Dwight, Illinois, and Milwaukee, Wisconsin.

* * *

On November 16, at the fourth weekly session of the medical postgraduate seminar held in Fergus Falls, **Dr. Robert A. Green** and **Dr. Robert Hebbel** were the principal speakers. Dr. Green, instructor in internal medicine at the University of Minnesota, spoke on "Heart Failure," and Dr. Hebbel, assistant professor of pathology at the University, discussed "Use of Biopsy in Cancer Diagnosis."

* * *

Dr. Peter H. Cremer was honored by being named Eminent Citizen of Hastings at an honor assembly held in Hastings on November 28, attended by Governor Luther Youngdahl and high ranking officials of the Minnesota Veterans of Foreign Wars, sponsors of the event. Said the main speaker of the evening in paying tribute to the physician: "Dr. Cremer is a person who put the health of the people above the practical phase of his profession." And he added, "He is more of a health keeper than a bookkeeper."

* * *

Dr. W. W. Brown, formerly of Minneapolis, has opened offices for the practice of medicine at Big Lake, which has been in need of a physician for several years.

* * *

A Duluth physician, **Dr. Anderson C. Hilding,** presented a paper at the fiftieth anniversary meeting

THE VOCATIONAL HOSPITAL
TRAINS PRACTICAL NURSES

Nine months Residence course, Registered Nurses and Dietitian as Teachers and Supervisors. Certificate from Miller Vocational High School. VOCATIONAL NURSES always in demand.

EXCELLENT CARE TO CONVALESCENT AND CHRONIC PATIENTS

Rates Reasonable. Patients under the care of their own physicians, who direct the treatment.

5511 Lyndale Ave. So. LO. 0773 Minneapolis, Minn.

HOMEWOOD HOSPITAL is one of the Northwest's outstanding hospitals for the treatment of Nervous Disorders—equipped with all the essentials for rendering high-grade service to patient and physician.

Operated in Connection with Glenwood Hills Hospitals

HOMEWOOD HOSPITAL
Corner Penn and Plymouth Avenues North
Minneapolis Minnesota

of the Chicago Otological Society in Chicago on December 5. His paper was entitled "Absorption of Air from Various Parts of the Respiratory Tract and Its Relationship to Postoperative Lung Complications."

* * *

Dr. Morris Fishbein, former editor of the J.A.M.A., has joined the staff of *Postgraduate Medicine,* a publication edited by Dr. Charles W. Mayo, Rochester, and published in Minneapolis. It was announced that as a contributing editor, Dr. Fishbein would have a free hand in writing editorials, a column on medicine abroad, and his well-known "Dr. Pepys' Diary."

* * *

At a meeting of the city council in Crookston on November 8, **Dr. Russell O. Sather** of the Northwestern Clinic was named city health officer, member of the city board of health, and water, milk and cream inspector. All three positions were formerly held by the late Dr. L. L. Brown. Dr. Sather was appointed to the offices by Dr. M. O. Oppegaard, mayor of Crookston.

On November 15, at a meeting in Bemidji of hospital administrators and staff members from the northwest part of the state, Dr. Sather was appointed a member of a three-man committee to study the shortage of nurses in northern and rural areas of Minnesota. Appointed with Dr. Sather were **Dr. J. A. Cosgriff,** Olivia, and **Dr. W. L. Burnap,** Fergus Falls. The committee will report to the governor's committee on nursing in Minnesota.

* * *

Problems in setting up rural health services were discussed by **Dr. A. B. Rosenfield,** director of District 6 of the Minnesota Department of Health, at a meeting of the Saint Paul Area Public Health Council on November 16.

* * *

Dr. Samuel E. Bigelow joined the staff of the Fergus Falls State Hospital on December 1. Dr. Bigelow went to Fergus Falls from Clinton, Iowa, where he had been associated with the Independence State Hospital for more than a year. Before that, he was on the staff of the Sante Fe Railroad Hospital at Fort Madsen, Colorado.

* * *

It was announced on November 9 that **Dr. J. A. Watkins** would soon become a member of the newly formed Cottonwood County Clinic in Windom. At the time of the announcement, Dr. Watkins was completing a residency in anesthesia at the University of Minnesota. He has taken postgraduate training at Wayne County Hospital in Michigan.

* * *

Dr. Charles W. Mayo and **Dr. Waltman Walters,** Rochester, have been appointed members of the national American Legion medical advisory board for 1950.

Open house was held at the newly constructed Edina Clinic on November 23. Occupants of the modern two-story structure include **Dr. C. V. Rockwell** and **Dr. R. G. Tinkham.**

* * *

In Duluth on November 11, **Dr. Mary McCoy** celebrated her nintieth birthday anniversary. Although she retired from practice in 1938, Dr. McCoy still maintains an active interest in medicine.

A graduate of the University of Michigan Medical School, Dr. McCoy began practice in Duluth in 1890, shortly after completing her internship at a Columbus, Ohio, hospital. The start of her medical career, she recalls, had a reverse twist: she promptly contracted typhoid fever and spent the first seven months of her practice as a patient.

Two of Dr. McCoy's sisters also became physicians. One, Dr. Theresa Abt, still practices in Chicago and was in Duluth to celebrate Dr. McCoy's birthday. The other sister is the late Dr. Helene K. Knauf of Jamestown, North Dakota.

* * *

Dr. Harold W. Hermann has become associated in the practice of pediatrics with Dr. A. E. Karlstrom in Minneapolis. Dr. Hermann formerly was in practice in Caledonia with Dr. J. J. Ahlfs.

* * *

A husband and wife, both physicians, began practice in Jordan on November 19. They are **Dr. and Mrs. Paul Strahler,** both graduates of the College of Medicine at Marquette University. They both served their internship at the Medical Center in Jersey City, N. J.

AT YOUR CONVENIENCE, DOCTOR . . .

you are cordially invited to visit our new and modern prescription pharmacy located on the street floor of the Foshay Tower, 100 South Ninth Street.

* * *

Dr. Albert Faulconer, Rochester, presented a paper entitled "Some Observations on Post-Anesthetic Encephalopathy" at the fourteenth annual assembly of the United States Chapter, International College of Surgeons, in Atlantic City on November 11.

* * *

Announcement was made on December 8 that **Dr. Francis W. Lynch** of Saint Paul had been elected vice president of the American Academy of Dermatology and Syphilology.

* * *

Among the Minnesota physicians who attended a **continuation course** in traumatic and pediatric surgery at the University of Minnesota November 10 through 12 were Dr. Robert Gruys, Windom; Dr. B. W. Bunker and Dr. Frank E. Mork, Anoka; Dr. A. H. Borgerson, Long Prairie; Dr. Clarence Jacobsen, Chisholm, and Dr. Franklin C. Anderson, Owatonna.

* * *

In Brainerd, **Dr. W. E. Fitzsimons** and **Dr. M. D. McGeary** have moved into new offices in the east end of the Benson Building. Their new quarters include a waiting room and six examining rooms, all air-conditioned and modern in design. Associated with them in the clinic is a dentist, Dr. J. E. Echternacht.

* * *

It was announced on December 1 that **Dr. Albert C. Martin** would begin medical practice in Luverne about February 1. At the time of the announcement Dr. Martin was located in Harvey, Illinois.

* * *

Dr. Frederic J. Kottke, associate professor of physical medicine at the University of Minnesota, spoke on "Goals of Rehabilitation" at a meeting of the Minneapolis and Hennepin County Community Chest and Council on December 14.

* * *

At the AMA mid-year clinical session in Washington, D. C., on December 6, **Dr. A. B. Baker** and **Dr. Joe R. Brown** described rehabilitation possibilities of persons suffering from various neurological disorders. The basis of their presentation was the work done at the Minneapolis Veterans Hospital. Dr. Baker is director of neurology at the University of Minnesota, and Dr. Brown, who is now at the Mayo Clinic, has been on the University and Minneapolis Veterans Hospitals staffs.

* * *

The city of St. Peter acquired a new physician in December when **Dr. Harold S. Orwoll** became a staff member of the St. Peter Clinic. A graduate of the University of Chicago Medical School in 1946, Dr. Orwoll served his internship at Chicago Memorial Hospital. He then practiced at the Brewster Clinic in Holdrege, Nebraska, before moving to St. Peter. In his new location he is associated in practice with Dr. E. G. Olmanson and Dr. Helge Sandelin.

Mantoux tests were administered to children in Jackson County schools during November and early December. The testing was done under the direction of **Dr. Helen B. Wolff,** medical director of District 5 of the Minnesota Department of Health.

* * *

Dr. Herman J. Moersch, Rochester, has been appointed a member of the executive committee of the Minnesota Public Health Association.

* * *

Dr. James M. Thomson has opened offices for the practice of medicine at the Edina Medical Center, 3939 West Fiftieth Street, Edina (Minneapolis suburb). Offices are maintained in the same building by Dr. Harry C. Jensen and Dr. Francis M. Walsh. Dr. Irvin H. Moore, who formerly was located in the building, has moved his offices to 5013 France Avenue.

* * *

At the annual meeting of the **Interurban Academy of Medicine** in Duluth on November 16, Dr. James Easton, Superior, was elected president to succeed Dr. W. J. Strobel, Duluth. Other officers named were Dr. A. J. Bianco, Duluth, vice president, and Dr. Milton Finn, Superior, secretary-treasurer.

The principal speaker at the meeting was Dr. John S. Hirschboeck, Milwaukee, who spoke on "Significance of the Blood in Medical Diagnosis."

* * *

Dr. Herbert Plass, Minneapolis, discussed voluntary health insurance at a meeting of the Minneapolis branch of the American Association of University Women on November 14. Dr. Plass is co-chairman of the Hennepin County Medical Society's speakers bureau. The meeting was the second of a series devoted to national health problems.

* * *

It was announced on December 2 by **Dr. Eugene L. Zorn** that his practice in Erskine would be taken over on a part-time basis by two Red Lake Falls physicians. Dr. Lester N. Dale and Dr. James H. Reinhardt of Red Lake Falls planned to provide Erskine with a physician's services on two full days and two half days each week.

* * *

The offices of **Dr. Willmar C. Rutherford** and **Dr. Robert L. Cushing** have been moved into a newly constructed building at 505-507 Washington Street in Brainerd.

* * *

Why don't more college-trained women reach the top of their profession? This was the question that four professional women, including **Dr. Ruth Boynton,** director of student health at the University of Minnesota, attempted to answer at a meeting of the Minneapolis branch of the American Association of University Women on December 5.

The four women—a physician, a dentist, a lawyer and an architect—agreed that the biggest problem a professional woman faces is the prejudice of other women. A woman, it was suggested, feels inferior to a man, and to boost her morale she believes that

other women can't be as capable as other men. Therefore she refuses to consult a professional woman.

* * *

Dr. John D. Camp, Rochester, presented a paper entitled "The Roentgenologic Significance of Intracranial Calcification" at a meeting of the Radiological Society of North America in Cleveland early in December. Other Rochester physicians attending the meeting included Dr. J. R. Hodgson, Dr. D. G. Pugh and Dr. Martin Van Herik.

* * *

The **University of Minnesota** now ranks second in enrollment of full-time students. According to a survey by Dr. Raymond Walters, the University of California leads the field with an enrollment of 43,426 students, the University of Minnesota is second with 24,684, and the University of Illinois is third with 22,854. There seems to be no unanimity of opinion as to which of all the universities in the country is the best.

* * *

Dr. Andy Hall of Mt. Vernon, Illinois, was chosen the General Practitioner of the Year by the House of Delegates at the Third Clinical Session of the AMA in Washington, D. C., in December. Dr. Hall, still active at the age of eighty-four, has been mayor of Mt. Vernon, head of the township board, chairman of his Republican county committee, Illinois director of public health, a company surgeon in the Spanish-American War and chief of surgery in a base hospital in World War I, secretary and president of his county medical society, president of the Southern Illinois Medical Society and a councilor to the Illinois State Medical Society.

* * *

The health magazine **Hygeia,** published by the AMA since 1923, will change its name to Today's Health beginning with the March, 1950, issue. The new name is more descriptive of the aims and contents of the magazine. Beginning with the January issue, the magazine will be edited by Dr. W. W. Bauer, with Dr. William Bolton as associate editor.

* * *

Dr. H. O. McPheeters and **Dr. C. V. Kusz,** both of Minneapolis, presented a discussion on "Varicose Veins and Thrombophlebitis" at a meeting of the Stearns-Benton County Medical Society in St. Cloud on December 15.

* * *

Dr. Irving C. Bernstein, who was on leave from the University of Colorado School of Medicine and was associated with the Oliver Clinic in Graceville for the last six months of 1949, has returned to his post in Colorado. He is in the department of psychiatry of the medical school, located in Denver.

* * *

At the annual meeting of the **Minnesota Obstetrical and Gynecological Society,** held in Saint Paul on December 2, Dr. James Swendson, Saint Paul, was elected president of the group. Other officers named were Dr. W. F. Mercil, Crookston, vice president, and Dr. John A. Haugen, Minneapolis, secretary-treasurer.

* * *

Dr. John Noble, who recently completed a residency in medicine at Augustana Hospital, Chicago, became associated with the Oliver Clinic in Graceville on January 1. Dr. Noble is a graduate of the University of Illinois College of Medicine.

* * *

HOSPITAL NEWS

At the annual meeting of the medical staff at **Abbott Hospital,** Minneapolis, in early December, Dr. O. J. Campbell was named staff president. Dr. Campbell, a clinical professor of surgery at the University of Minnesota, has been a member of the Abbott Hospital staff for twenty years.

Other officers elected include Dr. John Haugen, vice president, and Dr. Walter Hoffman, secretary.

* * *

A sale of articles made by patients at **Glen Lake Sanatorium,** held at the Dayton Company in Minneapolis in November, brought in $2,805.85 in proceeds. The sale was sponsored by the Woman's Auxiliary to the Hennepin County Medical Society, which reported that the proceeds were a substantial increase over the previous year's sale.

* * *

BLUE CROSS-BLUE SHIELD NEWS

Minnesotans received over $1,000 000 in Blue Shield medical-surgical benefits during the first eleven months of this year. In November alone, Blue Shield paid three and a half times as many claims as during the same month in 1948.

Minnesota Blue Shield paid 3,195 claims in November, 1949—an average of 106.5 claims a day. In November, 1948, Blue Shield paid 886 claims—an average of 29.5 claims a day. In medical-surgical benefits this amounted to $83,413.62 more in November, 1949, compared with the November, 1948, Blue Shield benefits.

To date this year, Blue Shield subscribers have received $1,026,814.53 in medical-surgical benefits. Last year, Blue Shield subscribers received $152,224 in medical-surgical benefits during the same eleven-month period.

Enrollment in Minnesota Blue Shield has increased to cover 244,419 persons as of October 31, 1949.

The number of Minnesota doctors participating in Blue Shield has also increased. Fourteen doctors joined Blue Shield in November, making the total Minnesota doctors participating in Blue Shield 2 568. There is a considerable number of newly licensed doctors, however, who have not sent in their enrollment cards. Blue Shield urges all doctors who haven't as yet sent in their cards to do so as soon as possible.

Soon after the first of the year, Minnesota Medical Service, Inc., will mail statements of Blue Shield earnings during 1949 to all doctors to whom Blue Shield has made payments in excess of the amounts listed below:

State of Minnesota return—payments in excess of $500 per year

Federal Income Tax return—payments in excess of $600 per year

Cost of hospital services has continued to increase, and a greater number of Blue Cross subscribers have used hospital care. The average length of stay in the hospital for Blue Cross patients has decreased, however.

From January through October this year, payments to hospitals for Blue Cross subscribers' care amounted to $6,931,257.16—an increase of $1,190,586.87 over the amount paid out during this same period in 1948.

A review of the national scene shows an enrollment of 12,554,012 persons in United States and Canada in seventy-three Blue Shield or other non-profit prepaid medical service plans, as of June 30, 1949.

More than 35,000,000 persons in the United States and Canada were enrolled in non-profit Blue Cross hospital care plans on September 30, 1949. Blue Cross has enrolled 22.11 per cent of the total population of the forty-seven States and the District of Columbia served by Blue Cross, and 22.99 per cent of the combined population in the seven Canadian provinces served by Blue Cross plans.

Eight Blue Cross plans now have an enrollment of more than 1,000,000 members. Minnesota's Blue Cross plan is nearing that enrollment figure with 963,111 persons in Minnesota enrolled as of October 31, 1949.

CLINICAL OPHTHALMOLOGY FOR GENERAL PRACTITIONERS AND STUDENTS. H. M. Traquair, M.D., F.R.C.S., Ed., Consulting Ophthalmic Surgeon, Royal Infirmary, Edinburgh; Ophthalmic Surgeon, Chalmers Hospital, Edinburgh; Oculist to the Edinburgh Municipal Hospitals; Late Lecturer on Diseases of the Eye, Edinburgh University. 264 pages. Illustrated. St. Louis: The C. V. Mosby Company, 1948. Price $9.00.

This book was written specifically for the use of general practitioners and students. It is short and comprehensive, covering the common office ophthalmological problems.

FRANK ADAIR, M.D.

STEDMAN'S MEDICAL DICTIONARY. Seventeenth revised edition. Edited by Norman Burke Taylor, M.D., University of Western Ontario. 1361 pages. Illus., including color plates. Price $8.50 with thumb index; $8.00 without thumb index. Baltimore: Williams and Wilkins Company, 1949.

The seventeenth edition of this well-known medical dictionary is a useful and attractively bound reference book. In the preparation of this revision, the publishers state, obsolete words were deleted and old definitions revised. Most of the trade names found in the last edition have been removed, and no new ones have been added. The inclusion of brief biographical sketches of the principal figures in the history of medicine constitutes a new feature of the dictionary.

The book is well illustrated with clear line drawings and several color plates. Though no more at fault than many other dictionaries, this volume would be improved if the definitions were set in slightly larger type.

J.H.L.

CONTROL OF PAIN IN CHILDBIRTH; ANESTHESIA, ANALGESIA, AMNESIA. By Clifford B. Lull, M.D., F.A.C.S., F.I.C.S., Director, Division of Obstetrics and Gynecology, Philadelphia Lying-in Unit, Pennsylvania Hospital, and Robert A. Hingson, M.D., F.I.C.S., F.A.C.A., F.I.C.A., Associate Professor of Obstetrics; Anesthesiologist, Department of Obstetrics, Johns Hopkins University and Hospital; Surgeon, United Public Health Service; with an introduction by Norris Vaux, M.D. 3rd ed. rev. and enlarged. 522 pages Illus. Philadelphia: J. B. Lippincott Company, 1948. Price $12.00.

In reading the first edition of Lull and Hingson's "Control of Pain in Childbirth," one immediately gets the impression that the book was written as an epitome on the use of intermittent caudal anesthesia. This is understandable in view of the introduction and popularization of this method of relief of pain in labor and delivery by the authors.

The third edition brings the reader up to date on caudal anesthesia, results and techniques, with additional material, such as modifications in caudal techniques in very obese women and a section entitled "A Further Evaluation of Caudal Anesthesia" in reviewing the literature from the time of the first edition to the present. The paragraph on the use of continuous caudal anesthesia in the hypertensive toxemias has been expanded. The recent work done by Whitacre on the electro-encephalographic changes showing reversion toward a more normal brain wave pattern after relief of vasospasm by regional nerve block is quoted as support for the use of the intermittent caudal technique in eclampsia.

An entirely new section on the place of intravenous anesthesia by Louis M. Hellman of Johns Hopkins is a worth-while addition to the book. Another valuable addition is the fairly extensive description of the techniques and results of saddle-block anesthesia as used by Parmley and Adriani and in Dieckmann's Clinic. In the same vein is a new chapter on continuous spinal anesthesia and its use in obstetrics.

The book concludes with another new chapter, "The Early Care of the Newborn Infant."

This present edition, as its predecessor, is the best work available on intermittent caudal anesthesia in obstetrics and the apparent over-emphasis of this phase of relief of pain in childbirth in no way detracts from the value of the book, since other methods of pain relief are adequately discussed. The volume takes its place as one of the best in a difficult and everchanging field of medicine.

Albert F. Hayes, M.D.

INVITED AND CONQUERED. J. Arthur Myers, Ph.D., M.D., Minnesota Public Health Association. 737 pages, 356 illustrations. Webb Publishing Co., Saint Paul, Minn., 1949. Price $6.50.

This engrossing book, written in the author's customarily pleasing style, and dedicated to one of the most persistent yet unsung foes of the disease, is particularly timely this centennial year in documenting all the significant contributions and developments in tuberculosis in Minnesota during the past 100 years. Every incident and detail of anti-tuberculosis work, from the earliest pioneer days in 1659 through the most recent diagnostic technics of photofluorography and therapeutic procedures such as pneumonectomy are presented in chronological sequence. More than 1,900 persons who have played some role in the conquest are accorded their proper place. Pictorially, also, in addition to the photographs of 245 anti-tuberculosis workers, 120 illustrations and 14 graphs enhance the value of the book. It is a monumental and much-needed documentation of medical history, correlating activities within this state with the advances in tuberculosis throughout the world.

First is traced the initial infection of the Indians from the time of Radisson's first landing, in 1659, through the final stages of the New Ulm massacre in 1862. Then the story is told of immigration to Minnesota of people from all over the country and world, all of whom migrated here for the climatic cure of their tuberculosis. Koch's discovery of the tubercle bacillus only slowly was accepted as proof of contagiousness of the disease. It influenced greatly the diagnosis of tuberculosis as did also the introduction of the clinical thermometer in 1867, discovery of tuberculin in 1890, use of the x-ray after 1895 and the bronchoscope in 1898. Another chapter captivatingly tells of the early influx of doctors and the organization in 1853 of what is now the Minnesota State Medical Association, the creation and early history of the Minnesota Department of Health, the birth and foundling years of medical education culminating in the establishment of the University Medical School. Rounding out the first part are two chapters concerned with early mortality of human tuberculosis, and such early efforts to control the disease as reporting cases, quarantine and sanatoriums.

In Part II are reviewed both the lesser and epochal advances in tuberculosis, especially as related to Minnesota persons, organizations and institutions. Of consuming interest are three chapters discussing pioneers, former Minnesotans, and the state's debt to other people. No detail is too small, no incident too trivial, no worker too obscure to be unmentioned in the historical progress against tuberculosis.

Among the institutions and organizations whose development has conditioned and paralleled advances in tuberculosis have been the University Medical School, the Minnesota Board of Health, sanatoriums and others. Here is the full story of the growth of the University Medical School from one small structure and five non-teaching faculty members in 1893 to its present size, with 541 teaching faculty members this year. No less intriguing and important, as far as tuberculosis is concerned, is the story of veterinary medicine and the eradication of tuberculosis in cattle in Minnesota. Even more intimately identified with eradication of human tuberculosis is the State Board of Health. This, too, is a fascinating epic of progress from conflict with other agencies to development of a special Tuberculosis Control Division and eight branch offices throughout the state. How Minnesota's sanatorium situation developed from not a single bed for tuberculous patients in 1900 to 2,200 beds for tuberculous patients in the State Sanatorium and fourteen county institutions provides here engrossing reading for anyone.

Even with discord between official and lay anti-tuber-

culosis organizations rife early in this century, there ultimately emerged an effective Minnesota Public Health Association. Since 1924, when the present personnel took the reins, this association has energetically and unremittingly employed every method and device to control the disease. Most effective and helpful were the tuberculin testing, tuberculin distributing and finally, the mass mobile x-ray unit and tuberculin testing campaigns. Unique in Minnesota's contributions have been accreditation of counties and schools in reducing the incidence of tuberculin reactors.

No such volume is complete without an evaluation of accomplishments to date, and an entire chapter is devoted to this topic. Comparisons of the mortality of tuberculosis and the numbers of earlier and present tuberculin reactors in various groups, states and the United States are discussed and graphically presented. In fact, this whole chapter is a remarkable testimonial to the effectiveness of the work of the innumerable persons, groups, agencies, organizations and institutions mentioned in preceding pages. Also of indispensable value is the final chapter of mileposts in tuberculosis eradication. Here are listed in almost outline form all the major events from 1659 to date in the history of Minnesota's fight against tuberculosis.

This book is truly a masterpiece of research and a basic contribution to the historical and tuberculosis literature of the state, if not the nation. Certainly, no one interested in the history of either Minnesota or tuberculosis could afford to neglect this book.

Edwin J. Simons, M.D.

FISHBEIN HAS COLORFUL CAREER

Dr. Morris Fishbein was born in St. Louis on July 22, 1889. He has had a colorful career during his long tenure with the American Medical Association.

He worked his way through the University of Chicago and Rush Medical College, taking lecture notes in shorthand and selling them to classmates. By 1912, when he received his M.D. degree, he was writing editorials for *The Journal of the American Medical Association.* The following year he became assistant editor of *The Journal* and has been with the AMA ever since, becoming editor in 1924.

In addition to his editorial work with the American Medical Association, Dr. Fishbein has written twenty-two books, edited seven others, writes twelve to fifteen popular magazine articles a year, delivers six or eight lectures a month, conducts medical columns in two magazines, writes a daily syndicated health column for more than a score of newspapers, is medical editor of the Encyclopedia Britannica, and a member of one of the technical advisory committees for the Atomic Energy Commission.

Dr. Fishbein likes to recall his early days with the AMA. When he came to the AMA in 1912, it had eighty employes and *The Journal* had 45,000 subscribers Today, the AMA has 860 employes and *The Journal* has a circulation in excess of 136,000. *The Journal* has more circulation than all other weekly medical journals in the world combined. Its runner-up is the *British Medical Journal* with a circulation of 65,000.

Dr. Fishbein has been in great demand as a public speaker, making on an average of one speech every three days. He speaks with the speed of a machine gun at its deadliest high tempo. A Charlotte, North Carolina, editor once wrote: "Dr. Fishbein doesn't stop for periods between sentences. He flies through these customary stops with the speed of lightning and with the grace of an eagle in its unhindered soar."—*AMA News Release.*

STERILITY AWARD

The American Society for the Study of Sterility is offering an annual award of $1,000 known as the Ortho Award for an essay on the result of some clinical or laboratory research pertinent to the field of sterility. Competition is open to those who are in clinical practice as well as to individuals whose work is restricted to research in basic fields or full time teaching positions. The prize essay will appear on the program of the forthcoming meeting of the American Society for the Study of Sterility, which is to be held at the Sir Francis Drake Hotel in San Francisco on June 24 and 25, 1950.

Full particulars may be obtained from the secretary, Dr. Walter W. Williams, 20 Magnolia Terrace, Springfield, Massachusetts. Essays must be in his hands by April 1, 1950.

Flexible Formulas

with DEXTRI-MALTOSE

simple to prescribe...simple to prepare

Milk plus water plus Dextri-Maltose*—*simple to prescribe*—is the mixture most widely used in the flexible formula system of infant feeding. Dextri-Maltose has helped physicians to build this system, now recognized the world over.

Formulas with Dextri-Maltose are *simple to prepare.* Dextri-Maltose is easily measured, is readily soluble, and can be used in any method of formula preparation.

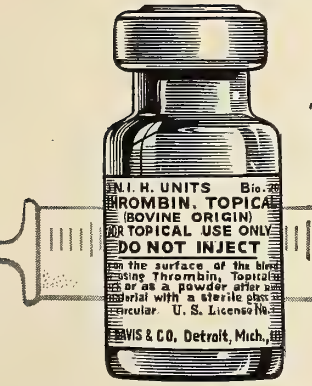
Local application of THROMBIN TOPICAL rapidly controls capillary bleeding. In three seconds a solution containing 1,000 units per cc. clots ten times its own volume of blood. It may also be applied as a dry powder.

THROMBIN TOPICAL

THROMBIN TOPICAL reacts with blood fibrinogen to form a firm adherent fibrin clot, end-result of the natural clotting mechanism. By this physiologic action THROMBIN TOPICAL helps control bleeding in all types of surgical procedures—lysis of abdominal or thoracic adhesions, mastectomy, transurethral prostatic resection, nose and throat operations, skin grafting, neurosurgery, orthopedic surgery, dental extractions, etc. Well tolerated by the tissues, it may also be used in conjunction with Oxycel® (oxidized cellulose, Parke-Davis).



THROMBIN TOPICAL (bovine origin) is supplied in vials containing 5000 N.I.H. units each, with a 5 cc. vial of sterile isotonic saline diluent. Also available in a package containing three vials of THROMBIN TOPICAL (1000 N.I.H. units each) and one 6 cc. vial of diluent.

Protection for the Living

Loss of earning capacity through illness or accident is economic death of the individual. It continues to entail suffering for those who are dependent upon him.

Protection is not complete so long as it does not include the great and growing hazard of economic death.

It's only logic that indicates that your best plan of income protection is through the plan tested by your Society.

Tomorrow may be too late. ACT NOW.

"The . . . estrogen preferred by us is 'Premarin,' a mixture of conjugated estrogens, the principal one of which is estrone sulfate."

Hamblen, E. C.: North Carolina M. J. 7:533 (Oct.) 1946.

In treating the menopausal syndrome with "Premarin," Perloff* reports that "Ninety-five and eight tenths per cent of patients treated with 3.75 mg. or less daily obtained complete relief of symptoms"; also, "General tonic effects were noteworthy and the greatest percentage of patients who expressed clear-cut preferences for any drug designated 'Premarin.'"

Thus, the sense of "well-being" usually imparted represents a "plus" in "Premarin" therapy which not only gratifies the patient but is conducive to a highly satisfactory patient-doctor relationship.

Four potencies of "Premarin" permit flexibility of dosage: 2.5 mg., 1.25 mg., 0.625 mg. and 0.3 mg. tablets; also in liquid form, 0.625 mg. in each 4 cc. (1 teaspoonful).

ACCEPTED COUNCIL ON PHARMACY AND CHEMISTRY AMERICAN MEDICAL ASSOCIATION

*Perloff, W. H.: Am. J. Obst. & Gynec. 58:684 (Oct.) 1949.

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens...estradiol, equilin, equilenin, hippulin...are probably also present in varying amounts as water-soluble conjugates.

"PREMARIN"®

Estrogenic Substances (water-soluble) also known as Conjugated Estrogens (equine)

Announcing new CUSTOM-BUILT

the 500 MA vertical control

AGAIN, Keleket sets the pace with a money-saving development. NOW—ALL UNITS—200 MA, 300 MA and 500 MA use the SAME TRANSFORMER and CONTROL which can be produced at a savings... passed on to you!

By standardizing many parts of the world-famous Multicrons, Keleket is able to offer custom-built units... which fit your individual requirements exactly . . . at most attractive prices.

Every unit is equipped with the same functionally designed cabinet, finished in handsome Kelekote.

This unit may be installed permanently, even in a wall, with no worry about alterations . . . should your future technic requirements call for the higher capacity Multicrons.

All units . . . 200 MA, 300 MA and 500 MA... include the features which have made Keleket Multicron Controls so popular with radiologists . . . for flexibility, convenience and accuracy.

the 200 MA vertical control

The controls are rated as follows:

DIAGNOSTIC

200 MA unit—125KVP at any MA from 25 to 200
300 MA unit—125 KVP at any MA from 25 to 300
500 MA unit—125 KVP at any MA from 25 to 500

THERAPY

All units—140 KVP to 10 MA

An optional Photo-Timer and Photo-Timing pushbutton control can be mounted in the vertical controls. Unit is so designed and engineered that only minor alterations are required to effect increased capacity and timer changes.

Telephone or write for complete details

CAMP ANATOMICAL SUPPORTS for ORTHOPEDIC CONDITIONS

Whether it be relief from lesser degrees of postural or occupational strain, or as an aid in treatment following injury or operation, the Camp group of scientifically designed orthopedic supports for men, women and children will be found "comprehensive." Sacro-iliac, Lumbosacral and Dorso-lumbar supports may be prescribed for all types of build. The Camp system of construction fits the support accurately and firmly about the major part of the bony pelvis as a base for support. The unique system of adjustment permits the maximum in comfort. Physicians may rely on the Camp-trained fitter for the precise execution of all instructions.

If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent on request.

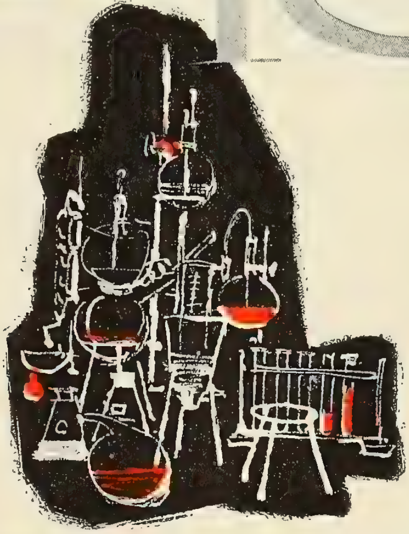
AUREOMYCIN HYDROCHLORIDE LEDERLE

in resistant staphylococcal infections

AUREO-
MYCIN

Aureomycin has been shown to be highly useful in the control of staphylococcal infections, many of which exhibit a high degree of resistance to other antibiotics and chemotherapeutic agents. The prognosis in systemic staphylococcal infections is sufficiently serious so that the optimum treatment should be administered immediately, and continued for one or several days after the temperature has subsided to normal.



Aureomycin has been found effective for the control of the following infections: bacteroides septicemia, brucellosis, Gram-negative infections — including those caused by the coli-aerogenes group, Gram-positive infections — including those caused by streptococci and pneumococci, granuloma inguinale, lymphogranuloma venereum, *Hemophilus influenzae* infections, primary atypical pneumonia, psittacosis, Q fever, rickettsialpox, Rocky Mountain spotted fever, penicillin-resistant subacute bacterial endocarditis, sinusitis caused by susceptible organisms, tularemia, typhus, bacterial and viral-like infections of the eye.

Capsules: Bottles of 25, 50 mg. each capsule. Bottles of 16, 250 mg. each capsule.
Ophthalmic: Vials of 25 mg. with dropper; solution prepared by adding 5 cc. of distilled water.

Even a flood...

failed to stop GE Service!

It was spring in Marietta and the Ohio River was on its seasonal rampage. In fact, its swollen waters were even licking at doorsteps in the busy downtown section — eagerly reaching higher and higher.

Is it any wonder, then, that one of the town's leading x-ray technicians should be alarmed for the safety of her charge — vital, valuable x-ray equipment in the flood-threatened office of her employer, a well-known Marietta doctor. Quite naturally she telephoned GE's Columbus, Ohio office — told of her plight.

GE Service went into immediate aciton. Checked State Highway Department — found roads to Marietta water-blocked. Then, chartered a plane which landed across the river from Marietta at Williamsburg, W. Va., about an hour later. After reaching downtown Marietta by flatboat and walking a few blocks, the GE serviceman arrived across the street from the doctor's office. However, flood waters blocked the way. This problem was neatly solved when a stalwart dentist friend happened along and volunteered to carry him and his equipment across the street piggy back.

The x-ray equipment was speedily dismantled, loaded on a high wheeled truck and taken to the doctor's home which was located on higher ground.

This story is typical of the hundreds of documented GE Service reports in our files. A service which proudly lends a new, broader conception to the guarantee that stands back of every GE installation.

Don't wait for a flood to call for GE Service... its available always at —

"good things come in small packages"

ESTINYL

(ethinyl estradiol)

The desired estrogenic effects can be expected from small dosage with ESTINYL,® Schering's ethinyl estradiol, the most potent oral estrogen available for clinical use today. The dose is small; 0.05 mg. or less per day usually controls menopausal symptoms.

Specificity is reflected in speedy relief, often within as few as three days;[1] in marked improvement in general well-being;[2] in the virtual "absence of side reactions if minimal effective doses are administered"[3]; and in economy—less than five cents per day.

ESTINYL Tablets are available in 0.05 and 0.02 mg. strengths. Bottles of 100, 250 and 1000 tablets. Also available in 0.5 mg. strength. Bottles of 30 and 100 tablets. ESTINYL Liquid containing 0.03 mg. per 4 cc. Bottles of 4 and 16 oz.

Good Nutrition..

A VITAL FACTOR IN THERAPY

The sound and wholesome nutritious diet is an integral part of modern day preventive and definitive therapy. A steady stream of adequate amounts of all the essential nutritional elements is vital for good growth, maintenance of tissue structure and functioning, healing after trauma, and resistance to infection. For maintaining this daily, steady stream of nutrients, however, conditions both in health and illness often make imperative the use of an efficient food supplement along with the diet.

The *multiple dietary food supplement* Ovaltine in milk has wide usefulness for enhancing to full adequacy even nutritionally poor diets. Its rich store of vitamins and minerals includes vitamins A and D, ascorbic acid, thiamine, riboflavin and niacin, and calcium, iron and phosphorus. Its nutritionally complete protein has excellent biologic rating

Since these vital nutritional values along with carbohydrate and easily emulsifiable milk fat are incorporated in liquid suspension or solution, Ovaltine in milk is also especially adapted to liquid diets. The highly satisfying flavor makes for its ready acceptability when foods are often distasteful.

The important overall nutrient contribution of three glassfuls of Ovaltine mixed with milk is presented in the accompanying table.

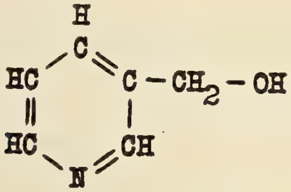
THE VASODILATOR—RONIACOL

Report on a Preliminary Clinical Study

S. MARX WHITE, M.D., F.A.C.P.
Minneapolis, Minnesota

RONIACOL,* a vasodilator substance which is converted in the organism to nicotinic acid, is 3-pyridine-methanol or B-pyridyl-carbinol (the alcohol corresponding to nicotinic acid) and has the following structural formula:



During the experimental period the code designation for the compound was NU2121.

Roniacol is a nonvolatile solid with a slight characteristic odor and is freely soluble in water and in alcohol. Aqueous solutions are practically neutral and may be used intravenously and intramuscularly if given with care.

For mice the LD_{50} (that dose which kills 50 per cent of the animals) is 1.4 gm./kg. intravenously, 2.0 gm./kg. subcutaneously and 3.0 gm./kg. orally. No untoward symptoms were observed in dogs from oral administration of 180 mg./kg. Diets containing twelve to twenty-four times the clinical dosage used in our study in man were fed to rats for three months without causing ill effects on blood formation, and produced no significant effect on growth rate compared with untreated animals. The daily administration to dogs of 250 to 500 mg. (the approximate amount given daily to man) for three months had no adverse effect on weight, blood formation, blood glucose or nonprotein nitrogen. The effects on the circulation in animals will not be considered here except to state that, in general, Roniacol has a powerful vasodilator effect on both coronary and peripheral circulation.

Clinical Considerations

There are several conditions in which somewhat prolonged vasodilation should be of benefit, particularly in treatment but also in diagnosis. These include conditions in which cerebral, coronary, renal, or peripheral vascular spasms are involved, such as Raynaud's disease, endarteritis, Buerger's disease, the syndrome of intermittent claudication, varicose ulcers of the legs, decubital ulcers, acrocyanosis, chilblains, the angina pectoris syndrome, migraine associated with vascular spasms, Ménière's syndrome, and ophthalmic conditions associated with deficient blood supply. Collateral circulation is of paramount importance when the vascular lumen is narrowed. Spasm of any measurable anastomoses further diminishes the nutrient supply beyond the point of arterial narrowing. On the contrary, dilatation may more or less compensate for the nutrient lack. To be effective in aiding nutrition in an area with deficient vascular supply, brief and evanescent dilatation in collateral vessels requires frequent repetition of the dilator effect. A prolonged dilator effect is to be sought and should aid in establishing permanent dilatation of the vessels involved.

---

*Roniacol is a vasodilator substance converted in the organism to nicotinic acid. The drug was kindly supplied by the manufacturer, Hoffmann La Roche, Inc., Roche Park, Nutley, New Jersey, for clinical trial. The statements as to chemistry, pharmacology and effect on circulation in animals are those of the manufacturer.

Evidence supports the view that when vasospasm occurs frequently, and especially when prolonged, the tendency is for constriction to occur more and more readily and to inhibit the development of permanent dilatation.

Also, when collateral circulation is evoked, dilatation which commonly occurs in the collateral vessels, if given sufficient time, may become permanent. The degree to which this develops varies greatly in different organs, states, vascular disorders and particularly in different individuals. More time and further study is needed to determine how much acute change and how much prolonged and permanent change can be produced by medication, and by surgical means such as sympathectomy in sites where this procedure is practicable.

While the rate of development of effective and permanent collateral circulation in arteries undoubtedly differs from that in veins, all available evidence reveals that it is slow and that the maximum dilatation is only gradually attained. There is at the present time no certain method of visualizing the coronary vessels in man during life, but analogy with situations in which either venous or arterial collateral circulation may be visualized should aid in understanding the processes involved.

Much experience has been gained in former years, before the use of anticoagulants became so widespread, in the rate of development of collateral circulation between the veins of the lower abdomen and the thigh in cases of obstruction in the iliac and femoral veins. Study of the veins seen at the surface between thigh and abdominal walls has shown that the full degree of dilatation of the anastomosing veins requires many months, in some instances a year or more.

Examples illustrating the time required for full development of peripheral arterial anastomoses are not so readily found, coarctation of the aorta perhaps furnishing as good an illustration as any, although the factor of body growth as well as other factors is involved. It is well known that the tortuous anastomotic arteries pulsating and palpable over the upper back, shoulders, and base of the neck, as well as the crenellation of the lower rib margins as seen by x-ray, take years to become evident.

The present preliminary report on Roniacol is concerned principally with two conditions in which vasospasm and vasodilation in a collateral circulation are important and often vital: acute transitory coronary insufficiency causing the angina pectoris syndrome, and peripheral vascular lesions including indolent and decubital ulcers in arteriosclerotic patients.

Roniacol is furnished in 50 mg. tablets, scored so that a half tablet may be used if desired. Given by mouth the amount has varied from 50 mg. in single doses or as often as four times daily, to 800 mg. daily in divided doses. The most common dosage was 100 mg. three or four times a day. A great advantage of the drug is the absence of irritation of the gastrointestinal tract and of adverse effect on the blood or blood-making organs.

The acute or immediate effect differs greatly with individuals and with the state of the stomach, whether empty or containing material that would dilute or delay absorption. The typical reaction when an effective dose, usually 100 mg., is taken on any empty stomach, begins in six to twelve to fifteen minutes, with a sensation on the face and forehead spreading to the ears, neck and upper chest (especially the ventral surface), often later on the hands and forearms, and occasionally in the feet and legs and even the torso, though usually in lesser degree. The sensation is variously described as "warmth," "prickling," "tingling," and occasionally as "burning," felt most strongly in the regions first involved. Following the paresthesia as a rule, but occasionally preceding or coincident, a visible flush appears, which in a few subjects becomes very deep. The pattern of the flush appearance is similar to that of the paresthesia though not identical in all cases. In a few individuals the flush involves the whole body, extremities and torso, and is usually mottled in patches palm-size or larger. The subjective and objective phenomena may last a half hour or longer, the subjective usually of shorter duration than the visible flush. Pulse rate, respiratory rate, and blood pressure are slightly and briefly affected. An increase of 10 mm. Hg in blood pressure has been observed once. The usual change is insignificant and is followed by a return to normal or only slightly below. In one instance of peripheral vascular disease involving the legs, pulsation was felt in a dorsalis pedis artery previously inert.

When the drug is taken with food, e.g., during a meal, the foregoing phenomena are usually lessened and in some are not manifest. In a few they have occurred in almost the full degree.

The drug has been used for patients with angina pectoris to determine whether tolerance to exercise, activity or excitement could be increased. In the angina pectoris syndrome the criterion of intolerance to these stresses is pain, characteristic in site and distribution for each individual.

From the postmortem appearance of diseased coronary vessels, change in the lumen of a narrowed coronary artery sufficient to produce clinically discernible benefit is improbable. Relief within five minutes or so of anginal pain which has caused the victim to cease activity must come through improvement of the collateral circulation by relaxation of spasm or through dilatation of the collaterals to permit nutrient blood flow to the area rendered deficient during the period of pain. In addition, time should allow a blood supply relatively inadequate only during the activity period to become adequate when the activity has ceased. Not having actually been seen in the anginal paroxysm in man, this sequence of events and the consequences can only be surmised, but the probable occurrence rests on sound clinical and pathological observations.

The quick relief by rapidly acting vasodilators strongly supports the belief that vasospasm is in part responsible for anginal pain. The action of the drug now under study is not sufficiently rapid to relieve established pain but has been used in an attempt to accomplish one or both of two objectives: (1) by a more or less prolonged vasodilator effect to increase the range of activity in which a patient may engage before pain develops, and (2) by such prolonged action to prevent or lessen vasospasm and encourage more permanent vasodilation of the collateral field.

Clinically, no brilliant, immediate or dramatic results are to be expected. The program of regime and drug therapy is a long one, requiring painstaking instruction on the part of the physician and continuous co-operation on the part of the patient. In the many years of dealing with the anginal syndrome this observer has seen from time to time patients in whom such a program conducted with care has been followed by gradually increasing tolerance of exercise. It should be emphasized that the one most important regulation should be to learn the amount or extent of exercise producing pain, to learn to stop short of this and to remain quiet the necessary moments before proceeding. Even the "aura" or any sensation known to precede the actual pain should be avoided. Glyceryl trinitrite is to be used only when the rule is forgotten, not with the idea that any damaging effect of the painful incident can be obviated or prevented.

The control of stimuli of an emotional character is less readily accomplished, but here also the physician has a responsibility, that of explanation and reassurance, and of advice concerning the control of the environment. Co-operation is not as readily secured as in the exercise field. I have not been impressed as a rule by the results when technical psychiatric help has been sought.

The routine use of tablets so widely touted by some of the drug houses today, combining a vasodilator drug with phenobarbital is a pernicious practice. It is a symbol of defeat in a situation requiring instead careful management with adaptation to individual need and regimentation most of all.

When improvement has occurred in the past, it has taken as a rule many months before a measurable increase in range could be noted. Not infrequently a year or more elapses before so great a change occurs that patient and physician both are confident that definite results are at hand. This slow progress of what is believed to be principally improvement in collateral circulation in the coronary vessels compares quite closely with the development of collateral circulation in surface vessels cited earlier.

The natural history of coronary disease with angina pectoris varies so widely in individuals that statistical analysis of results of treatment is not feasible. Fifty years of study of the disease by the writer should germinate impressions of value.

Lacking better agents, I have prescribed theocin, theobromine and theophyllin ethylene diamine preparations, and at times have believed one or another has been beneficial, but have always considered that persistent regulation of activity was of greatest importance in preventing vasospasm in the collaterals, thus allowing the vasodilator tendencies to gain the ascendency.

When it is remembered that while improvement in one area may be taking place, an atheromatous patch in another artery may be blocking a new channel in the coronary jungle, it is no wonder that in this field "art is long, the crisis is fleeting, experiment is risky and the decision difficult."

Patients in four groups have been studied: (1) the angina pectoris syndrome, (2) peripheral vascular disease, (3) indolent decubitus ulcers in arteriosclerotic patients, (4) Raynaud's disease.

The Angina Pectoris Syndrome.—Cases 1 to 9, inclusive. In Cases 1 to 6, studied over a period of six to twelve months, there has been noted an increase in range of activity without producing the pain syndrome which is greater to an appreciable degree than the author has been able to secure by other treatment. The increase in range and the greater freedom from pain episodes has begun earlier and has been remarkable in each of the six cases.

It is improbable that the point or points of atherosclerotic stenosis in coronary arteries responsible for the myocardial ischemia presumed to cause the pain have been affected. It is the author's opinion that a positive effective and prolonged vasodilatation is secured and that this contributes to an improved collateral circulation in the myocardial areas involved. It will take more time and observation on many more patients by many students of the problem before an adequate consensus of opinion develops. Other patients are under observation, and similar results seem to be developing, but the time is too short for appraisal. Report will be made in a subsequent contribution.

In three of the patients, Cases 7, 8, and 9, results were unsatisfactory and the drug was discontinued, but in these also no actual toxic effects were noted. Abdominal discomfort, extreme discomfort from the flushing and paresthesia, or lack of relief were responsible.

Peripheral Vascular Disease.—Cases 10, 11, and 12. In all three the improvement in peripheral circulation was evident early, and in the first two of these this demonstration has aided in the decision favoring sympathectomy. In Case 10 the hands were involved; in Case 11, the left foot. In Case 12 the improvement in circulation in the legs has been marked and, considering his age and mental state, has been considered satisfactory without sympathectomy.

Indolent Decubitus Ulcers in Arteriosclerotic Patients.—Cases 13 and 14. Two longstanding decubitus ulcers on the heels had failed to heal under vigorous management. Roniacol clearly aided peripheral circulation so that healing progressed satisfactory and the ulcerated areas closed.

Raynaud's Disease.—One case only, in a woman of fifty years (Case 15). There has been a definite and beneficial effect, but the case is too recent to admit conclusion as to the ultimate outcome. The result will encourage further trial in this field.

Conclusion

A new vasodilator substance, Roniacol, has been given clinical trial. In six cases of the angina pectoris syndrome, due to coronary sclerosis, the improvement in range of activity permitted before the typical pain developed has been greater than the writer has been able to secure by other medication in the past. This suggests that an effective degree of vasodilatation has been produced in the collateral vessels in the coronary circulation. In three cases the drug was discontinued because of abdominal discomfort, discomfort from the flushing and paresthesia, and failure of relief, respectively. In peripheral vascular disease and in indolent decubital ulcers in arteriosclerotic patients, improvement in the circulation was readily demonstrated, and in two cases in the first category laid the bases for sympathectomy. A patient with Raynaud's disease has, in a short time, shown much benefit. Results so far secured justify further extended trial of Roniacol in coronary disease with the angina pectoris syndrome and in all forms of peripheral vascular disease where an effective vasodilator with a somewhat prolonged action is called for.

Case Histories*

Case 1.—H. A. N., a business executive, aged sixty-three, was admitted to the hospital March 22, 1947.

The patient gives a history of malarial fever at twelve and in 1917 had a bout of fever which was called typhoid. If he walks 600 feet, he gets pain across the chest. This same type of pain was first noted eight years ago while fishing and compelled to row his boat against the wind with a storm coming up. That night he wakened with severe pain over the sternum which lasted about fifteen minutes. This occurred the next night and lasted only a few minutes. It was relieved by aspirin. Since then he has had an occasional pain on effort or walking, especially in the cold weather or after heavy meals or in walking six or seven blocks. This has occurred more frequently the past year and now almost every morning. It occasionally occurs at night for a brief period. There is no dyspnea. The pain goes into the upper arms, right and left, if severe.

The patient was seen again April 19, 1947, and he reported pain on walking three blocks and occasionally at night. The pain is relieved by nitroglycerin. Patient reported on May 17, 1947, that on the night of May 10 he had had pain twice lasting ten or fifteen minutes. He thinks he may have had too much to eat. Had much eructation of gas. Nitroglycerin gave relief.

---

*Case histories have been much abbreviated to permit publication.

Examination: Height 5 feet 8 inches, weight 158 pounds, pulse 75 per minute, blood pressure 152 systolic and 82 diastolic. The peripheral vessels showed arteriosclerosis 1+. A cholecystogram on March 29, 1947, showed the gall bladder filled and emptied normally, and concentrated well. On March 31, 1948, gastrointestinal barium motor studies showed the stomach filled and emptied well, no defects, duodenum partially posterior, normal, no tenderness. At six hours the meal was in the hepatic flexure. At twenty-four hours, during which a normal stool had occurred, there was no residue in the colon. Rectal examination of the prostate showed the prostate 1+, firm and regular. There were 15 c.c. of residual urine. Opinion was early prostatic hypertrophy The urine had a pH of 6.0, specific gravity of 1.020, no albumin, no sugar, no casts, no increase in leukocytes. The hemoglobin of the blood was 82 per cent, white blood count 8,200. The sedimentation rate of the red blood cells was 6 mm. in one hour. Wassermann reaction of the blood was negative. An electrocardiogram showed normal complexes with auricular and ventricular premature beats.

A diagnosis of coronary arteriosclerosis with angina pectoris syndrome was made. He was instructed to avoid activity which brought on pain and to use nitroglycerin 1/100 gr. under the tongue if pain developed, and was given theobromine sodium acetate 7½ grain enteric-coated tablets to be taken three times a day. Quinidine sulphate in 3 grain doses twice daily, given with morning and evening meal, controlled the extrasystoles. He did not experience satisfactory improvement of the anginal episodes. Patient was apparently unable to learn the necessity for stopping short of effort causing pain. His physical condition remained about as reported on March 22, 1947.

On November 20, 1948, he was given Roniacol and instructed to take one 100 mg. tablet before meals as a preventive of pain. On December 4, 1948, patient reported that on taking the drug on an empty stomach he has a feeling of flushing of the face, chest and ears lasting about five minutes. If the drug is taken with food this does not occur. He was more carefully instructed to try both methods, i.e., taking before and after meals, and report which method relieved this pain. He reported on December 4, 1948, that the first week after beginning the drug he had no pain but did the things he formerly did and without pain. However, after breakfast on one day after walking four or five blocks he had some discomfort but it was not pain as he had before.

On December 24, 1948, after continuing the Roniacol in 100 mg. doses three times daily, he reported if he takes it on an empty stomach he has about five minutes feeling of warmth of the face, forehead and ears. He feels that the incidence of pain is definitely lessened. The first week on Roniacol following November 20 was the best week he had had in four or five years. If he takes the remedy with the meals, he does not experience the warmth. On the morning of December 18 he took the remedy at 8:00 a.m., had breakfast five minutes later, feeling of flush continued, drove downtown without a suggestion of pain. He reports the impression that there has been a distinct increase in range without pain.

This man now sixty-three years of age continues his active business career. On frequent occasions he has mild anginal pain if he walks several blocks immediately after a meal, as breakfast or lunch, but in general is able to walk many blocks without pain, and this relative freedom has been accomplished in a much shorter time than has been the writer's experience in other cases.

Case 2.—P. T. B., a single male, aged sixty-four, an executive of a wholesale pharmacy house, was admitted to the hospital November 29, 1948. His father had died at the age of fifty-four of arteriosclerosis. His mother had died of pulmonary tuberculosis in 1938 at the age of seventy-nine. The patient lived in the same apartment. He used no alcohol nor tobacco. He had scarlet fever at the age of sixteen. In 1929 he had been told his blood pressure was 140/84, and first knowledge of its elevation was in February, 1943, when he was told it was 180 systolic, 110 diastolic.

He complained of precordial distress on walking two blocks, this the past few weeks and occurring after meals only. No dyspnea was noted. Distress ceases promptly on standing still.

Examination: Height 5 feet 4 inches, weight 153 pounds, temperature 98.6° F., blood pressure 154 systolic, 100 diastolic, heart rate 90, regular. Carotid sinus pressure right causes disappearance of heart tones for space of three or four beats. Heart tones faint, normal, no murmurs. General physical examination negative. Reflexes normal. Mantoux skin test positive. A six foot film of the chest shows heart well within normal limits as to size and contour. No parenchymatous lesions are present in the lungs. Films taken of the dorsal spine show no pathologic changes in spine. The urine is normal, hemoglobin 14.6 grams, red blood count 4,300,000, white blood count 7,600, with a normal differential count. The sedimentation rate of the red blood cells is 7 mm. in one hour. Blood cholesterol 188 mg. per cent. Electrocardiogram on December 1, 1948, shows PR interval .20 seconds, all T waves small, deep Q_3. Repeated April 6, 1949, essentially unchanged.

Diagnosis: Angina pectoris syndrome, probable coronary sclerosis. Instructed to avoid activity causing distress.

Treatment: Aminophyllin, enteric-coated tablets, t.i.d., p.c.; weight reduction.

December 23, 1948: Weight 146½ pounds, blood pressure 126 systolic, 82 diastolic. Reports that he can now walk three or four blocks without pain. Stooping over causes pain.

January 25, 1949: Weight 146½ pounds, blood pressure 135 systolic, 86 diastolic. Reports he can walk now five or six blocks without pain.

April 6, 1949: Has continued aminophyllin, 3 grains, enteric, t.i.d., p.c., but recently precordial pain develops on walking two blocks or less. Has continued work at desk every day. Blood pressure 102 systolic, 60 diastolic, heart rate 96 regular. Electrogram essentially unchanged from December, 1948. To take one 100 mg. tablet of Roniacol t.id. before meals.

He was observed weekly through April and May but very little change was noted. May 20, Roniacol was increased to 150 mg. t.i.d.

June 10, 1949: Reports that over-all picture is much improved. Can stoop over without causing pain. Feeling of oppression but no pain develops on walking three or four blocks but disappears in less than five minutes.

June 24, 1949: "I am much better than I was six months ago, can stoop without pain. Today walked seven blocks at a moderate gait wthout pain or having to stop; can now do calisthenic exercises which I could not do previously because of precordial distress. 150 mg. Roniacol with early part of meal usually causes flush at end of meal, lasting an hour and a half or longer."

July 22, 1949: Reports continued improvement to tolerance of exercise without pain. At 11:27 a.m. he was given 150 mg. Roniacol and the reaction observed. Within seven miutes he reported a slight burning sensation around "face and ear drums." Slight flush of face and chin was noted. In ten minutes a flush could be seen over the upper sternal region. In twenty minutes there was a burning sensation of the fingertips. In twenty-five minutes the flush had increased over the face, neck, chest to costal arch, shoulders to spines of scapulae, and over the hands. He complained of being slightly dizzy on getting off the examining table. During the period above, successive blood pressure readings of 132/85, 130/84, 128/82, 130/84 were recorded and the pulse rate remained between 72 and 75 per minute.

August 26, 1949: Weight 143 pounds. Directed to increase dosage to 200 mg. with meals and at hour of sleep, i.e., 800 mg. daily during period of anticipated vacation.

October 14, 1949: Can regularly walk four or five blocks even after meals without pain; often several more at a fair gait. Insists there is great improvement over condition and range of activity before beginning present régime.

Case 3.—H. E. G., a man, aged sixty-two, an industrial engineer, was admitted to the hospital July 1, 1944.

Present complaint: For the past two or three weeks he has wakened occasionally at 2:00 or 3:00 a.m. with a feeling of distress under the sternum. He is not aware that he had been dreaming. He notes also some dyspnea on any unusual exertion such as climbing a hill at golf.

Examination: Height 5 feet 6½ inches, weight 181 pounds, blood pressure 142 systolic, 88 diastolic, heart rate 72 regular, pulse of normal amplitude and character. A systolic murmur, 3+ loud and rough, was heard loudest over the aortic area and also to the right of the manubrium sterni and in both carotids, loudest in the left. The murmur could be traced downward to the left over the precordia and apex, fairly loud and rough, and was transmitted to the anterior axillary line. A six foot film of chest showed moderate ectasia and tortuosity of the aorta and a prominent aortic knob. The cardiac silhouette was suggestive of moderate left ventricular enlargement with a total cardiac diameter of 15.2 cm. in a chest diameter of 30.7 cm. There was no evidence of calcium deposit in the region of the aortic valve on fluoroscopic examination. Cholecystograms showed a fair concentration of the dye, normal limits in size and shape and position and good emptying after a fatty meal. There were distinctive shadows of at least four calculi measuring from 12 to 15 mm. in diameter. Barium gastrointestinal study showed no abnormalities throughout the tract, studied with special attention to esophagus and cardia. A gastric expression, free hydrochloric acid was 10, total 34 units. Blood showed hemoglobin 18.2 grams, erythyrocytes 5,500,000, white blood count 7,000 in normal percentages. Urine had a specific gravity of 1.022, trace albumin, 1 to 3 red blood cells per high power fields, no casts. Ophthalmoscopic examination revealed no vascular or other abnormalities. The blood Wassermann was negative. The prostate was normal. Electrocardiogram showed moderate left axis deviation. Blood cholesterol was 359 mgs. per cent.

Diagnosis: Cholelithiasis, aortic sclerosis.

With dietary regimen and bile salt administration, distress ceased and conditions remained stationary until the fall of 1948.

On September 20, 1948, he reported mild precordial pain or "distress" if he walks a block within an hour after a meal. Then if he stops and can belch gas, he is relieved. Later he can walk without the distress which he describes as a sense of pressure behind the sternum. The previous night he had a bout of severe epigastric pain lasting one-half hour, relieved by "bisodol followed by eructation of large quantities of gas" and this morning he has considerable discomfort in the epigastrium. Physical signs over the heart were essentially unchanged from 1944; weight 183 pounds, blood pressure 136 systolic, 80 diastolic, heart rate 66 regular. Electrocardiographic tracings as compared with tracings taken in 1944 showed flat T, and inverted T3 and T4 (chest electrode at apex).

A diagnosis of coronary sclerosis and angina pectoris syndrome is added. At his request, alphatocopherol 50 mg. t.i.d. was tried for a month without effect.

October 21, 1948: Conditions unchanged and again at his request daily dosage alphatocopherol was doubled to 300 mg. Reviewed by Dr. George B. Eusterman and Dr. H. L. Smith at the Mayo Clinic, the diagnoses given above were confirmed. They found the plasma cholesterol values 217 and 230 mg. per cent.

January 7, 1949: Alphatocopherol discontinued. Roniacol, a 100 mg. tablet t.i.d., was begun.

January 14, 1949: Reports the usual reaction if drug is taken on an empty stomach, i.e., flushing of face and head with sensation of warmth which comes on in ten to fifteen minutes and lasts twenty to thirty minutes. Has no pain or pressure sensation but has been more careful to avoid exercise causing pain. Directed to take 400 mg. daily.

March 14, 1949: After return from motor trip to West Coast. Flushing of face and sense of warmth after dosage as before. Has seldom had sense of pressure or pain on effort. His range is very definitely increased and the lessening and frequent absence of pain is especially noted.

June 7, 1949: Weight 176 pounds, blood pressure 155 systolic, 90 diastolic. Heart rate 48 regular. Has pain only if he walks after meals a full block rapidly. Can play golf without pain and dyspnea if he does not eat beforehand.

October 6, 1949: Weight 176 pounds. Blood pressure 148/82, heart rate 54 regular. Systolic murmur over aortic area, over precordium and at apex, transmitted to axilla as previously reported. Has had his usual dose of Roniacol with breakfast at 7:45, and was able to walk without pain or dyspnea. He was given a test dose of 100 mg. at 11:45 for observation. The usual paresthesia began in face, ears, scalp and neck in about seven minutes, and in ten minutes redness was visible and promptly became marked. Blood pressure 146/80, heart rate 48 regular. In eighteen to twenty minutes redness began over both hands and rapidly spread to forearms—no paresthesia here. Paresthesia lasted one-half hour, redness about forty minutes.

Directed to increase dose of Roniacol to 150 and 200 mg. q.i.d.—although he reports he can play golf without pain and has pain only when he walks rapidly after breakfast.

November 11, 1949: Marked improvement in range of activity without subsequent pain is noted. Can still bring on pain by walking rapidly immediately after a meal, but has learned to avoid this. Has played his usual game of golf without discomfort. Much better than before Roniacol was begun.

Case 4.—L. G. S., an automobile mechanic, aged forty-nine, was admitted to the hospital December 23, 1947.

Past history: "Pleuropneumonia" at age of two, left, surgical drainage, frequent mild head colds. Kidney stone passed in 1943. Appendectomy in 1904. Cigarettes, one-half package daily; no alcohol. Past three months severe retrosternal pain with sensation of pressure or squeezing of chest on effort, often while working as auto-mechanic and occasionally at night, waking him from sleep. Pain goes into both arms, may last five to ten minutes if he ceases effort or takes nitroglycerin tablet under tongue, but the remedy causes headache. On one occasion two months ago the pain lasted a half day. In November on deer hunting he was without discomfort while walking through the woods but had a severe attack of retrosternal pain on arrival in camp. A severe attack is almost unbearable and feels as if his chest would burst. Has had occasional mild attack while sitting in a chair. Much worried over job and prospect of eviction from apartment.

Examination: 5 feet 4 inches, weight 156 pounds, blood pressure 110 systolic, 78 diastolic, traumatic cataract right, ocular reflexes on left normal, knee jerks normal, station normal. Pyorrhea present. Moderately large tonsils with low grade chronic infection. Scars of left thoracotomy and appendectomy. Apprehensive and worried.

Hemoglobin 15.5 grams, white blood count 8,100 in normal percentages, sedimentation rate of red blood cells 6 mm. in one hour. Urine specific gravity 1,020; no abnormalities. Electrocardiogram, normal rate and rhythm, auricular and ventricular complexes normal except for deep Q3 (6 mm.). A six foot x-ray film of the chest shows no pulmonary or mediastinal (heart and great vessels) abnormality. Mantoux skin test 1:1000 negative, cholecystogram negative, barium gastrointestinal study with especial attention to cardia revealed no abnormalities. X-ray films gave evidence of hypertrophic arthritis involving the fifth and sixth cervical vertebrae with spina bifida occulta of the seventh cervical and first dorsal spines.

Diagnosis: Coronary sclerosis, angina pectoris syndrome, pyorrhea alveolaris, arthritis of cervical spine, spina bifida occulta seventh cervical and first dorsal vertebrae.

He was cautioned against activities producing pain, and given aminophyllin, 3 grains in enteric-coated tablets q.i.d. with glyceryl trinitrite p.r.n. He continued his work and experienced little or no change in the amount of exercise possible without pain. An intercurrent incident of pain in the right shoulder and arm led to a spinal fluid study February 14, 1948. This showed normal values in cell count, protein, sugar, and colloidal gold curve and negative Wassermann. In March, 1948, he was much concerned about living quarters. On March 15 toward morning he was awakened by severe retrosternal pain. He took nitroglycerin eight times within two or three hours, each time with brief relief and then a recurrence of pain. Next day he got an extension of occupancy of living quarters and then fainted in court. He was studied for ten days after this; no fever or leuckocytosis and no change in electrocardiograms could be demonstrated. Course continued as before until March 24, 1949, when he wakened at 5:00 a.m. with a severe paroxysmal retrosternal pain which persisted. He was hospitalized until April 30, 1949, the diagnosis by Dr. Olga S. Hansen being acute coronary occlusion with myocardial infarction. The electrocardiograms from March 27 through April showed acutely progressive changes of posterior type infarction. Following discharge from the hospital he began to experience pain on effort as before.

He began Roniacol May 14, 1949. He was observed by the writer after administration of 100 mg. at 4:15 p.m. He reported a sensation of prickling and warmth of face and ears beginning in nine minutes, and this was promptly followed by a visible flush which with the sensation spread over face, scalp, ears, neck, upper chest and to arms and hands within fifteen minutes after the drug was taken. During this period and up to forty-five minutes after administration the blood pressure remained within a range of 120/80 to 124/82 and the pulse rate from 68 to 72.

June 21, 1949: Electrocardiogram showed return toward normal type, but Q3 persisted.

Continuing a total of 400 mg. Roniacol daily, he went to work July 9, 1949, five days a week. Has had mild precordial pain about five times a day.

July 23, 1949: The dosage was increased to 150 mg. q.i.d. a total of 600 mg. daily. Since this increase he has had little or no pain, working forty hours a week with the exception of August 2, 1949, when he had a brief paroxysm on being served with eviction notice.

He has had to learn to work at a moderate pace and develop as much serenity and equanimity as possible. He can bring on slight brief distress if he works hard and fast or hammers hard and vigorously over many minutes, but to him his relief is remarkable.

August 6, 1949: Blood pressure 138/85, heart rate 70 regular. He is taking 600 mg. Roniacol in four doses and working every day with no pain.

August 20, 1949: Blood pressure 142/64, heart rate 75 regular, weight 165 pounds. Has been working regularly since July 11, with no pain except rarely if he works very fast and hard. He can climb stairs and walk indefinitely at moderate pace without pain.

October 10, 1949: He has continued 600 mg. Roniacol daily and remains at work with only very rare paroxyms of pain on distinct overdoing. Both he and his wife feel that his relief has been remarkable.

November 14, 1949: Has been without Roniacol since November 6; worked all week but repeatedly had pain, whereas since early August has been relatively free, developing pain only on severe exertion, working fast, et cetera. Both patient and wife report extreme difference with relapse to former frequency of pain when deprived of the drug.

November 19, 1949: Frequency and severity of anginal pain reduced greatly after resuming November 14, 1949, with 600 mg. of the drug daily. He has worked several days without pain.

Case 5.—J. F. M., a widow, aged seventy, was first seen March 12, 1947.

In 1943, while in California she suffered a severe attack called "flu." Since then she has had severe precordial pain on walking, especially against a wind. The pain extends into the left shoulder, arm, and forearm but is relieved by standing still. For the past two or three weeks her ankles have swelled and she has been dyspneic on exertion.

Examination: Positive Mantoux skin test 1:1000. Chest x-ray showed old apparently healed lesions at the right apex with scattered calcification in the area. The heart is slightly above normal in size with left ventricular enlargement and a slight calcification in the arch of the aorta. Sputum and fasting stomach contents did not reveal acid-fast organisms. Height 5 feet 3 inches, weight 114 pounds, heart rate 96 regular. Peripheral arteriosclerosis 1+. Moist râles in both lung bases on inspiration; post-tussal râles at the right apex. Moderate pitting on pressure of both ankles and feet. Hemoglobin 80 per cent (13.8 grams), white blood count 8,700. Sedimentation rate 12 mm. in one hour. Basal metabolic rate plus 8 per cent. Electrocradiogram showed a rate of 110, QRS .12 seconds, T_1—1mm., T_2—2mm., T_3—1mm.

Diagnosis: Arteriosclerosis, corornary sclerosis, healed pulmonary tuberculosis of the right apex, angina pectoris syndrome.

An acute respiratory infection in July subsided promptly. Blood pressure readings varied from 126 systolic, 82 diastolic on November 14, 1947, to 134 systolic, 84 diastolic on March 10, 1948. Treatment had been principally instruction in avoidance of effort producing pain with use of theobromine sodium acetate and 1/100 grain tablets nitroglycerin p.r.n. There had been no marked reduction of pain attacks on effort, which had occurred three or four or more times a day.

Seen December 21, 1948: On evening of December 18, 1948, she experienced an acute precordial pain after a hot bath and while in bed awake, reflected into the left arm. Dyspnea lasted one hour, after which she fell asleep and during sleep daughter noted periodic breathing (Cheyne-Stokes).

Examination: Weight 110 pounds, blood pressure 144 systolic, 88 diastolic, heart rate 90, no murmurs, moist râles in both lung bases. Spleen and liver normal in size. No edema of the legs present. Precordial pain present on walking, reflects into left arm, subsides on standing still.

December 25, 1948: Electrocardiogram compared with March 14, 1947, shows $T_{1\ 2,3}$ less negative. T_4 less exaggerated and delayed intraventricular conduction.

December 21, 1948: Began use of Roniacol, 100 mg. t.i.d. Record of observations by patient and daughter for twenty-five days: following administration showed uniform reaction beginning in five to ten minutes, lasting twenty minutes to one-half hour with marked reddening of face, neck, upper chest, arms, hands, and fingers with this a feeling of warmth in these regions. During this period bouts of pain definitely lessened in frequency. Nitroglycerin used under tongue on the average once a day.

April 11, 1949: Continuing use of Roniacol. Reports that she has definitely less pain than three months ago, but is more active and uses nitroglycerin under tongue four or five times a day as a rule. Warned again against activity producing pain. Instructed to take 100 mg. tablet Roniacol with meals instead of before.

June 10, 1949: Taking drug with meals, she does not get the flushed skin and warm feeling. Is much improved. Can walk several blocks without pain. Blood pressure 134/72, heart rate 78 regular. Has not required nitroglycerin since April.

July 19, 1949: An intercurrent acute bronchitis and coarse râles are present over both halves of chest. She can walk many blocks without pain. Continues 300 mg. Roniacol daily. Blood pressure 135/75, heart rate 90 regular. She walks about her own house in comfort and without pain and can even walk many blocks at moderate gait without pain. The patient and daughter report marked improvement in strength, feeling of well-being and endurance as well as tolerance of exercise, most marked beginning in April, 1949. With periods of colder weather there is so far no increase in painful incidents.

October 22, 1949: Has continued Roniacol 300 mg. daily. Weight 107½ pounds, blood pressure 138/88, heart rate 78 regular. Physical signs as before. She reports she is much improved. She can walk about without pain, but does experience pain usually mild and of short duration if there is excitement. Her general appearance is improved.

Case 6.—T. R., a man, aged fifty-seven, was first seen August 7, 1934. He began to have precordial pain on effort in May, 1933. At times it was so severe and constricting he had to walk "bent over." No dyspnea was noted. He reported that his pulse was slow, 60 per minute when recumbent, but would become rapid on arising. He notes that for the past two weeks pain on effort is increasing in frequency, and yesterday was brought on by excitement. For the past ten years there has been a weight reduction from 190 to the present 170 pounds.

Examination: Height 6 feet, good nutrition, with slight atrophy of skin from weight reduction. Blood pressure 138/85, heart rate 78 recumbent. Heart tones clear; no murmurs. Moderate slowing of heart on right carotid sinus pressure; none on left. Moderate respiratory arrhythmia. Peripheral arteries palpable and show slight tortuosity. General physical examination negative. Ophthalmoscopic examination showed vessels consistent with age Prostate 2+ enlarged, soft, not tender, non-obstructive. Expressed fluid shows 3 to 5 leukocytes and 1 to 3 degenerate cells per high power dry field. Heart contour and size showed no abnormality on a 6-foot x-ray film or orthodiagram. Urine negative with specific gravity 1.028. Hemoglobin of blood 86 per cent. Electrocardiogram showed low T_3 with moderate respiratory arrhythmia.

Diagnosis: Coronary sclerosis with angina pectoris syndrome. Arteriosclerosis 1 plus. Hypertrophy of prostate.

Therapy: Instruction in limiting activity to avoid production of pain. Theocin.

Little change occurred throughout the fall and winter, but on March 12, 1935, it is noted: "Has followed instructions regarding limitation of activity in general. When he starts out to walk may have slight pain and feeling of constriction but if he walks slowly this subsides and he can walk slowly, as he wishes." Weight 178 pounds, blood pressure 142/86, heart rate 84 regular. Again conditions quite stabilized with occasional pain on unusual effort or excitement.

An electrocardiogram June 5, 1939, showed rate of 100, low amplitude of QRS 1, 2, and 3 with R_4 absent and T_4 exaggerated.

In July, 1940, symptoms suggestive of prostatic obstruction developed.

Electrocardiogram July 30, 1940, showed voltage of QRS 1, 2, and 3 increased over June 5, 1939.

August 11, 1940: Intravenous urograms showed moderate pyelectasia and ureterectasia, right, with deformity at base of bladder suggestive of enlarged prostate. Also chronic hypertrophic changes in lumbar vertebrae and right sacroiliac joint.

August 20, 1940: Transurethral prostate resection by Dr. Gilbert J. Thomas with uneventful recovery except for mild left epidymitis which subsided.

In the winter of 1940-41 he was in California and had more frequent anginal pain possibly because of necessary hill climbing, but on return home late in February there were less frequent pain episodes with restricted activity. On resuming theocalcin he thought his range somewhat increased.

In April, 1943, ventricular extrasystoles developed and from that time on until 1948 were quite well controlled by quinidine sulfate, 3-grain capsules given twice daily with morning and evening meals. Theocin, aminophyllin and theobromine sodium acetate were given at various times in doses to limit of tolerance by mouth with variable effect, sometimes seeming to increase tolerance to exercise, again with indifferent results. It is noted that tortuosity and thickening of peripheral vessels has increased to 2+.

November 7, 1946: He reported that on or about October 10, he had an episode of the usual type of precordial pain lasting about six hours which recurred for a shorter period two days later, but he did not call a physician. Since then pain has recurred more readily and earlier on walking. Examination showed blood pressure 150/80, heart rate 80, regular, no fever, no hyperleukocytosis, no increased sedimentation rate of red blood cells and no essential changes in electrocardiogram.

May 17, 1949: He reported after several months' absence. The usual type of precordial pain develops on walking three blocks at a moderate gait. Blood pressure 168/80, heart rate 80 and regular, falls after ten minutes of rest in a recumbent positon to 154/74, heart rate 74. X-ray revealed no changes in heart size or contour since first seen. Hemoglobin 15.5 grams.

May 28, 1949: 100 mg. Roniacol given by mouth three hours after breakfast and observations noted. The reactions were similar to those reported in other cases.

He has been on Roniacol 100 mg. with meals and at bedtime, the past 10 days, and this dosage has been continued through the period of this report.

July 1, 1949: Blood pressure 128/75, heart rate 96. He reports more relief from pain and greater range of activity without pain than he has experienced with any other medication since 1934.

July 23, 1949: Beginning about three weeks ago he took an hour's sun bath daily for six days; none since. During this period he began to notice pain after walking a block or two, the pain going down left arm to the elbow, for the first time in his experience. He ascribed it to sleeping poorly. He quit the sun baths, and the pain attacks "lifted," i.e., he could again walk several blocks without pain.

August 9, 1949: Much improved. Sometimes he can walk at a moderate gait half a day without pain. He notes that the drug is followed shortly by redness and sense of burning and tingling with flush of face, neck, and upper part of torso.

October 1, 1949: Weight 187 pounds, blood pressure 156/85, heart rate 76 regular. If he eats an unusually heavy breakfast he may have precordial pain on walking three or four blocks, but if not he can walk three or four miles without pain. After such a long walk he may have palpitation, with a definite sense of irregularity from premature beats. This may last a few minutes only but on rare occasions three or four hours, or if he walked a good deal on a certain day, he may have the same experience on lying down at night to sleep.

November 23, 1949: Physical condition unchanged. His report: "I am able to walk farther and at a quicker pace without pain than has been my experience since 1934. I walk miles and go many days without pain. I do not tire so readily and my head is clearer."

Case 7.—L. L. S., a man, aged seventy-four, was admitted to the hospital November 24, 1948.

After heavy work at the age of twenty, he began to have pain in the lumbar and sacro-iliac regions and in 1932 his left hip became painful and lame.

In 1935 he had a transurethral resection under spinal anesthesia, involving the median lobe of the prostate. At that time x-ray films showed moderate calcification in margins of intervertebral cartilages, most marked between the first and second vertebral bodies, and the left hip showed slight flattening of head of femur described as "malum coxae senilis, a traumatic form of hip arthritis." Also senile cataracts were noted, most advanced in right eye. The tonsils were reported adherent and infected. Blood pressure was reported 140 systolic, 100 diastolic.

Present condition: Beginning in 1946, he experienced precordial pain on severe exertion, such as mowing the lawn, and beginning about mid-September, 1948, a retrosternal pain has occurred much more readily on exercise, especially after a meal. If he sits down, pain disappears after fifteen to twenty minutes, but if he continues, pain increases, spreads into both shoulders and arms, and into right mandible. The arms feel weak for half an hour after the pain ceases. Digestion good, nocturia once.

Height 5 feet 10 inches, weight 177 pounds (was 212 pounds twelve years ago and 185 pounds a month ago). Blood pressure 162 systolic, 92 diastolic. Moderate atrophy of skin, limitation of about one-third in flexion of left hip, adherent infected tonsils, cataracts most marked in right, peripheral arteriosclerosis 2+ (on a scale of 4). Chest and abdomen revealed no abnormalities. Ophthalmoscopic examination: Left eye showed generalized constriction of arteries with increase of light reflex and marked compression of veins at the arteriovenous crossings. A small superficial hemorrhage was found to the temporal side of the disc between it and the macula. The right eye showed hypertrophic capsular tissue. A six-foot x-ray film of the chest showed the heart diameter 13.1 cm. with a cardiothoracic index of 41 per cent, the heart contour suggestive of left ventricular hypertrophy. The aortic arch showed calcification in the wall.

Urinalysis normal. The hemoglobin was 17.0 grams, white blood count 9,500 in normal percentages. The sedimentation rate of the red blood cells was 2 mm. in one hour. The electrocardiogram showed left axis deviation with flat T_1, and deeply negative T_4 consistent with fairly recent myocardial damage.

Diagnosis: Coronary sclerosis, angina pectoris syndrome, Hypertrophic arthritis of the spine.

Roniacol 100 mg. tablets, was begun November 26, 1948. Taking them before a meal, in about five minutes he experienced the typical flushing and feeling of warmth lasting fifteen to twenty minutes.

His physician writes under date of January 18, 1949: "Mr. S. came in for a checkup this morning and I am happy to report that he has been much better since using Roniacol. On Wednesday of last week he made several trips to town, exerting more than usual, and had a recurrence of his pain. He frankly admits he probably did too much. He is feeling better again and is much encouraged." Shortly after this report the patient discontinued Roniacol, reporting recurrence of anginal attacks and failure to get relief from the drug. It has not been learned whether he has had an extension of his underlying coronary sclerosis.

Case 8.—A. H. C., a man, aged sixty-eight, had been a moderate smoker, and a moderate to heavy user of alcohol up to 1926, but none since. A waiter by trade, he had not worked since 1946.

Examination: Height 6 feet, weight 147 pounds (20 pound weight loss in two years), blood pressure 170 systolic, 100 diastolic, pulse 100 per minute regular.

Diagnosis: Arteriosclerosis with aortic and coronary sclerosis, cardiovascular disease with hypertension and the angina pectoris syndrome, benign prostatic hypertrophy, pulmonary emphysema.

Roniacol was begun in December, 1948, 100 mg. q.i.d. On December 20, 1948, the dosage was decreased to 50 mg. t.i.d. with emotional discomfort. On February 22, 1949, Roniacol was discontinued because of continued abdominal discomfort with increasing cardiac discomfort.

Case 9.—O. F. N., a man, aged fifty-three, a violinist, was admitted to the hospital October 23, 1945. Patient had received an honorable discharge from the U. S. Navy in 1919 because of nervous disability, service connected, and coronary trouble, non-service connected. In 1939 while portaging a canoe, he had had a severe precordial pain lasting three days in all. A diagnosis of coronary thrombosis was made, and he was kept inactive for three months. He resumed teaching the violin until 1942, when he had a severe precordial pain while draw-shaving logs. Again he was compelled to rest. Some months later he began to have retrosternal pain extending into the left elbow on walking a block or more; he would stop, and the pain would promptly subside; he would walk again and have to stop. Within a year, i.e., some time in 1943, he began to have the pain sometimes for thirty to sixty minutes after a meal, on listening to the radio broadcast of a football game, or hearing a fire engine siren.

Examination: Height 5 feet 6½ inches, weight 181 pounds, blood pressure 210 systolic, 142 diastolic. Peripheral arteriosclerosis 1+ (on a scale of 4). Aortic second tone accentuated, no murmurs heard, no visible or palpable increase in precordial pulsation. Digital rectal examination of prostate with expression of secretion revealed 25 to 30 pus cells with clumps per high power dry lens microscopic field. Prostate was massaged at five to seven day intervals by Dr. H. A. Reif, and at the end of two months cell content had reduced to approximately 5 to 8. A gall-bladder dye test and barium gastrointestinal study by x-ray with especial attention to the lower esophagus and cardia revealed no abnormalities. A six foot x-ray film of chest revealed a 40 per cent cardio-thoracic index with normal contours of heart and mediastinum. Urine negative, hemoglobin 18 grams, red blood count 5,500,000, white blood count 6,200 in normal percentages, sedimentation rate of the red blood cells 3 mm. in one hour. Electrocardiogram showed normal complexes.

Diagnosis: Arterial hypertension, angina pectoris syndrome, overweight.

A reducing diet was ordered and instruction in avoidance of effort causing pain was given. He was seen on rare occasions, eight in all, until April 17, 1947, on which date his weight was 165 pounds, and a blood pressure reading was 146 systolic, 100 diastolic. During this eighteen-month interval the weight reduction had been gradual, but the 30 pound weight reduction recommended had been attained only in part. Blood pressure readings varied between 170/95 and 154/100 between December 3, 1945, and March 27, 1947. During this period for approximately the first six months there seemed to be little change in the amount of effort producing pain, but he followed instructions quite carefully and the painful episodes were much less frequent. On rare occasions the pain would occur at night as it had before. Nitroglycerin 1/100 grain seemed to give relief.

He was not seen again until April 12, 1949. There was increasing frequency of pain episodes, less care in avoiding causative effort, and pain was occurring more frequently at night. Weight had increased to 171 pounds, and blood pressure was 172 systolic, 104 diastolic, heart rate 84. No essential changes in physical examination or electrocardiogram. He was given Roniacol in 100 mg. tablets to be taken t.i.d. and instructed again in avoidance of effort causing pain.

April 26, 1949: Blood pressure 210 systolic, 115 diastolic, heart rate 84. Reports same type of reaction after the drug as noted in other patients. A full 100 mg. dose gave so violent and disagreeable a reaction that half tablets (50 mg.) were taken regularly after April 26. Mild reactions occurred in similar fashion if the dose was taken on an empty stomach and no reaction sensed if taken with food. However, he was able to accomplish distinctly more work without pain than formerly. On two occasions he reported bouts of pain about 11:00 p.m. about four hours after taking the drug with a meal and then exercising quite severely.

November 10, 1949: Continues to excite pain on effort with the excuse that there is no one else to perform the services required. He experiences no relief from Roniacol but feels that he does get some relief from quick vasodilators such as nitroglycerine which he takes three, four, and five a day. Roniacol discontinued.

Case 10.—W. J. N., a man, aged forty-eight, was first admitted to the hospital September 27, 1948.

He reports that he froze his hands and feet in 1935 at a temperature of –32° F. but suffered no destructive lesions.

In April, 1948, he thinks he had a sliver or bruise at the tip of the middle finger of the right hand. A sinus was found extending to the bone about the second week in August. Since then there has been marked pain, worse when the hand is held up. The pain is relieved somewhat by holding it at knee level with the body bent forward and the right hand slightly squeezed and massaged by the left hand. This sinus does not heal. About the middle of August, 1948, began to have a brownish spot at the tip of the middle finger of the left hand. Thinks he may have had a slight bruise there. It was painful to touch at the tip where a small crust had developed.

Examination: Height 5 feet 8½ inches, weight 164 pounds, pulse 76 per minute and regular, blood pressure 135 systolic and 80 diastolic. There was a large area of urticaria over the epigastrium and legs. There were numerous lipomata of the forearms, torso and thighs. The mouth is furnished with an upper plate and lower partial. The tonsils are cryptic and buried. The peripheral vessels show a 1+ arteriosclerosis. There is evidence of a discharging granulating area at the tip of the right middle finger. The hands are red and the nails cyanotic. There is a small crust at the tip of the left middle finger; tips of all other fingers are red and tender. There is an area of redness and slight edema of the dorsum of the right foot and over the outer malleolus. He can walk without developing cyanosis in the feet, and on elevation the skin becomes waxy white and is slow to regain its color. X-ray film of the chest shows the heart normal in size and position. The lung fields are clear. X-ray of the right leg shows no evidence of calcification in the vessels.

The hemoglobin is 18.0 grams, red blood count 5,100,000, leukocytes 10,500, with 56 per cent polymorphonuclear cells, 41 per cent lymphocytes, and 1 per cent monocytes. The urine is normal. The electrocardiographic tracing shows normal complexes.

Diagnosis: Peripheral vascular disease, remote result of congelation.

On September 24 the patient was placed on Roniacol in 50 mg. doses q.i.d. He was instructed to take it in two ways: (1) about twenty minutes before a meal and on retiring, (2) with meals and on retiring, and to report if any difference is experienced. He notes that when taken on an empty stomach he would have a distinct sense of warmth around the face, ears, and upper chest and also in both hands, and this positive sense of warmth together with increased redness of hands would persist for one-half hour or more after each dose. This phenomenon did not develop when the drug was taken with the meal. By November 1 it was noted that the hands were healing somewhat, and the distinct impression was gained that the preparation had been effective as a vasodilator in the extremities.

In the meantime, on October 4, a cervical sympathetic block on the left side with 1 per cent novocaine had been done by Dr. Wallace I. Nelson. The regions of the upper, medial, and lower left sympathetic ganglia were each infiltrated with 10 c.c. of a 1 per cent novocaine solution. After this had been done the patient stated that the left hand did not feel any warmer than the right but "it felt like it felt years ago." It felt normal while the right hand had a "tingly" feeling. After this procedure, the lateral cord of the plexus was injected and this produced an immediate sensation of warmth in the left extremity. This tends to show that it is a nerve supply to the vascular system of the extremity that is involved.

On the basis of this information a right-sided high thoracic sympathectomy of the pre-ganglionic type under sodium pentothal anesthesia was done by Dr. H. F. Buchstein assisted by Dr. Wallace I. Nelson. The procedure was accomplished without difficulty, and the patient was returned to his room in good condition. The pleura was not opened.

The Roniacol was continued after the operation, and healing of the left middle finger continued but was slow, and on November 17, 1948, a high thoracic sympathectomy, pre-ganglionic type, was done on the left side. The same procedure was carried out on the left side as was done on the right. On December 1, 1948, it was noted that the wounds of the fingers were well healed and the fingers warm.

Case 11.—E. M. G., a man, aged thirty-seven, a patient of Dr. G. G. Bowers, was first admitted to the hospital April 5, 1949.

The patient had had poliomyelitis at age three, but sustained no residual paralysis. He was an office executive, a social drinker, smoked one package of cigarettes a day and drank six to ten cups of coffee daily.

He began having pain in the left great toe early in November, 1948, which would persist a day, then be gone three or four days. He had been hospitalized in March, 1949, for three days. After discharge from the hospital all his toes turned "black and blue," and he had severe pain in the toes and muscles of the lower leg. Under the nail of the left great toe the pain was very severe and throbbing. The left now developed a pain on walking one and one-half blocks and exhibits red painful areas in the lower half of the leg.

Examination: Height 5 feet 4 inches, weight 163 pounds, temperature 98, heart rate 80, blood pressure 140 systolic, 88 diastolic. Reflexes normal. On walking there is a marked cyanosis of the left foot and great toe. Moderate cyanosis of the right foot is relieved by elevation. The feet feel cool to touch. The posterior tibial and dorsalis pedis pulsations are not evident on the left, and the popliteal pulsation is weak. Good pulses are present on the right. A six foot film of the chest shows a cardio-thoracic index of 50 per cent. X-ray films of the legs show no evidence of calcification in the vessels. Dental x-ray survey for vitality shows all negative. Kline exclusion test for syphilis is negative. Urinalysis negative, hemoglobin 15 grams, red blood count 4,270,000, white blood count 15,000 with a normal differential count, sedimentation rate 6 mm. in one hour, blood uric acid 4.75 mg. per cent (April 11) and 4.0 mg. per cent (April 9).

Diagnosis: Thrombo-angiitis obliterans (Buerger's Disease).

April 9, 1949: Began Roniacol 100 mg. t.i.d.

April 18, 1949: On taking drug has had flushing in face and forearms beginning in five to ten minutes—this lying down but not if up and about. Pain is now limited to the throbbing pain under his left great toenail. Posterior tibial and dorsalis pedis artery pulsation on the left is now felt whereas it was formerly absent, but the pulsation is weaker than on the right. The left foot is cool to the ankle. Today he walked thirty blocks without leg pain.

Dosage of Roniacol increased to 150 mg. q.i.d. (600 mg.) daily.

After two days of increased dosage all the pain had disappeared from the left leg and foot, and he reported that now after taking the drug "I would really get red" with a more marked burning and prickling sensation in the top of his head, in the face and forearms. He has experienced no sweating at any time.

Following the demonstration of circulatory improvement by vasodilatation, a left lumbar sympathectomy was performed by Dr. Wallace I. Nelson on June 3. At the time of the operation, smoking was discontinued and has not been resumed.

On June 9, the sixth day postoperative, the left thigh, leg and foot were distinctly warmer to touch than the right, and the skin color definitely redder. Pulsations were felt in the popliteal dorsalis pedis and posterior tibial arteries. On the right the pulse in the popliteal artery was faint, in the dorsalis pedis absent and in the posterior tibial faint. Blood pressure 128 systolic, 74 diastolic, heart rate 78, regular. 100 mg. Roniacol were given with water on an empty stomach at 8:45 a.m. Observations revealed a brief blood pressure rise to a maximum of 132 systolic, 84 diastolic, which later returned to 126 systolic, 74 diastolic, the heart rate rising to 90 within fifteen minutes and promptly, i.e., within twenty-five minutes, subsiding to 72 per minute. Beginning within twelve minutes, paresthesia with a sensation of warmth in the face, ears and neck spread to the upper chest and later to the arms, with visible marked flush of same areas and increased warmth to palpating hand. In exactly twenty-minutes he announced that while previously there had been some pain in left toe, this had now ceased. Redness and paresthesia lasted a full hour. Within three weeks after operation, he resumed his full duties in business and has remained well and at work.

November 17, 1949: He has taken no Roniacol since September 15, 1949. He reports that since the operation the left thigh and leg and especially the foot are constantly warmer than the right. The right foot and ankle often feel cold to touch and often on retiring he has a sensation of cold in this foot. He then places the sole of foot on left thigh and it soon becomes warm.

Examination: Weight 166 pounds, blood pressure 122 systolic, 76 diastolic, heart rate 75 regular. General physical examination negative except for legs and feet. Left thigh, leg and foot are warm to touch, definitely brighter pink in color than the right and there is prompt return of a pink color to the skin after removal of pressure. He reports there is no sweating in this extremity. Right thigh and upper two-thirds of right leg are approximately as warm to touch as the left but there is less redness to the skin. Below a fairly well demarcated line between the middle and lower thirds of the leg, the skin temperature is palpably much cooler than the left and return of color after release of pressure is slow. On walking briskly no color change is noted in the left foot and ankle, but the right becomes paler and on resting a faint cyanosis is visible. On elevating and depressing the right foot, color changes develop slowly as compared to the left.

Case 12.—E. S., a man, aged seventy-seven (reported by Dr. A. L. Miller), was first admitted to the hospital May 1, 1949.

Examination: Height 5 feet 5½ inches, weight 120 pounds, previous weight 160 pounds, forty pounds weight loss in the past four to five years. Blood pressure 184 systolic, 90 diastolic, heart rate 60 per minute. He is lean ruddy faced, sullen, obstinate and negativistic. He has neurotic excoriations on his back, has presbyopia but does not wear glasses, all his teeth have been extracted, and his chest is emphysematous. The heart apex is in the fourth interspace at the nipple line; a 2+ systolic murmur is heard at the apex. The peripheral vessels show tortuosity and thickening, arteriosclerosis 4+. No posterior tibial or dorsalis pedis pulsation can be felt. The left leg had been amputated above the knee because of an accident in 1946. In the dependent position the right leg shows a marked cyanosis up to the knee. On elevation there is a marked pallor, a rubor when lying down. He has been under treatment with niacin, nitranitol and various other vasodilator drugs without improvement.

Diagnosis: Arteriosclerotic peripheral vascular disease of the right leg.

September 27, 1949: Roniacol 100 mg. q.i.d. with meals was begun. With the first dose given before a meal, he became so flushed and confused that the nurses were alarmed. The flushing and confusion lasted for about an hour. Later doses that day were given with meals. After a week he still flushed considerably and had some restlessness up to one-half hour or more after each tablet of Roniacol.

October 7, 1949: He appears to have less acrocyanosis and more warmth. Flushing still occurs after Roniacol.

October 15, 1949: Conditions about as above. No pulsation can be felt.

October 20, 1949: After taking Roniacol flushing is less. Patient is more co-operative, speaks a few words, and there is less acrocyanosis and definitely more warmth but no pulsation in the extremity.

October 21, 1949: Leg is less cyanotic but definitely warmer and the patient desires less covering over the leg. In the dependent position there is distinctly less cyanosis than previously. On taking the drug, flushing and sense of warmth begin in about ten minutes, last for about one-half hour, and then tingling and restlessness diminish gradually. Since October 15 patient has been more alert, less obstinate and speaks occasionally though rarely. He has in the past usually sat uncommunicative in the corner. The past few days he has been wheeling his chair up and down the hall. It is difficult to associate this fact with the medication but it is not accounted for otherwise. Roniacol has definitely benefited this man as to peripheral vascular dilation and circulation, but as to cerebral stimulation further treatment and evaluation will have to be made. The medication is tolerated and has been taken more readily in the past two weeks. Prior to this time he would spit out any medication. In that it is hard to communicate with the patient we cannot evaluate our treatment from the subjective side other than his apparent willingness now to take Roniacol.

Case 13.—H. K., a woman, aged ninety-two (reported by Dr. A. L. Miller).

No past family history is available as the family is quite passive concerning the patient. No children are living.

Examination: Height 5 feet 2 inches, weight 138 pounds, no essential change for several years. Blood pressure 142 systolic, 80 diastolic. Urinalysis showed a trace of albumin, no casts, no pus. Wassermann test negative. Blood normal on examination. The right hip has been nailed. She has generalized arteriosclerosis with mild senility, hypertrophic arthritis, cardiovascular disease with previous hypertension.

The patient was admitted July 29, 1949, with deep gangrenous ulcers of both heels due to arteriosclerosis and decubitous pressure. The ulcers did not heal and on August 16, 1949, penicillin 300,000 units started daily and Roniacol 100 mg. q.i.d. daily, given after meals. Heat lamp and zephiran chloride irrigations started; also oral unicaps t.i.d., and the patient began sitting up in a chair.

August 23, 1949, penicillin was discontinued as the pus was gone, the ulcer craters were clean and granulations noted. The skin felt warm, and the patient reports some tingling sensations after taking the medication. The margins continued to heal, and on September 10, 1949, zephiran chloride irrigations were discontinued. She expressed no discomfort from Roniacol.

September 30, 1949: The ulcers were nearly healed.

October 10, 1949: Epithelization was complete and the ulcer entirely healed. The skin of the extremities was warm.

Case 14.—F. E., a man, aged eighty-four, was seen April 19, 1949 (reported by Dr. A. L. Miller).

Examination: Height 5 feet 10 inches, weight 138 pounds, a gradual loss from 180 pounds in the past twenty years. The patient is a large boned, muscular man. Blood pressure 196 systolic, 100 diastolic, pulse 68 per minute, absolutely irregular. Wassermann test negative; sputum negative for acid-fast bacilli; blood and urine negative. Skin dry and atrophic, toe nails deformed; chest, barrel shaped and emphysematous, inspiratory and expiratory musical wheezing, depressed lung borders and little chest expansion. Heart tones soft, absolutely irregular, rate 68; apical beat visible at nipple line fifth interspace, no murmurs. The peripheral vessels showed tortuosity, arteriosclerosis 4+. Dorsalis and post tibial vessels not palpable on the right. Left leg had been amputated for arteriosclerotic gangrene in 1947. A gangrenous ulcer is present on the right heel, 4 cm. in diameter with a gray foul-smelling pus. The surface of the os calcis is exposed, and there is a black ring at the margin. The skin about it is dry and cool.

Diagnosis: Arteriosclerosis, decubitus ulcer right heel.

On April 19, 1949, treatment was begun with a heat lamp and frequent turning in bed with daily irrigation with zephiran chloride 1:1,000. By May 13, 1949, there was no improvement and the os calcis was clearly visible. 300,000 units of penicillin were given daily. Heat lamp, irrigations and frequent turning were continued.

May 25, 1949: The wound was cleaner; oozing pus had discontinued, healing was stationary. Penicillin was continued and vitamin B complex and vitamin C started.

June 10, 1949: The ulcer was dry but not healing. Roniacol, 100 mg. q.i.d., started.

June 17, 1949: The size of the ulcer has not decreased but the darkened margin is showing granulation as is the base of the ulcer. Penicillin discontinued. Roniacol, 800 mg. daily, continued.

June 21, 1949: Infection seems to be increasing again, and penicillin 300,000 units daily resumed.

June 28, 1949: Penicillin, vitamin B. complex and vitamin C stopped. Roniacol 400 mg. continued. Ulcer margin has closed in about 25 per cent. The foot feels warmer. No dorsalis pedis or post-tibial artery palpable. Use of heat lamp discontinued.

July 8, 1949: Foot feels warmer, ulcer about 50 per cent less in depth and extent. Acrocyanosis of toes and distal half of foot is decreasing. The skin of the leg seems to show less atrophy than before.

August 15, 1949: Ulcer nearly closed. Skin of foot and leg nearly as warm as thigh.

September 8, 1949: Ulcer covered and scar contracting, foot warm.

September 15, 1949: The Roniacol has been temporarily discontinued; foot perceptibly cooler. Acrocyanosis greater. Roniacol resumed.

October 25, 1949: Ulcer has entirely healed. Roniacol continued.

Case 15.—J. A. C., a housewife, aged fifty, was admitted to the hospital October 3, 1949.

Patient had had a duodenal ulcer in 1943. Symptoms had been relieved by dietary regimen and medication. Symptoms of osteo-arthritis in the knees in 1946 had been relieved by weight reduction. A mild acne rosacea of the nose, cheeks and forehead was present. Menopause occurred in 1948. Her childhood home had been broken by her parents' divorce. She is highly sensitive, highly reactive, has often had a feeling of guilt for "pushing my parents out of my life" after her marriage and resents her husband's feeling that she is wholly responsible for the children.

Beginning about 1943, she began to experience attacks in which the four fingers of each hand would become pale and numb. Prolonged rubbing would result after many minutes in some return of sensation but the fingers would become blue, sting and burn, eventually becoming normal in color. These attacks were brought on by exposure to cold or by activities involving elevation of hands and arms such as painting, hanging out clothing, et cetera.

Examination: Height 5 feet 2 inches, weight 142 pounds, blood pressure 125 systolic, 72 diastolic, heart rate 75 regular. General physical examination was negative except for very mild acne rosacea. The color of her hands was normal at rest but on elevating them above the level of the shoulders for one minute and then placing them on her knees, her fingers were at first noticeably pale and her sensation to touch was greatly reduced. She described the sensation as "numb." In about thirty seconds her fingers became definitely cyanotic, and she described a burning sensation. Cyanosis with slow return of color after release of pressure persisted for about ten minutes.

Diagnosis: Raynauds disease.

October 3, 1949: Began Roniacol, 50 mg. before each meal and on retiring.

October 11, 1949: Patient stated that she at first took 50 mg. of Roniacol before each meal which was followed in about ten minutes by a "fiery redness" of the face, neck, upper chest and arms with a "burning" sensation over the same areas. For the first three days there was brief colicky pain in the stomach region before the redness of the skin appeared. After this she took the drug with meals and on retiring, experiencing only a mild flush but no pain and no burning sensation. On the third day of use while doing dishes, she experienced an unusually mild attack in which her fingers became "tingly" but not numb. On the fourth day she forgot the remedy before retiring and had a more severe attack with numbness but less pallor than usual. With the cyanotic period some swelling of fingers occurred. Since that time she has been free from attacks even under provocation, except that on the eighth day of medication, while peeling apples, pallor and numbness developed but normal sensation and appearance developed promptly with rubbing. This occurred much more promptly and readily than before the use of the drug. (She recalls now that at childbirth on December 10, 1924, she had scopolamine twilight sleep, and for a month following this had cold, numb hands. This ceased after a month, to recur paroxysmally in about 1940.

October 26, 1949: She finds that best results are secured by taking 50 mg. of Roniacol with a small breakfast and 100 mg. at noon and evening meals. She was directed to take either 50 or 100 mg., whichever she finds convenient, on retiring also. She reports she can do much more and can tolerate more severe cold than before. On a cold morning recently she had mild symptoms and mild pallor in the fingers. She is now driving her car with comfort, although for eight years she has not dared to drive the car on cold days.

From last reports she has only slight symptoms with the hands, is much better in every way, and is less nervous, irritable and apprehensive than before.

ASSOCIATED DISEASES OF THE SKIN AND EYE

EDWARD P. BURCH, M.D., and CHARLES D. FREEMAN, M.D.
Saint Paul, Minnesota

THERE are a large number of diseases which may jointly involve the eye and mucocutaneous surfaces of the body and are therefore of mutual interest to the dermatologist and ophthalmologist. It is the purpose of this discussion to invite attention to some of the more interesting diseases which fall into this category, and to elaborate upon their clinical manifestations.

Among the more common diseases which demand the collaboration of specialists in these two fields is rosacea. It is a disease of adult life which attacks the skin of the face, involving particularly the nose and cheeks. Transitory attacks of vasodilatation in these areas finally become permanent with concomitant hypertrophy of the sebaceous glands, which usually become chronically infected. The etiology of this very disfiguring condition remains obscure, although abnormality of the gastric secretion with achlorhydria, a diet excessively rich in carbohydrates and condiments, over-indulgence in alcoholic beverages and endocrine disturbances have all been suggested as possible incriminating factors. The ocular lesions usually commence as a mild blepharoconjunctivitis. At a later stage, corneal involvement occurs, and unless effective therapeutic measures can be effected, serious visual damage may ensue. Initially, there occurs a marginal vascularization of the cornea. As vascularization progresses, greyish subepithelial infiltrates are noted. Ultimately, the process involves the corneal stroma, advancing relentlessly toward the pupillary area of the cornea. The vascular loops become more prominent and as the overlying epithelium degenerates, ulceration usually attended by secondary infection takes place. Finally dense, facetted, chalky-white and heavily vascularized scars are formed. Systemic treatment is of importance. The diet should be properly regulated, with a reduction in the carbohydrate intake. Condiments of all varieties should be interdicted. Large amounts of riboflavin should be administered. Roentgen and ultraviolet therapy to the facial lesions is often beneficial. Local antiseptics are of value in combatting secondary infection in the eye, and the photophobia and blepharospasm which may be quite marked are alleviated by means of atropine and tinted lenses. The corneal lesions respond to beta irradiation in a sufficiently high proportion of cases to warrant a thorough trial with this type of therapy. Quite recently desensitization to the male sex hormone has been advocated. With this latter procedure we have had no firsthand experience, but recent reports in the ophthalmic literature have been encouraging.

Erythema multiforme is still another disease which affects both the skin and eyes. Of toxic origin, it is often accompanied by fever, generalized malaise and joint effusion. The skin eruption characteristically consists of symmetrically situated, circular, well-demarcated erythematous patches, associated with a central edematous exudate. The hands, forearms, face and legs may be involved, as well as such mucous surfaces as the conjunctiva, mouth and vagina. Not infrequently the conjunctival lesion is the initial manifestation. It may assume a catarrhal, purulent, or pseudomembranous form. In the catarrhal variety, numerous raised areas appear on the bulbar conjunctiva. The adjacent conjunctiva becomes markedly congested. Secretion is scanty, but lacrymation, blepharospasm, photophobia and intense itching are usually noted.

The so-called Stevens-Johnson syndrome, with cutaneous rash, severe stomatitis and profuse conjunctival discharge is rare. Marked chemosis, subconjunctival hemorrhages and marked conjunctival exudation, followed by corneal involvement usually constitutes the course of events. Ulcerative keratitis with performation of the globe and loss of the globe has been known to occur.

The most common ocular form of the disease is pseudomembranous conjunctivitis. The membrane usually involves both palpebral and bulbar surfaces. Edema of the lids, chemosis of the conjunctiva and profuse exudation are prominent features of the pseudomembranous form. As a rule, corneal involvement with varying degrees of opacification takes place and a fulminating type of exudate cyclitis may further complicate the clinical picture.

Treatment consists of frequent instillation of mydriatic drugs such as atropine, penicillin locally and sulfa drugs or penicillin systemically in heavy doses; however, it must be remembered that the sulfa drugs may produce this condition. If there is a profuse discharge, frequent argyrol and boric irrigations may afford some relief. While the illness may be severe from the general standpoint, recovery is the rule. There may be, however, severe visual damage as a sequela of the keratoiritic process.

Erythema nodosum is another disease of obscure origin which evinces a predilection for children and young adults of the female sex. Both rheumatic fever and tuberculosis have received attention as possible etiological factors. The skin eruption is ushered in with joint pains and high fever. The cutaneous involvement consists of dark red or purplish red swollen areas which appear in successive crops over the arms, legs, shoulders and face. The edematous plaques involve the entire thickness of the integument and have a highly distinctive appearance. Concurrently, subconjunctival lesions may occur. These are usually located between the cornea and caruncle. They are either vesicular in appearance or may be nodular and are freely movable over the underlying sclera. No treatment is indicated, since the ocular lesions disappear as the general disease subsides.

In 1889, Doyne reported the first well-documented case of angiod streaks of the choroid. This condition, which is frequently associated with pseudoxanthoma elasticum of the skin, was first recognized by Groenblad and Strandberg as a generalized disease of elastic tissues with the eye as a special site of predilection. Essentially, the disease involves the corium of the skin and lamina vitrea of the choroid. It is thought to be due to an inherited developmental defect of elastic tissues in the regions cited above. It may occur at any age but usually occurs before the age of forty. The skin lesions, first described by Darier, consist of a symmetrical thickening, softening, and relaxation of the skin, particularly in the folds in proximity to large joints. A yellowish discoloration of the affected skin takes place. In the eye, the lesions are always bilateral. The subretinal streaks resemble blood vessels in appearance. Their color may be red, brownish or gray. Ordinarily, the streaks anastomose in the region of the nerve head, sometimes forming an incomplete circle from which the angioid streaks radiate toward the equator. The streaks invariably lie behind the retinal vessels, and histopathologic investigation has shown that they represent rupture of Bruch's membrane, the lamina vitrea of the choroid. Frequently, retinal involvement with severe disturbance of central vision occurs as the result of transudation or hemorrhage through the ruptures in the lamina vitrea. Eventually connective tissue proliferation takes place and a pseudotumor involving the macular region may result. This lesion closely resembles the disciform degeneration which is so characteristic of Kuhnt-Junius disease.

Molluscum contagiosum is an infectious disease which frequently affects the lid margins and conjunctiva, as well as any of the skin surfaces. A filter-passing virus is the causative agent, and the lesions are very characteristic in appearance, consisting of small circular tumors with an umbilicated center from which necrotic tissue containing the molluscum bodies can be expressed. Catarrhal conjunctivitis or even actual conjunctival growths resembling those seen in the skin and lid margins constitute the usual ocular findings. Expression of the contents of the tumor and cauterization with pure phenol constitute the treatment of choice. Sulfapyridine has also been advocated in small children.

A peculiar and somewhat rare form of uveitis which is invariably accompanied by dysacousis, alopecia, poliosis and vitiligo has been reported by a number of ophthalmologists. The uveitis is severe, and visual damage is the rule. No definite cause has ever been ascribed to this curious syndrome which is usually given the eponymic designation of Koyanagis' disease. A virus etiology has been suggested. Treatment of the uveal tract inflammation is nonspecific, and the partial deafness and cutaneous manifestations do not respond to any form of therapy. The disease principally affects both sexes about equally between the ages of twenty and forty. Poliosis may also occur in sympathetic ophthalmia.

Thallium poisoning deserves mention because of the fact that this heavy metal has occasionally been used as a base in the preparation of depilatory agents. Prolonged use of such agents may be attended by the development of a chronic toxic retrobulbar neuritis. It is prudent, therefore, in toxic amblyopias of obscure origin to question the patient closely concerning the use of substances which have been employed to remove superfluous hair.

Of the vitamin deficiency states which may affect the eye and skin, vitamin A deficiency and ariboflavinosis are of interest. In the former state, the skin becomes loose, its normal texture becomes dry and scaly, and finally keratinization takes place; while in the eye Bitot's spots appear, the cornea loses its translucency, and actual keratomalacia develops. Night blindness may appear as an early sign of lack of vitamin A. If individuals fail to ingest adequate amounts of riboflavin, quite characteristic fissures appear at the angles of the mouth and nose. These tend to bleed readily, become macerated and their appearance is pathognomonic. In the eye, the chief finding is excessive limbal vascularization. In both of these conditions the treatment is self-evident.

A distressing condition which frequently involves the skin of the lids and which may become quite disfiguring is xanthelasma. It is most frequently accompanied by a significant elevation of the cholesterol content of the blood and often occurs in diabetic patients. The typical lesions consist of raised, yellowish plaques situated in the superficial layers of the skin of the eyelids, the upper lids being involved more commonly than the lower. Careful surgical excision of the lesions offers the best method of remedying this unsightly condition. Because of the loose structure of the skin of the eyelids, an excellent cosmetic result can be obtained by surgical methods in the majority of instances.

Of the so-called phakomatoses, tuberous sclerosis associated with adenoma sebaceum is of considerable interest. The typical butterfly pattern of the adenomatous lesions over the upper cheeks and nose is diagnostic. In the eyes, retinal tumefactions may occur in the retina and optic nerve. The intraocular lesions consist of greyish-white or yellow, well-delineated elevations. More rarely mulberry-type retinal tumors are seen. The disease, which is familial and degenerative in character, not only involves the skin, eye and brain, but often the heart and kidneys as well. Because of the cerebral lesions epilepsy is common. The disease is usually fatal.

Von Recklinghausen's disease is another of the phakomatoses with both skin and ocular findings. The cafe-au-lait spots in the skin are easy to recognize. Pigmented naevi and multiple tumors of peripheral and cranial nerves are other manifestations. Tumors of the optic nerve and retina similar to those seen in tuberous sclerosis are not uncommon. Many authorities hold to the opinion that tuberous sclerosis and generalized neurofibromatosis are closely related, the former disease affecting chiefly the central nervous system and the latter principally the peripheral nerves. This variety of the phakomatoses, von Hippel-Lindau's disease or angiomatosis retinae et cerebellae, while involving the eyes, does not give rise to lesions of the mucocutaneous system.

A rather unusual form of glaucoma may occur in patients with nevus flammeus or port-wine stain of the face. This conditon, spoken of as Sturge-Weber disease, may exhibit considerable variation in its clinical picture. The vascular nevi involving the face occur in the distribution of the trigeminal nerve. As a rule, one side only of the face is affected. If the glaucoma occurs in infancy, buphthalmus occurs; while in later life the glaucoma is similar to that seen in the chronic simple form. Cortical calcification occurs in the brain and is accompanied by convulsive seizures. Mental deterioration is the rule. The glaucoma must be treated by means of miotic drugs and, if medical therapy is unavailing, by means of some type of external fistulizing procedure. The port-wine stain is best left alone.

One of the more common diseases of mutual interest to the ophthalmologist and dermatologist is neurodermatitis involving principally the lids. The redness, swelling, intense itching and characteristic corrugated appearance of the lids renders the diagnosis simple. Treatment, if specific allergenic factors cannot be elicited, consists in avoidance of soap and water to the affected region and the application of antihistaminic unguents. These are extremely effective in allaying the marked itching. In women particularly, the possibility of allergy to cosmetics, particularly face powder, eyelash dyes, and nail polish must be carefully excluded.

Another condition of interest is allergic blepharoconjunctivitis due to contact with drugs which are instilled in the eye or applied to the lids. Atropine, pilocarpine, eserine, penicillin and the various sulfa compounds are the most common offenders. The clinical picture resembles that seen in ordinary eczema or neurodermatitis of the lids, although in atropine sensitivity hypertrophy of the conjunctival lymphoid tissue is quite usual. If therapeutic drops such as eserine or pilocarpine are employed over a considerable length of time to combat glaucoma, a drug sensitivity occasionally develops and will necessitate the use of other miotic compounds. A few patients exhibit a violent local reaction to the various anesthetic agents commonly employed to reduce conjunctival and corneal sensitivity. In the event such a drug sensitivity is noted, it is advisable to note the fact in bold letters in some conspicuous place on the patient's clinical record. A common practice among ophthalmologists is to stamp in red ink across the chart the statement "Sensitive to (name of drug)," the blank space being filled in by hand with the name of the offending drug.

Among the most refractory problems common to dermatology and ophthalmology is the treatment of seborrheic blepharoconjunctivitis. The diagnosis is made through the characteristic appearance of the eye lesions. The skin of the lid border is covered with small white, dandruff-like scales. The lid border is red but not ulcerated. Examination of the scalp and external auditory canals reveals an excessive seborrheic secretion. Scrapings from the lid margins reveal the presence of pityrosporum ovale. Seborrheic blepharitis, unlike the type due to chronic staphylococcus or Morax-Axenfeld bacillus infection, will not respond to antibiotics or sulfa drugs used in conjunction with vaccines and mechanical expression of the contents of the Meibomian glands. The seborrhea of the scalp and brows should be brought under control before commencing treatment to the lids and lashes.

Herpes simplex is caused by a filterable virus. The inoculation of the vesicle fluid into the scarified cornea of a rabbit will produce a keratitis, and encephalitis results from succeeding animal transfers.

The eruption may occur on the skin or mucous membranes. It is usually preceded for a few hours by itching, burning, and a sensation of tenseness; later it becomes erythematous and slightly edematous. On this inflammatory base, vesicles develop. These are usually of pinhead size and filled with a serous fluid. After one or two days the contents become cloudy and purulent and the vesicles dry to become serous crusts. The crusts fall off in five to ten days and the residual erythematous macule soon disappears. Regional lymphadenopathy is a rather common finding. In the eye herpes simplex produces irritation, the vesicles rupturing rapidly to leave small abrasions in groups or rows; rarely ulcers are found. The abrasions usually heal promptly without leaving any opacity. The involvement is generally unilateral.

The treatment of the presenting attack is rather simple. If seen in the vesicular stage, drying agents should be used. Spirits of camphor is easily and effectively applied; calamine lotion, lotio alba, and weak solutions of lead are also used. In the crusted stage mild ointments such as boric or weak ammoniated mercury are employed to keep the crusts soft.

The recurrent form will often tax the ingenuity of the clinician. Precipitating factors, if known, should be avoided. Foci of infection should be eradicated. X-rays and ultraviolet light seem to be helpful in some recurrent cases. Vaccine made from the herpes virus is advocated by some authorities but repeated vaccination with the standard vaccine used for smallpox immunization produces equal or better results.

Herpes zoster is a herpetiform eruption occurring along the distribution of one or more of the posterior ganglia or of the cranial nerves. The eruption occurs as grouped vesicles on an erythematous base. It is usually always unilateral. Neuralgic pains may precede the eruption by a day or two and when occurring in the right lower quadrant of the abdomen have been mistaken for appendicitis. This pain may persist long after the eruption has disappeared, especially in the debilitated and the aged.

Scarring is uncommon unless severe pustulation or gangrene has occurred. If the ophthalmic division of the fifth nerve is attacked, herpes zoster ophthalmicus results. If the eyeball is implicated, one finds that the cornea becomes insensitive and presents vesicles which progress to an ulcerative lesion. There may be diffuse deep infiltration with involvement of the iris and the ciliary body. The ocular lesions are treated by moist warm compresses of boric acid or weak solutions of mercury bichloride. Atropine must be employed if the anterior uvea becomes involved.

In treating the skin lesions so many various forms of therapy have been advocated that one wonders if any are of value. Some authorities feel that occlusion is helpful. This may be done by liquid adhesive, collodion, or by thick cotton dressings. Other men feel that soothing lotions such as calamine or zinc lotion are indicated. In the crusted stage, mild ointments such as cold cream or boric ointment are used. For the relief of pain, various injections have been advocated, with equivocal results. These include autohemotherapy, pituitrin, pitressin, thiamin chloride, sodium iodide, and DHE 45. Aspirin, phenacetin, codeine, and other analgesics are necessary for the relief of pain.

Cavernous sinus thrombosis causes dilated facial veins, protrusion of one or both eyeballs, and sometimes papilledema of the corresponding eye and immobility of the eyeball. The skin assumes a dusky-red color of the entire area with the veins standing out in bas-relief. Signs of a furuncular infection (that may have produced the thrombosis) may still be evident on the skin.

Lipoid protienosis is a rare syndrome characterized by yellowish-white plaques on the skin and oral mucous membranes, and an associated warty condition of the skin. The scalp shows a sparse growth of hair and there are bead-like whitish papules on the eyelids and the eyelashes are absent. There is probably an underlying constitutional disturbance, and many of the patients show a diabetic tendency. Treatment with a low carbohydrate diet and insulin will cause a disappearance of most of the lesions of the skin and mucous membranes.

Hydroa is a vesicular and bullous disease that tends to recur each summer during childhood. It is much more common in boys and tends to disappear about the time of puberty. The milder forms which are characterized by papules and small vesicles is referred to as hydroa aestivale while the severe type with bullae, impetiginous crusts and pitted scars is called hydroa vacciniforme. The lesions are most common on the face, dorsal hands, and the extensors of the extremities. Lesions of the cornea will cause scarring and interfere with vision, while the conjunctival lesions resemble those seen in vernal catarrh. Some cases are associated with porphyrinuria which may account for the photosensitization. These cases will show the characteristic wine-colored urine and discolored teeth. The treatment of hydroa is the avoidance of sunlight, use of nicotinic acid, and soothing local applications.

Dermatitis herpetiformis is an uncommon, chronic, relapsing, itching, burning disease which may present ocular complications. The lesions may be erythematous, papulovesicular, vesicular, bullous, or urticarial. They tend to occur at sites of predilection, on the elbows, knees, scapulae, and the sacrum. The ocular lesion implicate the conjunctiva and cornea. The etiology is unknown but is thought strongly to be a virus. The tendency to grouping in this disease is so marked that the diagnosis is hard to establish in its absence. The mucous membranes are not frequently involved and only then when the bullous lesions are predominant. Sulfapyridine seems to control this condition probably better than any other single medication. However, it is not curative and must be continued in small doses for most of the patient's life. Penicillin also appears helpful. Arsenicals by mouth (either acetarsone or in the inorganic form as Fowler's solution or Asiatic pills) seems helpful. Benadryl relieves the pruritus in some cases but has little effect on the course of the lesions.

Reiter's disease is a clinical syndrome consisting of urethritis, arthritis and conjunctivitis; however, skin lesions similar to those of gonorrheal keratoderma are also observed. It is probable that these two diseases are the same except that one is due to a known agent and the other to an unknown organism. The favorite sites of the skin lesions are the palms, soles, elbows and knees, although it may be widespread. The primary lesion is a vesicle and secondary changes of pustules, crusts and keratoses develop. The keratoses appear early as small yellow, waxy cones that grow darker as they become older. The conjunctivitis is usually bilateral and is occasionally accompanied by iritis. Hemorrhages and purpuric lesions of the conjunctiva and mucous membranes, as well as of the skin, may occur. Treatment is not too satisfactory. Penicillin, aureomycin and streptomycin as well as the sulfa drugs have proved disappointing. Hyperpyroxia, either by mechanical means or by intravenous injections of typhoid vaccine, may be tried.

Heerfordt's disease is characterized by iridocyclitis, peripheral facial weakness, recurrent laryngeal nerve disturbances and nodular enlargement of the parotid gland. There may also be the cutaneous lesions of sarcoid. The lesions of the eye and the gland also have the histologic picture of sarcoid. On the skin the lesions are of a dull, yellowish-red or brown color that tend to involute in the center and spread as a raised ring at the periphery but may occur as nodules and plaques. Lesions may also be found in nodes, lungs, bones and other organic tissues. The treatment is largely nutritional through a high caloric, high vitamin diet and injection of crude liver extract. X-rays and ultraviolet to the individual lesions are helpful, and small individual lesions may be destroyed by cryotherapy.

Osler's disease or hereditary hemorrhagic telangiectasia causes recurrent epistaxis with multiple telangiectases of the skin and mucous membranes. The pathologic lesion seems to be small tufts of dilated capillaries scattered superficially over the skin and mucous membranes. The chief symptoms are bleeding from the nose, beginning in early childhood, but may occur in later life, and bleeding from the skin and other mucous membranes following slight trauma. There is no effective treatment.

Behcet's syndrome includes simultaneous or separate episodes of aphthous (herpetic) lesions in the mouth, on the genitalia and ocular symptoms which are usually a chronic recurrent iritis sometimes accompanied by uveitis and neuritis. The disease is more common in men and is probably of virus etiology. No specific therapy is known. There have been no reports but a trial with aureomycin may be indicated.

Acanthosis nigricans is a rather rare condition characterized by hyperpigmentation with papillary hypertrophy. These usually occur at sites of predilection but may be universal. On the skin, the lesions are usually found in the axillae, on the neck, about the arms, umbilicus and on the flexors of the extremities. On the mucous membranes, the conjunctiva, buccal mucosa and palate are most commonly involved; however, pigmentation is usually absent here, and only papillary hypertrophy is noted. About 50 per cent of cases occur in the younger age groups and are associated with some form of endocrine dysfunction; in the remaining 50 per cent that occur in the older age group some form of internal malignancy is present. Mild salicylic acid or resorcin salves will give symptomatic relief on the skin, but the cause should be searched out and treated.

In pediculosis, the crab louse usually restricts its activity to the genital regions but may spread to the axillae, eyebrows and eyelashes. In the course of its migrations there may be bluish or slate-colored macules (maculae caeruleae) which are formed by a secretion the louse forces under the skin while feeding. The diagnosis is made by seeing the louse or the nits attached to the hairs. On the body, the cleanest treatment is dusting with 10 per cent DDT in talc or by a Benzyl benzoate solution. About the eyes, a 2 per cent ammoniated mercury or 1 per cent yellow oxide of mercury is used.

Warts are a virus infection and are found on practically all of the cutaneous surfaces. The filiform type, which is most common on the eyelids and sides of the neck, is easily destroyed by clipping at the skin surface and lightly touching the base with a cautery. The plantar variety usually responds well to x-rays or radium; this form of treatment does not incapacitate the patient and is relatively painless. Elsewhere, cautery is effective.

Lupus erythematosus may be a chronic, less commonly subacute or acute, inflammatory disease characterized by sharply marginated red or violaceous, various sized plaques, situated on the face much more commonly than elsewhere, and followed by cicatricial atrophy. On the mucous membranes the inside of the cheek is usually attacked. The disease first appears as bright red patches, later becoming violaceous, or bluish white, and depressed areas of atrophy with dilated vessels. On the lips and mouth it appears as scaly depressed patches, shallow erosions, or bluish-white depressed atrophic areas. The lip may be slightly swollen and everted. They have been said to look as though they had been covered with collodion and were about to peel.

On the eyelids, the disease appears much as it does on other parts of the skin. On the margins of the lids, the disease superficially resembles blepharitis but the following conditions differentiate lupus erythematosus. The lid margins are dry, not moist, and covered with finely adherent scales. The color is *not* as red and inflammatory appearing as in blepharitis. It may be violaceous. There is no matting of the lids and the cilia may be partially or completely absent. Later the cilia are permanently destroyed, the margins become irregular and atrophic, and the color disappears. Ectropion and eversion of the lid margins are uncommon, as the atrophy is not of a contractile nature. On the conjunctiva, the disease is similar to that seen on the skin except no scales are present. The patches are red to violaceous, edematous, sharply marginated and end in atrophy. The atrophy may take the form of circumscribed depressed areas or as lines and streaks. Isolated lesions of the conjunctiva have not been reported; however, this may be due to the fact that it is not recognized rather than to its extreme rarity. The acute form of lupus erythematosus is a serious, frequently fatal, disease of the collagen tissues of the body and may occasionally show no skin manifestations. There appears to be a severe toxemia and the skin manifestations, when present, show a greater polymorphism than seen with the chronic discoid form of the disease. Fever, malaise, joint pains, and nervous disturbances are common clinical findings while leukopenia and albuminuria are the most consistent laboratory findings. Subacute lupus erythematosus lies between and may show all of the signs of the chronic as well as the acute types. The Libman-Sacks syndrome and acute lupus erythematosus are probably variants of the same disease.

In the acute form of lupus erythematosus, the fundi show marked changes characterized by perivascular hemorrhages, fluffy exudates, and obviously diseased arterioles showing segmentation. These changes occurred in about 40 per cent of one series of cases and occur independently of the hypertension that may develop due to extensive renal damage.

In treating lupus erythematosus, the general health of the patient should be supported and foci of infection should be eradicated. In the acute types, treatment should be of a supportive nature and no active therapy begun until the disease subsides. For the chronic forms, treatment with gold or bismuth salts appears to be beneficial in many cases. The individual lesions on the skin may be destroyed by cryotherapy or cautery. The lupus patient should avoid sunlight, as this not only has a deleterious effect on the acute forms but may cause the chronic type to flare into an acute form of the disease.

Xeroderma pigmentosum is a rare progressive pigmentary and atrophic disease that begins early in childhood. It is due to a congenital hypersusceptibility to ultraviolet light, and several cases in one family are common. Porphyria may be present. There is an early development of senile changes in the skin consisting of lentigines, telangiectasias, keratoses and carcinoma. Photophobia and lacrimation are the early eye symptoms. Later keratitis develops with resulting opacities. Tumors of the lids and cornea also develop. There is no curative treatment. Avoidance of sunlight and the proper treatment of the skin growths as they appear is all that can be offered these patients.

Pemphigus of the eye may occur alone or associated with lesions elsewhere on the skin and mucous membranes. On the eye, the lesions appear as very shallow conjunctival ulcers, usually covered with a tough membrane, and most often seen in the folds. They heal with atrophy and shrinking of the conjunctiva so that eventually the folds become obliterated by scar tissue. The end result is immobility of the globe and cicitricial entropion or even total ankyloblepharon. The cornea is involved indirectly or as the result of trichiasis and becomes vascularized and opaque. On the skin, bullae arise from normal skin on any part of the body. These bullae arise in crops and there may be long periods of comparative freedom. Usually the bullae rupture, leaving a raw, red surface that shows little tendency to heal. As constitutional symptoms increase, the skin lesions tend to decrease so that a patient may die of pemphigus with relatively little to see on the skin. The treatment of pemphigus, on the whole, is very disappointing. Various forms of arsenic therapy have been tried with variable results; sodium naphuride (germanin) has its supporters. General supportive therapy with a high caloric, high vitamin diet and small transfusions at three-day or four-day intervals seem beneficial. If the skin lesions are at all extensive, they are probably best treated as one would a burn of the same severity. The eye complications are also treated more or less symptomatically. If trichiasis results, the lashes should be destroyed, and if symblepharon is extreme, free dissection of the scar tissue and mucous membrane grafts are indicated.

It is well known that opacification of the lens may occur in association with eczema in neurodermatitis of long standing. As a rule, patients with this type of cataract are younger than those suffering from the senile variety, and the history of chronic skin disease is virtually diagnostic of the syndrome. The opacities, as a rule, may be noted in the subcapsular zones of the lens and ultimately progress to the stage of complete opacification. The treatment consists in extraction of the lens and, because of the age of many patients, a linear extraction or Homer-Smith procedure is indicated. The prognosis is favorable. Alleviation or improvement of the skin condition has no appreciable effect upon the ocular lesion.

COMPRESSION FRACTURES OF THE SPINAL COLUMN

JOHN C. IVINS, M.D.
Rochester, Minnesota

THE INCREASING complexity of modern life brings about an ever-increasing incidence of accidents, at work, in the home and on the road, and as the violence of these accidents tends to increase, the treatment of fractures comes to occupy more and more of our time. We see many more "broken backs" than we formerly saw. A "broken back" was an especially common injury during the recent war, and the dreadful connotation of the term itself has been dispelled in part by the lessons learned in treating those injuries.

Fractures of the spinal column may be conveniently divided anatomically into three groups: (1) fractures of the transverse and spinous processes which serve for the attachment of muscles (these frequently are over-treated, to the detriment of the patient); (2) fractures of the vertebral bodies, which transmit weight; and (3) fractures of the laminas, articular processes and pedicles which form the neural arch behind.

In the limited time available, I wish to discuss some important aspects of fractures of the vertebral bodies. Such fractures form the majority of those we see in practice. They result from automobile accidents or falls, usually from some height, and they often occur in certain sports, such as tobogganing; they may occur from trivial injury, such as a fall on a rug, or going over a bump in a car, especially in the aged, who usually have some degree of osteoporosis of the spinal column. They occur not infrequently when a weight falls on the patient's back or shoulders.

In all these instances, the injury usually occurs at the junction of a movable with an immovable portion of the spinal column. The most frequent injury is to the twelfth thoracic and first lumbar vertebrae. Often two adjacent vertebrae are crushed, and at times one sees two injured segments, separated by one or more normal vertebrae.

Most fractures are sustained while the spinal column is in flexion. Extension fractures are rather uncommon, but they probably occur more frequently than we supposed in the past. In many cases, complete paraplegia following an injury in which no bony damage can be demonstrated in the roentgenograms recently has been shown to be due to hyperextension injuries with rupture of the anterior longitudinal ligament and then spontaneous reduction.

Depending on the direction the flexion force takes, the injury may be wedging of one or more vertebrae, comminution of a vertebral body or the more serious fracture-dislocation. As the hyperflexion force is applied, the anterior portion of the body of one vertebra gives way and is crushed by the impact of the vertebra next above or below, the articular facets and pedicles acting as the fulcrum for this force. The angle at which the force is applied seems to determine the extent of the comminution. Impaction of the fragments and the muscle spasm incident to the injury tend to fix the deformity. There is a variable amount of damage to the involved intervertebral disks. Fortunately, the strong anterior common ligament usually remains intact, thus enabling the surgeon to reduce the deformity in these fractures by hyperextension with little danger of doing damage.

After a fall or a hyperflexion injury, the patient may get up and walk, or even return to work, with a compression of one or more segments which cannot be demonstrated by physical examination. Usually, however, the patient will complain of fairly well-localized back pain, with or without radiating pains. The most reliable sign is tenderness over the spine of the broken vertebra, accompanied by a variable amount of muscle spasm. Kyphos may be produced in the presence of more severe injuries. Good anteroposterior and lateral roentgenograms of the spinal column should be made in every case of suspected injury to the spinal column.

The fractures of vertebral bodies under discussion are best shown in the lateral views; when the true status is doubtful, oblique views should also be taken if there is any question of damage to the neural arch or articulation. There is not sufficient time for me to dwell upon the manifestations of damage to the spinal cord or the nerve roots. The cord is so well protected by its fluid bed and covering membranes, and it fits

---

Dr. Ivins is a member of the Section on Orthopedic Surgery, Mayo Clinic, Rochester, Minnesota.

Read at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 9-11, 1949.

so loosely in its bony canal that it escapes injury in the majority of spinal fractures. It goes without saying, however, that every patient who has a suspected fracture of the spinal column should have a neurologic examination. This need not be elaborate. If the patient can move the arms and legs, if there are no gross sensory disturbances, if the deep reflexes are normal and if there is no disturbance of bladder or bowel function, there probably is no appreciable injury to cord or nerve roots.

Proper treatment of these fractures begins when injury to the spinal column is first suspected. The segments of the trunk above and below the site of injury are powerful levers and can be made to inflict more damage if the patient is improperly handled. Nothing is more important to the eventual well-being of the patient than skillfully administered first-aid treatment.

After diagnostic roentgenograms have been made, and a compression fracture of one or more segments has been found, preparations are made to immobilize the spinal column in a position of hyperextension, with or without reduction of the deformity. Some patients cannot tolerate the hyperextension position for many days after the injury, even when the deformity is minimal in the fractured vertebra. In these patients, paralytic ileus is likely to occur. For this reason, we feel it is best to put the patient to bed for a few days on a curved Bradford frame or simply flat on a hard bed before attempting reduction or immobilization in plaster. Morphine should be used sparingly, if at all. If paralytic ileus occurs, it is actively treated with the application of hot stupes to the abdomen, parenteral administration of prostigmine or pitressin, insertion of a rectal tube, withholding of food and fluids by mouth, and the intravenous administration of fluids. If necessary, the patient can be placed flat in bed on a fracture board until normal intestinal activity is restored. An indwelling catheter may be required during the first few days after injury.

When it is certain that the hyperextension position can be tolerated, then it is safe to proceed with reduction and immobilization. With the patient under the influence of analgesia produced by a substantial hypodermic injection of some agent, or with anesthesia when required, the patient is put in position for postural reduction. Generally, the weight of the body will suffice, but gentle pressure with the hand can be exerted. When the full hyperextended position has been reached, a well-moulded plaster is applied; this must extend in front from the suprasternal notch above to the symphysis pubis below.

Immediately after application of the plaster, the patient is turned frequently to avoid pulmonary congestion and to assist in the prevention of ileus. After twenty-four to forty-eight hours the patient is allowed to be up, and then may be discharged to out-patient care.

These fractures are slow in consolidating; the mistake is commonly made of removing the plaster too soon. In any event it seems safe to say that flexion movement must not be allowed earlier than four months after injury. In the case of the comminuted fractures, it may be necessary to continue plaster immobilization for six months or longer.

Throughout this period of immobilization in a plaster jacket, exercises for the spinal and abdominal muscles are practiced regularly. A good system is to teach the patient a regular schedule of doing these exercises so many minutes out of each hour; they cannot be overemphasized. These exercises maintain the tone of the spinal muscles, and if they are properly done the strength of the supporting musculature should be greater at the end of immobilization than it was prior to fracture. Furthermore, such exercises tend to preserve normal flexibility in the spinal column and help in maintaining the patient's confidence in his recovery.

When a sufficient period of immobilization has elapsed, and roentgenograms show satisfactory bony healing, the plaster jacket is discarded. If the exercises have been faithfully done, it should not be necessary, in the average case, to apply a convalescent brace, such as the Taylor brace. However, these fractures commonly occur in people who work hard with their backs, and in such instances an additional period of strengthening exercises may be necessary. For this purpose, regular gymnasium exercises are best; two or three months may be required for this phase of the treatment.

The problem of these flexion fractures of the spinal column extends beyond their recognition, reduction and immobilization. The average period of incapacity after one of these fractures is from six to twelve months, depending on the severity of the injury and the occupation of the patient. However, there are often residual and persistent complaints which extend beyond this period, and these are due to secondary tissue damage.

In unreduced fractures with a residual kyphos there may be considerable static pain caused by poor alignment and strain on the intervertebral articulations. Nonunion of the fragments, which may not be apparent in roentgenograms, is a frequent cause of pain. The intervertebral disk always suffers a variable amount of damage which may lead to narrowing of the interspace, a reduction in the size of the foramina, and perhaps radiculitis. Late posttraumatic necrosis, so-called Kümmell's disease, may occur. Localized hypertrophic spurring probably occurs in the majority of cases, no matter how well the patient is treated, but this alone generally is not the cause of symptoms. The intraspinous and interspinous ligaments, of course, are always injured at the time of fracture, and this injury is perhaps the greatest single factor in the production of persistent pain. Stresses and strains on these injured ligamentous structures manifest themselves by deep-seated pain and tenderness associated with muscle spasm. This may cause the disability to be protracted over a year or more. Encroachment upon the intervertebral foramina in these crushing fractures at the thoracolumbar junction may produce pain which extends along the ilio-inguinal or iliohypogastric nerves.

In a minority of cases, persistent deformity with static pain, continued relaxation of the sustaining ligaments, or reactive spasm of the muscles which will not yield to conservative treatment, may require a fusion operation. Before this is done, the surgeon must be sure that the pain is well localized, that it is aggravated by exertion and that it is completely relieved by rest or the use of a back support.

Many of these injuries have industrial or insurance ramifications, so that the surgeon often will be called upon to evaluate the disability incurred. As far as compensation is concerned, it must be concluded from the foregoing that the period of active treatment varies from six to twelve months and that, on the average, the patient will not be expected to return to work in less than twelve months. Furthermore, there may be late sequelae requiring treatment that will be declared compensable.

A good general rule is to allow 20 per cent total disability if, on final recovery, there is useful strength and motion up to 75 per cent of normal, with relative freedom from muscle spasm and pain. Thirty-five per cent total disability must be allowed if recovery is adjudged to be up to 50 per cent of normal, and finally, about 65 per cent total disability must be allowed if recovery is adjudged to be 25 per cent of normal. Each case must be judged on its own merits, but these are good general points.

"SOCIALIZED MEDICINE AS I SAW IT"

Excerpts from a recent address by Dr. Ralph J. Gampell

Nine years ago I graduated from medical school and began as an intern in a hospital in Great Britain. Four months ago I began as an intern in a hospital here in the U. S. What happened in those intervening years? The Government health scheme of Great Britain. After coming back from five years of service wiith the Medical Branch of the Royal Air Force, I entered a large general practice in an industrial area in Great Britain and that, of course, is the clue as to why I am here. I have worked under this British Government Health Service and found it so objectionable, both personally and as a physician, that I felt compelled to break all my ties—and they are real ties—with home annd friends and professional background and come to start afresh —and from the bottom—in a new country. You see there are some things that are not worth doing at any price and working that sort of government medicine seemed to me so intolerable that I made this momentous personal decision. And I am not alone in making this break. You won't see many of my British colleagues here in the U. S. because the problem of obtaining dollars is almost an insurmountable one for Englishmen. But they are streaming out of Great Britain to the British Dominions. This is hardly the action of men who are happy in the practice of their chosen profession. Believe me, one does not make such a decision readily.

Over here you have been led to believe that the vast majority of British doctors are in favor of this scheme. The figure has been quoted to you that considerably over 90 per cent of them have already joined. The presumption, of course, is that they joined willingly. Nothing can be further from the truth. Let me use my own case as an example. Before the introduction of governmental medicine in July, 1948, England had a system which is little known here in the U. S. When a doctor wished to settle in some area, it was not the usual custom for him to just hang up a shingle. In the normal course of events, he would succeed to the practice of a doctor who had died, or more often, a doctor who had retired, and for the succession he would pay a purchase price usually calculated at 1½ times the annual gross taking of the practice though in particularly favorable areas this could go up to 1¾ or even twice the annual gross. Now these are not small sums of money.

In the practice to which I went—not an especially large one—the annual gross was approximately $8,000. Therefore, it cost me $12,000. Now as you can imagine,

TREATMENT OF DEAFNESS WITH HISTAMINE

G. L. LOOMIS, M.D.
Winona, Minnesota

A PUBLICATION by Hallberg and Horton[1] on the treatment of sudden nerve deafness by intravenous administration of histamine has prompted the writer to attempt a review of sixteen similar cases that he has seen in routine office practice. At the time these cases were treated, no thought was given to the possibility of the review; hence some of these case reports may seem incomplete. However, certain knowledge has been gained from the observation of this group of nerve deafness cases which may help evaluate future patients.

The age group varied from thirty to sixty-seven years. The onset varied from a few days to six months or longer. Not all the patients had pure nerve deafness. After explaining to them that no definite assurance could be given regarding the outcome, I treated eleven patients with nerve deafness, two with conductive deafness, and three with mixed deafness. No otosclerosis cases were included in the survey. Horton[3] stated that while no improvement could be expected except in patients who had had a sudden onset of nerve deafness, there might be an improvement shown in those with a conductive deafness but the chance would be very slight. Hallberg[2] stated that sometimes one can tell beforehand if the patient is going to have a good result. Usually sudden deafness in older people is caused by some vascular accident to one ear; however, once in a while it may be caused by sudden edema, and these people are the ones who should benefit from vasodilating drugs such as histamine. One can never tell in advance which has the hemorrhage and which has the edema. Further observation is still necessary. The following cases are reported as showing the most startling results.

Case Reports

Case 1.—B. J., a man, aged forty, came in on May 9, 1946, complaining of a sudden loss of hearing and a buzzing sound in the left ear, which occurred after riding in a car by an open window. An audiogram (Fig. 1) was taken and showed a marked decrease in hearing in the left ear. Intravenous histamine injection was begun on May 10 and continued for three days using Horton's method[4] of 250 c.c. of 1:250,000 dilution, the duration of the injection usually lasting from one and a half to two hours. The patient noticed such a marked improvement that the injection was discontinued and another audiogram was taken on May 14 (Fig. 1), showing the prompt restoration of hearing which occurred. On February 24, 1947, the patient was re-examined and the hearing was found to be still further improved.

Case 2.—Mrs. L. R., aged thirty-six, was first seen November 11, 1946, complaining of a buzzing noise in the right ear along with a sudden loss of hearing. Examination revealed no disease, but an audiogram (Fig. 2) showed the hearing very markedly reduced in the right ear and normal in the left ear. She was started on histamine intravenously in the same manner as in Case 1. Injections were given on November 12, 13, 14, and 15. An audiogram (Fig. 2) taken November 20 showed the hearing had improved from total loss for speech to only 3.4 per cent loss. The patient has had no more complaints referrable to this condition, and an audiogram taken recently (Fig. 2) shows her hearing the same.

Case 3.—Mr. B. P., aged thirty, was first seen on January 27, 1947, with a history of a buzzing noise in the left ear with sudden loss of hearing. An audiogram taken on this date showed considerable loss of hearing for high tones, with the left ear down in the 60 decibel level for 2896, 4096 and 5792. Intravenous histamine injection was begun on January 28 and given for four consecutive days. An audiogram taken on February 10 showed the patient much improved with the hearing loss for the same three tone levels at 20 decibels. Another hearing test taken on February 10, 1947, showed essentially the same results (Fig. 3).

Case 4.—Mrs. L. S., aged sixty-seven, was first seen on September 2, 1947, complaining of ringing in both ears and sudden loss of hearing in the right ear. She had been wearing a hearing aid for some time. An audiogram showed a marked reduction in hearing on the right ear and a still greater deafness of a very long standing on the left ear (Fig. 4). Intravenous histamine was begun on September 3, and given on four consecutive days, at which time she noticed some improvement. Three months later, having seen two otolaryngologists in Saint Paul, Minnesota, who recommended further treatment, we gave her another course of histamine therapy consisting of eleven consecutive injections. In addition she followed this at home with nicotinic acid, both orally and parenterally. Numerous audiograms were taken shortly after the last injection, and they all showed considerable improvement. The latest (Fig. 4), taken one year after the first treatment, showed the hearing to be very nearly normal for a woman of her age. She has discarded her hearing aid and has an entirely new personality and outlook on life.

Read in part at the December, 1948, meeting of the Minnesota Academy of Ophthalmology and Otolaryngology.

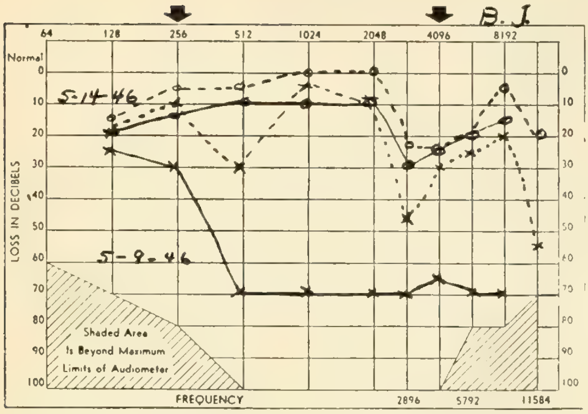

Fig. 1

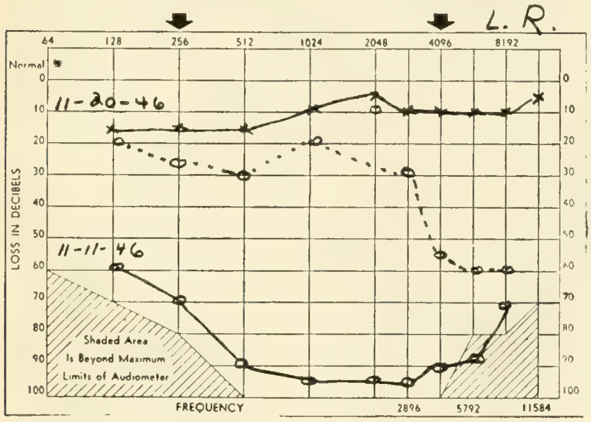

Fig. 2

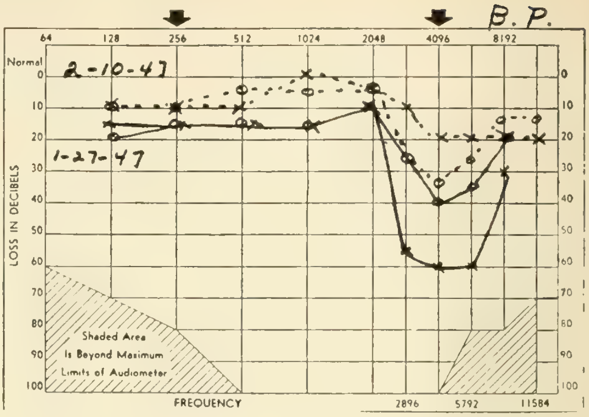

Fig. 3

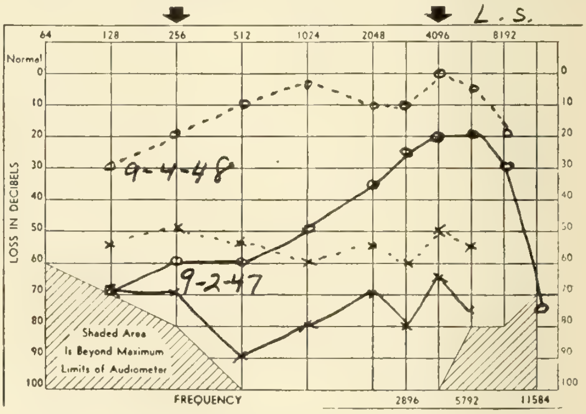

Fig. 4

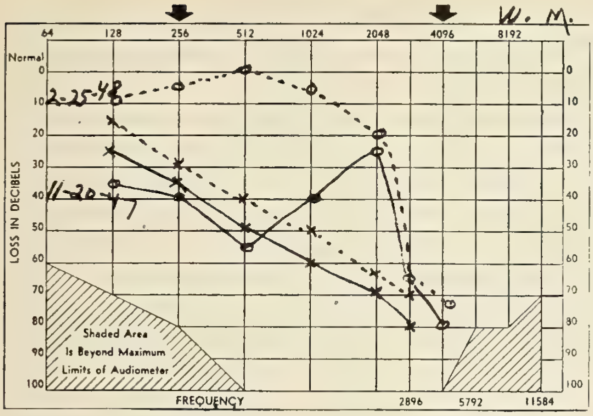
Case 5.—Mr. W. M., aged sixty-seven, was first seen on November 20, 1947, complaining of sudden loss of hearing in the right ear of two days' duration. He also stated that his left ear had had very poor hearing for twenty years. An audiogram (Fig. 5) taken November 20 showed very marked hearing loss in the right ear and considerable loss in the left ear. Histamine injections were begun the same day and repeated on the following three days. He supplemented this treatment with nicotinic acid orally and parenterally. His next audiogram was taken on February 25, 1948, showing the hearing not only improved in the right ear but also registering some improvement in the left ear which had been regarded as totally deaf for the past twenty years.

Case 6.—Mr. E. V., aged forty-eight, was first seen January 7, 1949, complaining of poor hearing in both ears for twenty years, especially the last few weeks. Examination showed a right chronic otitis media nonsuppurative, and a left chronic otitis media mucopurulent. His hearing was reduced to a whispered voice 6 inches right, 2 inches left, spoken voice 3 feet right, 2 feet left, increased bone conduction and a bilateral negative Rinné. He was given nicotinic acid, 50 mg. tablets three times a day. An audiogram taken on January 7, 1949, showed the hearing loss to be 32.5 per cent right, 56.4 per cent left. He returned January 31 and said he could hear better, which was borne out by the audiometer reading showing 30.5 per cent right, 22.1 per cent left. He was given intravenous histamine injections four consecutive days as in the other cases. The hearing on February 14 had improved to whispered voice, right 2 feet, left 2 inches, spoken voice right 8 feet, left 6 feet. The Rinné tests were now plus, minus. A later examination on August 4 showed whispered voice 6 feet each ear, spoken voice 10 feet, with audiometer reading giving 19.7 per cent loss right and 9.9 per cent loss left. The patient states that both he and his family are very much aware of his improved hearing (Fig. 6).

Case 7.—Mr. L. K., aged forty-nine, was first seen on February 8, 1949, complaining of a hearing loss for about three days, but further questioning showed that for several years he had known that his hearing was not normal. Examination showed a nerve deafness, hearing whispered voice right 1 foot, left 2 inches poorly; spoken voice right 4 feet, left 2 feet. He was given three intravenous injections of histamine on February 10, 11, and 12 and nicotinic acid, 50 mg. by mouth. An audiogram taken February 15 showed a marked improvement, namely, 30.9 per cent right and 14.8 per cent left. Rinné test showed positive each ear, whispered voice right 1 foot,



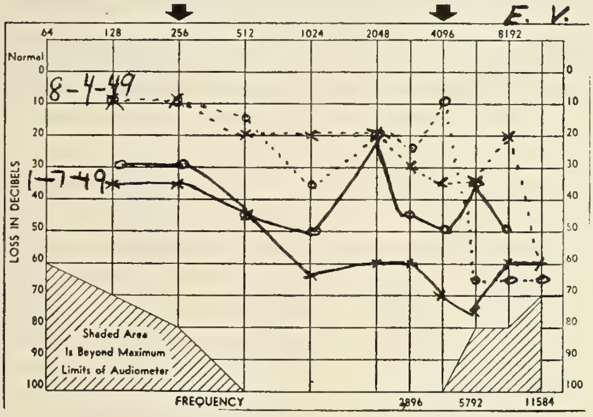


Fig. 5
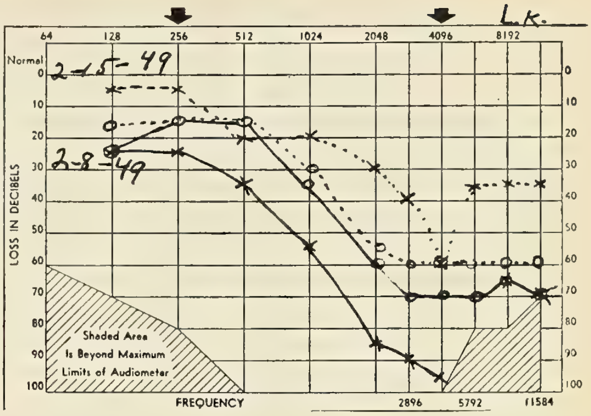
Fig. 6



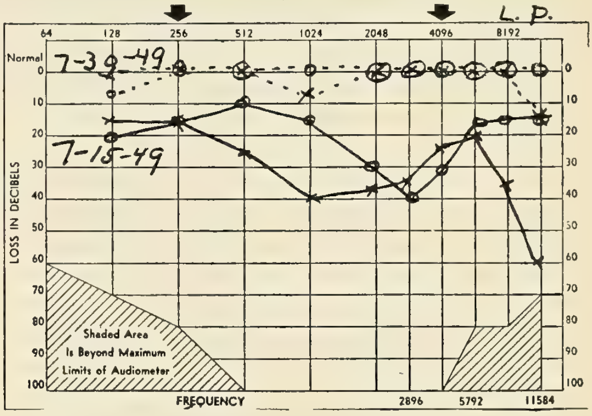


Fig. 7
Fig. 8

left 2 inches, spoken voice right 25 feet, left 25 feet. A recent audiometer reading taken on August 29 showed essentially the same result (Fig. 7).

Case 8.—Mr. L. P., aged thirty-nine, was seen July 15, 1949, complaining of a sudden onset of a buzzing-like tinnitus in the left ear for one day. This was accompanied by a severe attack of vertigo at the same time. There was a slight feeling of nausea but no vomiting. He also stated that he had noticed a lesser buzzing sound off and on for short periods for several years. He used to hear a pulse-like beat but not since the present attack occurred. A comparison of audiograms taken on July 15 and July 30 is interesting, showing a quick return to normal following four histamine injections as in the previous cases. Symptomatically he was improved after two injections (Fig. 8).

To be absolutely impartial, those cases which showed little or no improvement should be included in this report. There were five patients who showed no appreciable increase in hearing. Three of these cases of deafness had resulted from exposure to shell fire while in the military service. It had been explained to all of these that improvement might be questionable. There were three patients who showed a slight improvement. By more careful choosing of these cases and limiting them to those having primarily nerve type deafness, rather than including the conductive deafness, the percentage would look better. However, those of the other group who were improved are happy about the regained hearing and seem better adjusted socially. In addition, nearly all patients noticed an appreciable improvement in their general condition and well-being which was not just a transient change.

An explanation of the rationale of this form of therapy goes beyond the realm of this paper. For an interesting concept on vascular and fluid changes taking place through middle and inner ear dysfunction, reference should be made to an article published by S. H. Mygind[4] of Copenhagen.

Summary and Conclusions

Sixteen cases of deafness are presented as a series of cases to illustrate the relationship between intravenous histamine injections and im-

(*Continued on Page 212*)

TUBERCULOSIS OF THE UTERUS

Report of Three Cases

WILLIAM P. MULVANEY, M.D.
Saint Paul, Minnesota

THE PURPOSE of this paper is to present three cases of uterine tuberculosis, demonstrating the different symptom complexes which existed, and to illustrate the methods of treatment available for this disease.

Tuberculosis limited to the female genital tract is uncommon. It is usually associated with a peritonitis of acid-fast origin.[4] The tubes are most frequently affected, while infection of the uterus and the cervix is more rare. Etiology of genital tuberculosis is generally considered to be by hematogenous dissemination, although conjugal inoculation has been implicated unconvincingly in European literature.[3] The presently prevailing opinion holds that infection is descending and originates outside the genital tract. The low incidence of tuberculous infection of the uterus, even in the presence of tubal infection, may be due to the monthly replacement of the endometrium before invasion by the bacilli can take place. Cases of uterine tuberculosis available for study significantly are associated with oligomenorrhea and amenorrhea. When ovarian function fails, endometrial replacement is inhibited, and tuberculous infection from the tubes is more likely. Menorrhagia may then occur with deeply penetrating endometrial and myometrial lesions.

The diagnosis of genital tuberculosis is usually made by biopsy, curettage, operation or autopsy. Available treatment includes the use of tuberculin, pneumoperitoneum,[6] irradiation, streptomycin and surgery. The first two methods have been given very little clinical trial. Until recently, surgery and irradiation used separately or in conjunction have been considered the best treatment for this disease. The value of surgery is established. X-ray therapy is said to stimulate production of fibroblasts and promote healing. It tends to prevent recurrence and to clear up residual granulation.[2,5]

The usefulness of streptomycin in pelvic tuberculosis awaits evaluation, as very few cases are being reported. It is of known value in aiding healing of tuberculous sinuses and fistulas. It may also be of value in preventing dissemination of tuberculosis after operation. The surgical mortality in toxic tuberculous patients is approximately twice that in nontoxic patients.[7] Streptomycin may prove useful in preparing a patient with genital tuberculosis for operation by reducing the toxemia. Aronson and Dwight[1] have reported an apparent cure of endometrial tuberculosis in a young woman, using streptomycin alone. They gave 1 gram daily for 129 days.

Case 1.—A twenty-eight-year-old Filipino came to the clinic because of vaginal bleeding of ten days' duration and slight suprapubic pain. Periods had been regular, lasting seven days monthly. There had been no pregnancies since the death of her three children during the Japanese occupation. They had died within six months of each other at the ages of four years, two years, and 5 months of "bronchitis." Physical examination limited pathology to the pelvis. The uterus was asymmetrically enlarged to the size of a ten weeks' pregnancy and was firm in consistency. The cervix was eroded and polyps were present. The urine, a hemogram, a Friedman test, and a roentgenogram of the chest showed nothing abnormal. The polyps were removed, the uterus curetted and a cervical biopsy taken. The three specimens contained numerous foci of giant cells, caseation necrosis, epithelioid cells and lymphocytes arranged in tubercle formations. Tubercle bacilli were identified after staining.

The patient refused admission until pain recurred. Pain returned in the left flank, and the urine was loaded with erythrocytes. An intravenous pyelogram located an acutely kinked and dilated ureter and left hydronephrosis. Bed rest alleviated the pain, and the urine cleared. Urine cultures and guinea pig inoculations were negative. Since the curettage there had been three episodes of scant vaginal bleeding lasting four days. Pelvic findings were essentially the same, except for the cervicitis which had become more severe. Observations showed a daily fever of 101°. Repeated sedimentation rates were about 45 mm. The hemogram: red blood cells, 4,100,000; white cells, 6000; polymorphonuclear cells, 57; lymphocytes, 33; eosinophiles, 10; platelets, 170,000. The hematocrit was 36. Blood urea nitrogen and creatinine were normal. A roentgenogram of the chest was unchanged. The stools contained the ova of hookworm and endameba hystolytica, as did those of nearly every patient in the hospital. In the light of past experience, the latter were discounted as contributing much to the patient's toxicity. The patient appeared well nourished and in apparent good health. Search for foci of extragenital tuberculosis was unsuccessful. The urinary tract was suspected but culture of twenty-four-hour urine specimens were negative.

One gram of streptomycin was given daily. After five weeks the temperature had dropped to normal and

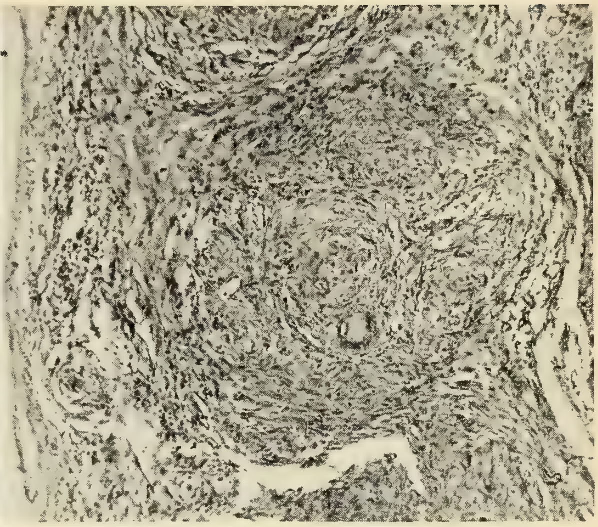

Fig. 2. *Case 1.* Myometrium near serosal surface.

the sedimentation rate leveled at 5 mm. There was a 5-pound weight gain, but the cervicitis and uterine enlargement remained. At laparotomy, a bilateral salpingo-oophorectomy and panhysterectomy was done removing a cuff of thickened vaginal tissue. Several "rice grain" nodules were noted under the serosa of the cecum. The remaining abdominal organs appeared uninvolved. The postoperative course was uneventful and the highest temperature was 99°. Streptomycin was continued. Irradiation therapy facilities were unavailable. Three weeks postoperatively the patient left the hospital against advice of the staff and refused to take streptomycin as an out-patient. She returned in two months with hematuria and left lumbar pain, which again subsided without definitive treatment. Urine inoculations of guinea pigs were reported positive for tuberculosis. The patient refused therapy but was seen four months later. There were no complaints. She looked well and had continued to gain weight.

Examination of the organs excised showed generalized tuberculosis. The uterus contained tubercles in the endometrium and serosa. The myometrium was only slightly involved. Tubercles were present in the muscularis of the cervix, and the submucosa was infiltrated with lymphocytes. The blood vessels of the adnexa were surrounded by tubercles and caseating areas. The tubes bulged with fibrocaseous and fibrocalcific lesions, and the epithelium was almost completely destroyed. The ovaries contained numerous fibrocaseous areas. The process in the uterus seemed to be more productive than that in the tubes and ovaries where there was more necrosis.

Case 2.—A forty-two-year-old American woman in seemingly good health sought treatment for a severe aching lower abdominal pain of three months' duration. The pain had gradually increased and had become disabling. Five years previously she had bled copiously and was curetted. She was told she had fibroids and was too ill for operation. Radium therapy of unknown quantity was given. Thereafter her menses were scant in amount and lasted three days. For the past ten months there had been no bleeding but pain was noted at the time of expected menses.

Past history revealed only that her last illness had been childhood measles. There had been no pregnancies. Complete examination including a roentgenogram of the chest failed to show evidence of disease outside the pelvis. The uterus was symmetrical and the size of a three months' pregnancy. It was resilient but firm. Tubes and ovaries were not considered notable. The cervix was fibrotic and the os stenosed by scar tissue. A probe could not be passed. The diagnosis of cervical stenosis secondary to radium therapy and hematometra was made and laparotomy performed. The uterus was enlarged, and the left tube was fibrosed, firm and partially calcified. The possibility of tuberculosis was suspected and a panhysterectomy and bilateral salpingo-oophorectomy done. Radiation therapy was given along with one gram of streptomycin daily. Healing of the wound was complete, and the patient recovered without incident. Streptomycin therapy was continued for sixty days. The pathologist's diagnosis was tuberculous pyometra and healed tuberculosis of the tubes.

Case 3.—A thirty-six-year-old American woman was examined in an attempt to determine a cause for her sterility. There had been no pregnancy in seven years of marriage. The patient's past history was not remarkable except for a "pneumonia" at the age of twenty-three with hospitalization for three weeks. She had been examined and given roentgenograms of the chest at yearly intervals since then without evidence of disease. Menarche was at thirteen. Periods lasted five days and arrived at regular twenty-nine-day intervels. For the past six years, however, the menses had become shorter and scantier. There was slight primary dysmenorrhea. Physical examination and endocrine survey gave no hint as to the trouble. Pelvic examination showed nothing of note. The husband was given a urological survey and was found not to be at fault. An endometrial biopsy was taken to determine the presence of ovulation. Tuberculous endometritis was found upon microscopic examination. No other tuberculous process could be found, nor was the patient toxic. A panhysterectomy was done and both tubes and ovaries removed. X-ray therapy was given. Streptomycin was not available. Two years later, the patient had remained asymptomatic.

The pathologist's diagnosis was tuberculous endometritis and healed, calcified tuberculous salpingitis.

Comment

Radical operations were done in each case. X-ray therapy was used as a postoperative adjunct to treatment when possible. Streptomycin was used in two cases. In the first patient toxicity was reduced by streptomycin therapy, enabling the patient to undergo operation at a reduced risk.

The three patients recovered from their operations promptly and without complication. Wound healing was complete and without sinus formation.

Further clinical trial of streptomycin treatment of genital tuberculosis may be warranted when the patient is young and a salvage of the reproductive capacity is indicated. However, since tuberculous endometritis is seldom unaccompanied by tuberculous salpingitis, it is doubtful if fertility can be restored.

When tuberculosis is limited to the genital organs by careful clinical investigation, radical surgery offers the patient the best chance for a cure. It has the advantage of eliminating diseased organs from an otherwise normal body. This principle has been used with success in other fields of surgery for tuberculosis. Streptomycin and X-ray therapy constitute valuable adjuncts to treatment.

Summary

The etiology and diagnosis of uterine tuberculosis are briefly mentioned and the available methods of treatment outlined. Three illustrative cases are reported which were treated by operation aided by streptomycin and x-ray when available. No operative or postoperative complications were encountered. Surgical removal of the diseased organs in an otherwise normal patient is the treatment of choice. X-ray and streptomycin therapy are valuable adjuncts to surgery.

"SOCIALIZED MEDICINE AS I SAW IT"

(Continued from Page 156)

after serving five years with the RAF I had no $12,000, I borrowed the purchase price from the bank. The coming of the National Health Service Act—a vast system of government medicine—made this long-established practice of buying and selling illegal. But it should be said in fairness that the doctors were not to be robbed of their practice value. A sum of some 264 million dollars was appropriated as compensation. Provided, and this is the vital proviso, provided that the doctor claiming compensation had entered the nationalized medical scheme on or before July 5, 1948, he would be reimbursed. It will be clear to you that in my personal case I stood to lose no less than $12,000—not even my own at that—should the scheme come into operation on the appointed day and my head not be there to be counted. And that story applies to almost every doctor in Great Britain. As the government claims, the doctors in Britain are 99 44/100 per cent pure.

As a general practitioner, I had registered with me, because of course in socialized medicine, we must have registrations; I had registered with me some 3,200 souls and this, believe it or not, was not the maximum. I could have had 4,000 and even more in certain exceptional circumstances. I challenge any of you listening to me to have even a conception of what is entailed in being responsible for the health of that number of people.

In America there is one doctor for substantially less than a thousand persons. I used to do three one-hour office periods each day. And I could expect twenty people and more in one of these periods; that is an average of three minutes per patient. And I have made as many as thirty-six house calls in one working day in addition to my work in the office. You will, I am sure, appreciate what sort of medicine this is.

It is just what you would have expected. The illusion of "all for free" has taken firm hold and the national hypochondriasis has reached truly alarming proportions. The doctors' offices are crowded to overflowing and the urgent sick are forced to wait their turn while the doctor's time is devoted to the mass of unnecessary demand on his professional skill. This impossible strain has meant inevitably that any case requiring more than the barest minimum of attention has to be got rid of as quickly as possible and this is done by referring the unfortunate patient to the nearest hospital, not because of any necessity for hospital facilities, but because what is needed is that thing which is in the shortest supply—the doctor's time.

The government's original estimate for the first year's operation was that they would need all the sum realized by the payroll withholding tax as well as an extra 520 million dollars from the general appropriation. At the end of the first nine months, however, an extra appropriation of some 230 million dollars was needed to prime the pump—an elegant commentary on the accuracy of the political planners. And, of course, this "free for all" assembly-line medicine requires an ever-increasing, snowballing expenditure. As long as he is in possession of the right form, there is virtually nothing that the energetic patient cannot obtain—drugs, dentures, toupees, surgical corsets, elastic hose, spectacles, hearing aids, all to be had for the asking, and how they do ask. Before I left England I could regard myself

(Continued on Page 185)

CLINICAL-PATHOLOGICAL CONFERENCE

DIAGNOSTIC CASE STUDY

ARTHUR H. WELLS, M.D., HAROLD H. JOFFE, M.D. and THOMAS MOE, M.D.
Duluth, Minnesota

DR. J. E. EGDAHL: This fifty-three-year-old white lumberjack (Case A. 4516) had apparently been in good health until eight days before his death, when he developed gradually increasing nausea, vomiting and marked weakness. After two days of illness he was hospitalized with disorientation, restlessness, weakness and slight jaundice. His temperature was normal or subnormal. His white blood cell count was 7,500 with a normal distribution of the white blood cells. He was given penicillin and 10 per cent dextrose in saline. There was some tenderness over the liver area but no enlargement of the liver. The jaundice rapidly increased in severity and his disorientation progressed into a stupor and after forty-eight hours in the hospital he passed into coma. His eyes were open most of the time and there appeared to be a loss of the blinking reflex. There was frequent yawning and he appeared to be regaining consciousness much of the time until the last twenty-four hours. At no time did the physical examination reveal any additional evidence of an explanation for this rapid progression of a disease process. His pulse was good. The highest pulse rate was 116 per minute. There were no cardiac murmurs. The lungs were clear and the abdomen was relaxed and not distended. He expired on the sixth hospital day and the eighth day of apparent illness without regaining consciousness. There was no response to the antibiotic therapy and only a terminal rise of his temperature above normal.

The past history revealed that the patient had injured his forearm in a saw two months preceding the apparent onset of his present illness. The extensive laceration extended down to the radius and ulna, severing practically all the tendons on the palmar aspect of the forearm. The wound was cleaned and closed at another small hospital. Penicillin, tetanus antiserum, and a unit of "Red Cross Plasma" were given. He was released from the hospital as improved after ten days. The wound healed after approximately one month. There was no return of sensations or ability to flex the fingers or hand.

Additional history revealed the continuous use of alcohol in excess over a long period of years.

DR. A. H. WELLS: The case is now open for diagnoses.

Physicians: Infectious hepatitis, acute catarrhal jaundice, acute homologous serum hepatitis, acute yellow atrophy of the liver, cancer of the pancreas or biliary tract.

DR. A. H. WELLS: What were the features which led you to the proper diagnosis, Dr. Urberg?

DR. S. E. URBERG: Sixty days after having received pooled plasma this man developed a rapidly increasing jaundice, disorientation and weakness progressing to coma and death within a very short period of time. The diagnosis is homologous serum hepatitis until proved otherwise.

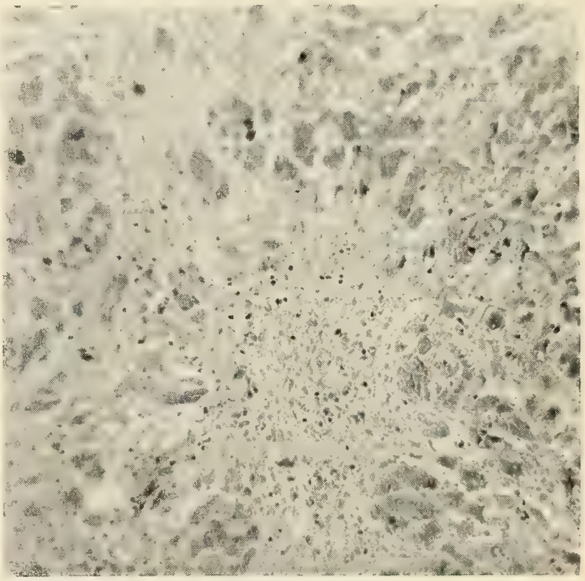

Fig. 1. Phosphotungstic acid and hemotoxylin stain revealing cellular debris and absorption in central zone, extreme liver cell degenerative changes and inspissated bile in canaliculi.

Necropsy

The postmortem examination of this fifty-three-year-old well nourished, embalmed, white male was essentially negative except for the fatal acute hepatitis and associated toxic changes in no other organs. The 820 gram liver was uniformly shrunken to approximately 50 per cent its usual size. There was a dirty grayish green color of outer and cut surfaces with accentuation of the contracted architectural markings.

Histologically two-thirds of the liver cells were represented by granular cellular debris located primarily in central zone areas. The remainder of the parenchymal cells were pale, swollen and had ill-defined nuclei and cell walls. These possibly viable cells were arranged in small groups and located in the periphery of liver lobules (Fig. 1). Bits of inspissated bile was found

---

From the Department of Pathology and Graduate Educational Service, St. Luke's Hospital, Duluth, Minnesota.

in canaliculi and in the cellular debris. There was a moderately severe patchy neutrophilic infiltration of irregular distribution.

Toxic changes of mild grade were demonstrated in the myocardium, spleen and kidneys. There were no cerebral lesions.

Nomenclature Orientation

There is no general agreement on terminology.[24,28,29] It seems likely that the terms acute catarrhal jaundice and epidemic catarrhal jaundice will disappear from the medical literature to be replaced by such terms as infectious hepatitis, homologous serum hepatitis or virus I.H. hepatitis and virus S.H. hepatitis. The term acute yellow atrophy may also eventually suffer the same fate of oblivion or be used simply to designate an extensive necrosis of liver of unknown etiology. Hepatitis resulting from chemicals such as cinchophen, carbon tetrachloride, chloroform, mushroom toxin, phosphorous, arsenic compounds or caused by known bacteria should be specifically designated as to cause.

Virus Hepatitis

Since there are no known susceptible lower animals or satisfactory culture media for the virus involved in virus hepatitis our knowledge is based upon clinical observations and experimental work with inoculated human beings.[16] The present consensus is that the disease can be divided into two types, each of which will produce a permanent immunity against itself but apparently not against the other. One is a natural occurring disease in either sporadic or epidemic forms and is termed "infectious hepatitis." The other "homologous serum hepatitis" is propagated by mistakes in which the contaminated serum or blood of a carrier or diseased person is introduced into a susceptible individual by the use of contaminated needles, blood and serum transfusions, vaccines, arsphenamine injections and even by simple accident with a hypodermic syringe.[13]

Infectious hepatitis is the fairly common and widespread condition formerly known as acute catarrhal jaundice. It is a disease primarily spread by fecal contamination of food and drink. Since the virus occurs normally in the blood stream, transmission by transfusion is also frequent. In the Mediterranean area alone it caused tens-of-thousands of cases of hepatitis in the United States Army troups, involving as many as 50 per cent of a single command.[7] In spite of the low mortality of approximately 0.2 per cent it was one of the principal medical causes of death among our troups and the greatest cause of disability.

Prior to World War II, homologous serum hepatitis was little understood by physicians of this country. The potential danger of any transfusion has been more recently emphasized.[2,3,9,19,21] The incidence is as high as 11 in 2,443 transfusions of blood and serum[19] or 29 times in 649 patients receiving dried pooled plasma.[2] In a general hospital among 936 transfused patients there were 20 who developed "possible hepatitis" and 12 with "probable hepatitis."[15] The disease is an important problem in the conduct of a blood bank.[15,19] Although the morbidity of homologous serum hepatitis is approximately that of infectious hepatitis, its mortality has been found to vary from 0.2 per cent to as high as 41 per cent[12] in smaller group studies.

One of the principal differences in the two forms of virus hepatitis is the 18 to 40 days incubation period for infectious hepatitis and 60 to 120 days for serum hepatitis.[17] Dilution, prolonged freezing and dehydration apparently do not decrease infectability. Alcoholism, serious injuries and malnutrition[23] accentuate the diseases. Ultraviolet radiation of the serum,[1,28] gamma globulin prophylactic therapy[24] and immunization by previous infection protect against the diseases.[25]

Pathology

The entire histogenesis of virus hepatitis[3,5,10,20,22,29] has been revealed by numerous liver biopsies and postmortem studies. There appears to be no essential difference in the two types. Early and mild changes consist of monocytic, neutrophilic and eosinophilic infiltration of periportal areas, swelling and pallor of liver cells particularly in the central zone. Progression of the disease results in necrosis of parenchymal cells, first in the central zone and if severe, large groups of liver lobules may be destroyed leaving the stroma untouched. In this stage there may be inspissated bile in the canaliculi but not in bile ducts. There is a rapid absorption of necrotic tissue. Healing generally results in a complete replacement of liver lobules by regeneration of the remaining liver cells.[14] Several authorities[5,10,11,20,26] have observed progression of the process into a form of cirrhosis of the liver. The latter may be similar to or identical with the so-called "toxic cirrhosis" of Mallory in which there are large areas of stromal elements representing the skeletons of many liver lobules and not an accumulation of scar tissue.

Concurrent lesions in other organs have been described such as, meningoencephalitis, acute regional lymphnode inflammation, orchitis, acute splenitis, myocarditis and interstitial pneumonitis.[21,29]

Clinical Manifestations

The different outbreaks of virus hepatitis reveal a close clinical interrelationship of the diseases of the two or more icterogenic agents. A history of other cases of the disease in the family or neighborhood or recent hypodermic injections may be useful. Following the variably long incubation periods there is described[58] a prodromal or preicteric stage with tender liver enlargement, hyperbilirubinemia, bilirubinuria and leukopenia. The acute stage is frequently precipitus in the onset of its characteristic signs and symptoms. In one large series[8] the frequency of observation of signs and symptoms were as follows. malaise 100 per cent, nausea and vomiting 100 per cent, anorexia 100 per cent, dark urine 100 per cent, abdominal discomfort 95 per cent, jaundice 78 per cent, light stools 71 per cent, fever 64 per cent, palpable liver 57 per cent, constipation 57 per cent, generalized aches and pains 35 per cent, pruritus 7 per cent, rash 7 per cent and diarrhea 7 per cent. Lassitude, chilly sensations, bloating, arthralgia, and myalgia are nearly always present. The clinical picture frequently does not reflect the severity of liver damage in the acute phase. The temperature is generally elevated in infectious hepatitis but is frequently normal in homologous serum disease. After continuous persistence or apparent recurrence for from four to six months the disease is generally considered chronic. Ease of fatigue, mental depression and aching, soreness, fullness, heaviness or pain over the liver are the usual chronic manifestations. Rarely the development of cirrohisis and its clinical signs are described as sequelae.

Laboratory studies may reveal a normal total white blood cell count with a mild lymphocytosis. The icterus index is generally elevated at some time during the disease, however isolated total serum bilirubin tests revealed high levels in only 83.8 per cent of 93 cases.[12] The cephalin flocculation, cholesterol esters, galactose tolerance and the bromsulphalein excretion (with normal serum bilirubin) have all been found to be of aid in identifying diffuse liver cell injury and were helpful in following the progress of the disease.[3,12,18,21] Punch biopsy of the liver is by far the most accurate diagnostic aid.

The diseases to consider in a differential study are: the causes of mechanical obstruction of the common duct, virus pneumonia, infectious mononucleosis, acute brucellosis, amebiasis, malaria and the chemical hepatotoxins mentioned above.

Treatment

To date no antibiotic has been reported as specific for virus hepatitis. Gamma globulin has been found protective if used prophylactically.[24] Adequate rest has been stressed by all authorities.[16] One interpretation of this is complete bed rest until the serum bilirubin falls to 1.0 mgs. per 100 c.c. or until jaundice has cleared.[12] Graduated activities may be permitted with disappearance of liver tenderness and a return of liver function tests to normal. With a recurrence of these signs complete bed rest must be reinstituted because of the possibilities of serious injury to the liver.

A nutritious diet with high carbohydrate and protein and a low fat content is advised.[8] Methiomine and vitamins are advised. Liver toxins including alcohol are contraindicated.

Summary

A fifty-three-year-old chronic alcoholic developed homologous serum hepatitis and expired sixty-eight days after receiving pooled plasma. The necropsy findings and an incomplete literature review of virus hepatitis are given.

The early diagnosis of tubercle remains one of the major problems of general practice. The standard of what constitutes early diagnosis has been considerably altered. In the days before the general use of chest radiography one had to depend upon the finding of abnormal physical signs in the chest or on the presence of the bacilli in the sputum—a stage nowadays considered too late. In theory, of course, early diagnosis is quite easy. The chest is x-rayed and the problem is solved. But in actual practice things can work out very differently. The early signs are so slight, so varied, so indeterminate, that unless a doctor is tubercle-conscious an x-ray may not be called for and precious time is wasted. —R. J. Perring, M.D., *Lancet,* December, 1949.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from the January issue)

It is remembered by some of the early junior physicians, who long have been senior members of the permanent staff, that they came, as they recall their viewpoint, "to work with the Drs. Mayo"; they did not think of the firm and its facilities as a clinic. It has been noted in newspapers of that period that when a new worker, physician or not, joined the group, he "entered the employ of the Drs. Mayo." As late as 1912, when a reception was given for Sir Bertrand Dawson, of England, it was held at the "Mayo Library."

It was in 1912, when the staff included a growing group of junior physicians and surgeons, that it seemed proper to choose a suitable and dignified title for them, and Dr. E. H. Beckman, it was said, suggested "fellows." "Fellows of Mayo, Graham, Plummer and Judd" was unthinkable, "Fellows of St. Mary's Hospital Mayo Clinic," was unwieldy, and a second suggestion, "Fellows of the Mayo Clinic," was adopted. This decision, it is believed, inaugurated the use of the name "Mayo Clinic" by the group concerned, although, informally and among themselves, the staff earlier had begun to speak of "the clinic."

In 1912, also, when the offices had become congested and to some extent decentralized, it was decided that an adequate new building, designed for clinical work, must be erected, and on October 12, 1912, the cornerstone was laid. As the *Democrat* announced, it was the intention of the firm of Drs. Mayo, Graham, Plummer and Judd (Dr. Stinchfield retired from active practice in 1906) to build a large structure, to cost $100,000, for their clinical and diagnostic offices. The building was constructed on the site of Dr. W. W. Mayo's first Rochester home, which had been built in 1863. Although the Mayos and their associates, their offices and their work long had constituted a clinic, it was not until the new building was opened on March 6, 1914, housing under one roof all clinical facilities, including extensive laboratories, that the Mayo Clinic emerged into public recognition as such. In 1914, for the first time, the firm used "Mayo Clinic" on their letterheads, above "Drs. Mayo, Graham, Plummer and Judd," and then only after hesitation on the part of the Drs. Mayo, lest the title should seem ostentatious.

On October 8, 1919, when Dr. W. J. Mayo and Dr. C. H. Mayo founded the Mayo Properties Association (beginning in 1947, Mayo Association), they said, in reviewing the history of the clinic and its name. ". . . . the donors and their associates have adopted, as their copartnership name, the name which has thus been bestowed upon them." A few years later the copartnership for medical practice became a co-operative association for medical practice.

Even as the private practice was becoming a private group practice, better care of the sick and better education of physicians, in science and the humanities, became to Dr. William J. Mayo and his brother a motivating purpose. The achievement of the Drs. Mayo and their associates in care of the sick and in medical education has been and is a work of continuing growth and evolution.

Conditions of Practice at the Close of the Century

The advances in the art and science of medicine and surgery that were made in the last twenty years of the nineteenth century have been reviewed often by able historians. In Olmsted County, in that period, remarkable progress was made by private practitioners in the acquisition and application of the new knowledge. The county program of public health and public welfare was improved continuously and was carried out in co-operation with the Minnesota State Board of Health and Vital Statistics, of which at various times some representative physician of the county was a member. The physicians of Olmsted County maintained fraternal accord with one another and with their confreres elsewhere. By the close of the century annoyance by unethical and irregular practitioners of medicine had become minimal. The Olmsted County Medical Society, which long had been functioning actively, was in excellent standing as part of the Minnesota State Medical Society, and it had creditable representation in the American Medical Association.

Biographical Sketches*

It is evident that in the evolution of medical practice in Olmsted County the influences that combat prejudice and make for liberalism and progress steadily gained in strength. Most members of the regular profession remained faithful to the tenets of their school. Many homeopaths ultimately embraced the regular school, as did many eclectic practitioners. All had their part in bringing about improvement. There were practitioners, of all types, who changed occupation for reason of loss of health or of greater interest or profit in other occupations. Others, because of lack of means or inclination to meet improving professional standards, as stringency of medical legislation increased, dropped out of the profession.

There follows what may seem to be an undue amount of biographical material. It is given, especially about some of the earliest physicians and about some who were longest resident in the county, because, as an outstanding historian has said, the personal element in biography makes for appreciation of truth. Notes are given here on all physicians of established schools in the county about whom information has been obtainable. Considerable detail is used, for such value as the record may have in the history of medicine in the state, regarding practitioners who, although they were in Olmsted County only a short time, at some period practiced elsewhere in Minnesota. Sketches appear of a few practitioners of the county who were not recognized physicans, for example, magnetic healers, cancer doctors, herb doctors, and so forth; in these, care has been taken to state plainly the avowed methods of practice. These practitioners are included with representatives of established schools because they were a well-known part of the medical scene and contributed to medical history of the county.

Arthur Strong Adams, a graduate physician and surgeon aged thirty-five years, arrived in Rochester, Minnesota, from Cleveland, Ohio, on March 18, 1885, accompanied by his wife, Emma J. Ford Adams, to whom he had been married in Cleveland two days previously.

---

*Although this article deals essentially with the years before 1900, the biographical sketches, whenever possible, cover the lifetimes of the subjects. When inquiry has been infeasible, or when it has not met with response, a résumé of data, believed to be authentic, has been used.

Grateful acknowledgment is made here to the innumerable persons—relatives, friends and patients of the early physicians; editors, writers, librarians, physicians, county officers and other workers—who have given generous help, and to many others who have expressed encouraging interest in the compilation of the record.

A son of William H. Adams and Octa B. Strong Adams, pioneer settlers of Ohio, Arthur Strong Adams was born in Sheffield, Lorain County, Ohio, on February 10, 1850. A few years later the family moved to Delaware County, Ohio, where Arthur Adams received his academic education in the public schools and at Ohio Wesleyan University. He next read medicine with an established practitioner, and in 1876 (sometimes given 1875) was graduated with the degree of doctor of medicine from the medical department of Wooster University.[†] He entered practice in Cleveland, and during two of the ensuing nine years was assistant physician on the city board of health.

Dr. Adams came to Olmsted County with two declared purposes: to regain his health and to specialize in major surgery. He early recovered his health. In the thirty-four years of his residence in Rochester his professional work, however, was mainly general practice, with emphasis on nervous and mental diseases and for a time on public health work.

On June 30, 1885, Dr. Adams received Minnesota state medical license No. 1074 (R). His first professional card, in 1885, stated he specialized in mechanical surgery and that he was an expert in the use of electricity. The press added that Dr. Adams already was treating several chronic cases of catarrh with electricity and that if he could cure catarrh by that treatment he had struck a bonanza. Dr. Adams' acquaintances have said that he "was always dabbling with electricity, electrodes, therapeutic appliances." He gave galvanic treatment for prostatic disease; to the class in physics of the high school, in 1893, he demonstrated the operation of electric motors and of the Brush electric light, the kind then in use in the city. He is remembered as an inventor of many mechanical devices, among which were a vacuum pump, and a cane that doubled as a medicine case. The cane separated into two main parts, the outer portion serving as the sheath of the inner section, which was fitted throughout its length with a tin trough in which rested medicine bottles; they rested none too securely, for occasionally when the cane was pulled apart, they all fell out.

During his years in Rochester, Dr. Adams occupied several different offices, first over Hargesheimer's Drug store, and from 1894 to 1903, ground floor rooms in the Brackenridge Building, in order to save his numerous rheumatic patients the inconvenience of climbing stairs. For the next three years he occupied a small detached frame building of considerable historical interest, it having been the original home, in 1864, of the First National Bank of Rochester. In Dr. Adams' time this building, which had a high false front and a front porch with supporting pillars of the southern colonial type, stood well back from the sidewalk on Zumbro Street, on part of the site of the present Martin Hotel. After 1906 the doctor had space upstairs in the Ramsey Building.

When Dr. Adams first came to Rochester, it is said, he began to practice without first observing the convention of introducing himself to physicians already established, an oversight that brought him the criticism of older practitioners. If at first careless of professional amenities, he was punctilious otherwise. He was a Mason, a Republican, an ardent prohibitionist. He became a supporter of the Young Men's Christian Association, a member of the Minnesota State Historical Society, and of the local Six O'Clock Club.

[†] In 1881 the majority of the medical faculty of Wooster University joined with the faculty of the Cleveland Medical College, which since 1843 had been the medical department of Western Reserve University. Within a year the name of the school was made "The Medical Department of Adelbert College of Western Reserve University." In 1822 the board of trustees of Western Reserve University conferred the ad eundem degree of doctor of medicine upon all graduates of the Cleveland Medical College and upon such graduates of the Wooster Medical Department prior to 1881 as desired it.

He was a prominent member of the Methodist Church, its Sunday School, Christian Endeavor and Sunnyside Club, attended church conferences, and occasionally occupied the pulpit in Rochester and in villages of the county.

As he became known in the district, his country practice grew heavy, especially in Kalmar Township, and in June, 1891, news items from Byron stated that Dr. Adams had fitted up an office in the J. B. Kendall house and would be found there Monday of each week. Tall, stout, heavy-jowled and florid, his brown hair parted low on the left, his mustache long and twirled at the ends, he became a familiar figure, and though he was quick-tempered and emotional, he was in general a kindly, friendly man who was well liked. In the early years he drove a horse to a light gig. When automobiles came, he had a Carter, a machine that was unpredictable under stress, the doctor's acquaintances have said, as its owner; when a car or a horse could not or would not go, Dr. Adams might resort to oaths and blows, but he was quite as likely to kneel and pray.

By the early nineties Dr. Adams had begun to figure in medical organizations and was attending meetings of neighboring county societies in company with Rochester physicians, among them Dr. A. F. Kilbourne and Dr. W. J. Mayo. He had by then become a member of the Olmsted County Medical Society, of which he was president in 1892. His name was on-the roster of the Minnesota State Medical Society and of the American Medical Association. In July, 1892, he was a charter member of the Southern Minnesota Medical Association, its vice president in 1893-1894, its president in 1901-1902. Records show that he presented numerous papers before local medical groups on many subjects, including rheumatism, cirrhosis, concussion of the brain, influence of the nervous system on disease, diagnosis of spinal diseases, and on the therapeutic uses of electricity.

He was preceptor to at least one medical student, a young man of merit, Patrick H. Manion, member of a well-known family of Eyota, who read with Dr. Adams from March to September, 1887. At the end of that time Mr. Manion entered Rush Medical College, from which he was graduated in 1890.

Dr. Adams was county coroner for two years from the autumn of 1894, and was intermittently county physician for the district comprising the city of Rochester and the townships of Marion, Rochester, Cascade and Haverhill.

In 1897 Dr. Adams was appointed city health officer of Rochester, a capacity in which he served for nearly fifteen years, with the exception of a period between 1906 and 1909, when Dr. J. E. Crewe held the office. Rochester grew rapidly after the turn of the century, there were many transients among its population, and the schools were large and were expanding. In 1911 and 1912 there came obstinate and recurrent epidemics of scarlet fever which alarmed laity and physicians alike and officials of the railroads over which many persons constantly were arriving in and departing from the city. Dr. Adams, as health officer, was working under a city council which in March, 1912, rejected the offer of the Minnesota State Board of Health to aid the city in securing an expert special health officer to supervise medical inspection of school children and to devote his entire time to public service in city and community; the salary was to be $3,000, one-third paid by the state board and two-thirds by the city. Rochester was honored as one of the first cities in southern Minnesota to receive the offer of special help. When the city council refused this opportunity, the representative citizens of Rochester were indignant. At this point the council reappointed Dr. Adams to succeed himself as health officer. He was typical of health officers of that period in countless communities throughout the state and country, and in the scarlet fever epidemic of 1912 he was confronted with an emergency with which he obviously was not fitted to cope. Matters came to a head on May 1 of that year when a large group of citizens, businessmen and physicians, presented themselves before a meeting of the council, rebuked the council and certain aldermen, demanded Dr. Adams' resignation, and proposed to seek at once the aid of the state board of health. Dr. Adams resigned, protesting only that his efforts had been hampered by interference. At the close of the hectic session, which took place between the hours of eight and twelve at night, a delegation proceeded by automobile to Mayowood, where they offered the vacant post of health officer to Dr. C. H. Mayo. Dr. Mayo accepted, and thereafter for many years he directed the public health work of Rochester.

After Dr. Adams retired as health officer, he returned to general practice. His chief intellectual hobby had always been the study of physical science. Increasingly from the early nineties he had become interested in psychic phenomena and also in the question of immortality, subjects on which he lectured before local groups and about which he began to write a book. Early in 1919, on inheriting a considerable fortune, it has been said, Dr. and Mrs. Adams returned to Ohio and thereafter made their home at Lakewood, on Lake Erie, near Cleveland. Dr. Adams' name was listed in each issue of the Directory of the American Medical Association from 1919 through 1934, after which it did not appear.

L. H. Aiken, who was born at Norfolk, Connecticut, about 1825, practiced medicine in Connecticut, and at Vineland, New Jersey, where he combined practice with operating a drug store. In the autumn of 1866 he came to Minnesota because of reduced health. After a short time in Saint Paul he came to Rochester, where with the exception of short intervals he spent the next twelve years. Throughout his residence he was a good and conservative citizen, a prohibitionist, a member of the Congregational Church, a worker for the improvement of the city schools; in 1872 he was a member of the school examining committee.

There is little evidence that Dr. Aiken practiced medicine actively in Olmsted County. It appears rather that he was a man of some means who chiefly conducted a loan and mortgage office; he had a brother who was at that time the president of the First National Bank of Chicago. At various times between 1867 and 1880 the doctor was associated in business with John Edgar, a citizen of Rochester, who for many years gave animation to the civic scene. For a time in 1867 and 1868 Dr. Aiken and his wife, a native of Hartford, Connecticut, left Rochester for Rockford, Illinois, where the doctor was engaged both as a real estate dealer and a druggist. Mrs. Aiken died in Rockford, and in 1869 Dr. Aiken returned to Rochester.

On July 5, 1871, after a sedate courtship which is recalled by Rochester residents who then were school children, Dr. Aiken was married in Rochester to Miss Isabella Cutler, of Lexington, Massachusetts. Mrs. Aiken was a woman of charm and ability, who had been a member of the high school faculty since 1868 and, for a time, high school principal, the first woman to hold the position in Rochester The Aiken home was "on Third Street, south of the Court House," the red brick house to be occupied forty years later by Dr. Georgine M. Luden. In the next few years Dr. and Mrs. Aiken spent the winters in southern travel for the doctor's health. In Nassau, in March, 1880, Isabella Cutler Aiken was stricken with yellow fever and died within a few days. Dr. Aiken, then rapidly failing, returned to Rochester to dispose of his property in preparation for spending his declining days in his native place. He died in Norfolk, Connecticut, on October 31, 1880. An obituary contained the following comment: "Trained from his early youth under one of New England's truly great men, he died as he had lived, in the faith of his fathers."

Joseph Alexander (1826-1896) was from 1854 a useful citizen in Rochester, Minnesota, successively carpenter, furniture manufacturer and proprietor of a woolen mill. At all times he was an evangelist who believed in free thought and free speech, and, wherein this chronicle is concerned, an herb doctor. His factory, mill, and later a feed mill occupied sites on Bear Creek in southeastern Rochester. The family home near by was not far from the spot where some years later Dr. W. W. Mayo had his farm home. In earliest years the neighborhood was a lonely one where inquisitive Indians and prowling black bears were the most frequent callers.

Born in the Parish of Ramsbury, County of Wilts, England, Joseph Alexander came to America in 1844 accompanied by his bride, who had been Hannah White, daughter of a feed and coal dealer of the same parish. After a brief stay in Albany, New York, Mr. and Mrs. Alexander traveled to Whitewater, Wisconsin, where they lived nine years before settling in Minnesota.

On a first trip of investigation into Minnesota Territory, Mr. Alexander caught a ride from La Crosse with a man and his son who were driving to Oronoco. In the late afternoon of October 12, 1854, the party crossed the Olmsted County line and stopped for the night at a camping ground by a stream. "At the spring I found several of the campers sick and as I had some medicine with me and also understood what herbs to administer to the sick, this was my first practice in Minnesota."

This practitioner at no time claimed to be a member of the regular medical profession, although he long had an extensive practice and sometimes used the title "doctor." His home was his office and there he had a medicine closet about 6 x 8 feet, lined with shelves on which were stacks of little white boxes that contained his herbs, powders and pills. After his death his daughter, Mary, carried on the practice, combining it with practical nursing and midwifery. One of his early circulars is quoted here, in simplified form, because it indicates the undertakings of a representative herb doctor in the second half of the last century, an honest man who played a part in the healing of the sick:

> Nature's Remedies. Purely Vegetable! Dr. J. Alexander's Herbal Remedies. Will purify the blood from all impurities. Use Dr. J. Alexander's Vegetable Medicines for healing diseases, both chronic, acute and constitutional, such as: Blood poison, scrofula, salt rheum, neuralgia, la grippe, constipation, liver disorders, rheumatism, malaria, eczema and itch, worms, tape worm, and consumption. Heart disease, dyspepsia, indigestion, Bright's disease and other kidney troubles, all lung diseases, sick headaches, croup, erysipelas, diphtheria, piles and catarrh.
>
> My Bitter Sweet Ointment for all aches and pains, rheumatism, pneumonia, cuts, burns, sprains and fever sores. Try it and find out what it will do.
>
> Mrs. J. Alexander will prepare, and put up for sale, medicines for the diseased conditions peculiar to women. Will keep, also, Dr. O. P. Brown's Tissue Builder for ladies, for the skin and complexion.
>
> My medicines are extracted by the cold process, so that they lose none of their virtues by heat.
>
> Please preserve this circular and I will call for it.

In 1946 there were living more than a hundred descendants of Joseph and Hannah Alexander, many of them in Olmsted County.

Joseph S. Allen (initials sometimes misprinted J. A., J. H., or J. L.), a member of the regular profession, physician and surgeon, came to Rochester, Minnesota, in March, 1865, from Crawfordsville, Montgomery County, Indiana, accompanied by his wife, who was in frail health, and their four children, two sons and two daughters. Dr. Allen announced that he had purchased the property known as Head's Block on the corner of Main and College Streets, and that in one of the stores of the building he expected to establish a drug store. Mrs. Allen died in Rochester on December 26, 1868, after a protracted illness from pulmonary tuberculosis.

Although Dr. Allen's personal story is here incomplete and the family history has not been learned, significant information has been gleaned. Dr. Joseph Allen, of Crawfordsville, Indiana, was present on June 6, 1849, at the historic medical convention held at Indianapolis and became a charter member of the Indiana Medical Society organized on that date. Dr. Joseph S. Allen, of Crawfordsville, served during the Civil War as surgeon of the Tenth Indiana Volunteer Regiment of Infantry.

In Rochester, Dr. Allen was active in organizing the early Olmsted County Medical Society, the initial meeting of which was held in his office on April 15, 1868. He served as president pro tem, submitted an acceptable constitution for the society, was elected the first president, was appointed head of the committee on obstetrics, and was one of a committee of six to draw up the first fee bill.

At the annual meeting of the Minnesota State Medical Society in Saint Paul on February 1, 1870, Dr. Allen became a member, and although he moved from the state two years later, his name remained on the roster through 1876. In 1871, having recently visited the Pacific Coast, he discussed before the society the climate of California in relation to phthisis.

From the memoirs of the late Dr. David Sturges Fairchild, of Iowa, who from May, 1869, to July, 1872, was a young practitioner of medicine in the village of High Forest, Olmsted County, comes an anecdote that gives the only reference noted to Dr. J. S. Allen's age and cites an incident in his practice. During the winter of 1870 Dr. Fairchild was called on a case of puerperal convulsions, the first of the sort he had seen. At the end of some thirty-six hours he confessed himself discouraged, and Dr. Allen was called in consultation. "To my great comfort the weather became so bad that Dr. Allen would not venture to return home. It was midwinter and the roads nearly impassable. Taking the roads together with the storm and Dr. Allen's advanced age, there seemed no choice for the doctor but to remain all night." In discussing treatment Dr. Allen decided against giving the patient morphine because it was too dangerous and "would be only piling congestion on congestion." When both physicians had given the patient up, however, he agreed that under the circumstances the drug could do no harm, and Dr. Fairchild administered about one fourth grain of morphine, measured out on the point of a knife blade. The patient recovered.

Although from 1865 to 1872 Dr. Allen maintained his home in Rochester, he was away months at a time, in Indiana or in the West, because of impaired health. In April, 1872, convalescent after a stroke of paralysis, he disposed of his effects in Rochester and with his son, Joseph F. Allen, and his two daughters, one of whom was an invalid, moved to Washington, in the region of Puget Sound.

The son, Joseph F. Allen, who long was a resident of Yakima, was married at Oakland, California, in 1878, to Mary J. Furlow, daughter of John and Elizabeth Young Furlow, pioneer settlers of Olmsted County, and sister of Samuel C. Furlow, who for many decades was a resident of Rochester, prominent in business and in civic and educational enterprises. John Beard Allen, second son of Dr. Allen, was married to Celia Bateman of Rochester. For two and one-half years he studied law in the office of the Hon. Charles C. Willson of Rochester, and after being admitted to the bar, he also moved to the Northwest. John B. Allen became United States Senator from Washington; he died in 1903.

Wilson Adolphus Allen was born on March 6, 1834, in Pendleton, Madison County, Indiana, and died in Rochester, Olmsted County, Minnesota, on May 11, 1934. He had been engaged in the practice of medicine seventy-four years, for seventy-two of which he had been a homeopathic physician. He spent sixty-nine years in Minnesota, sixty-two of them in Olmsted County. At his death he long had been the oldest practicing physician in the state.

Wilson A. Allen was one of eight children born to William Allen, a native of North Carolina, and Sara Prather Allen, a native of West Virginia. The progenitors of this branch of the Allen family, Leonard stated, were three brothers of English extraction who came from Switzerland and settled in New England and the Carolinas in an early period of American history. Joseph Allen, a farmer, father of William Allen, immigrated to Wayne County, Indiana, in 1809. William, also a farmer, removed to Madison County, where he made his home; he died in 1875, at the age of seventy-seven years, while on a visit to his son in Rochester, Minnesota. In 1910 there were living of the family, besides Dr. W. A. Allen, two daughters, Mrs. H. A. Mann, of Wells County, and Mrs. C. W. Wyany, of Hendricks County, Indiana, and Dr. Benjamin Frank Allen, of Glencoe, Minnesota.

Relationship between Dr. Wilson A. Allen and Dr. Joseph S. Allen, subject of a preceding sketch, has not been established, but it is interesting that the Christian name, *Joseph,* was common to both families and that both groups were early in Indiana.

Wilson A. Allen received his early education in the district schools and the seminary at Pendleton. Although for a short time he studied for the ministry, record shows that after his graduation from Franklyn College, Johnson County, Indiana, he returned to Pendleton Seminary for one year as instructor in mathematics and that thereafter for four years in Pendleton he conducted a drug store and during that time studied pharmacy. From childhood he had wanted to be a doctor, and in 1860 he began the study and practice of medicine under Dr. T. G. Mitchell (1827-1903), of Pendelton, a physician of the old school, with whom he remained five years.

On October 25, 1855, Wilson A. Allen was married to Flora S. Huston, a daughter of John Huston and Anna Huston of Portsmouth, Ohio; John Huston, a native of New York, was a builder of boats that plied the Ohio River and tributary streams. In 1856 Dr. and Mrs. Allen came to the vicinity of Cedar Rapids, Iowa, where they lived on a homestead for three years; in 1859 they returned to Indiana, and in 1865, because of the doctor's ill health, they came to Plainview, Wabasha County, Minnesota, accompanied by members of the Huston family. Mr. and Mrs. Huston spent their old age in Rochester, where they died in their eighties in June, 1890, and May, 1891, respectively; they were survived by two daughters, Mrs. Allen and Mrs. W. L. Hardy, of Plainview.

Dr. Allen came from Plainview to Rochester in September, 1872, taking over the practice that he had purchased in the preceding June from Dr. Edmund Beckwith, a homeopathic physician who was removing to Muncie, Indiana. In May, 1877, Dr. Allen entered partnership with Dr. Frederick R. Mosse, a young recent graduate of the Homeopathic Medical College of Chicago, who had come to Rochester a few weeks earlier They had a suite of offices in the Leland Building, which for decades was Dr. Allen's headquarters. The partnership was dissolved in the summer of 1879. Early in 1879 Dr. Allen recognized the desirability of a degree in medicine, and in March of that year was graduated from the Hahnemann Medical College and Hospital of Chicago.

For the next thirteen years Dr. Allen practiced alone, extending his already county-wide practice. Often in a surgical case, of hydrocele, uterine fibroids, nevus, hernia or other condition, in which the operation was performed at the patient's home, he was assisted by his friend, and later his partner, Dr. O. H. Hall, once of Ohio, who was long in Zumbrota, Goodhue County, Minnesota. Dr. Allen took a postgraduate course at the Hahnemann Medical College of Chicago in 1883, made numerous clinical trips, and was faithful in attendance at meetings of homeopathic medical groups. He was active in the Southern Minnesota Homeopathic Medical Society and in the American Institute of Homeopathy. In 1887 he was elected vice president of the Hahnemann Alumni Association.

In the spring of 1892 Dr. Charles T. Granger, of Rochester, newly graduated from the Hahnemann Medical College of Chicago, returned home to enter partnership with Dr. Allen, the senior partner to specialize in the diseases of women and the junior in diseases of eye and ear. Dr. Allen at that time was interested in treatment for hernia also, by the Fidelity Method, which was said to obviate the need for truss or surgical intervention. In November, 1892, Drs. Allen and Granger opened the Riverside Hospital in East Rochester. In the history of this hospital, given earlier in this paper, it was told that when the hospital was closed in September, 1895, Dr. Allen moved to Saint Paul, in partnership with Dr. O. H. Hall, although he maintained his home in Rochester. Because he was then mayor of Rochester, he held his mayoralty and returned to Rochester once a week, to inspect construction of the city's new sewer system and to meet with the city council. Early in 1896 he terminated his practice in Saint Paul and returned home.

(To be continued in the March issue)

President's Letter

POSTGRADUATE SEMINARS

IT IS BECOMING increasingly difficult for American physicians to be good physicians.

Paradoxically, the myriad developments of medical science that are making the conquest of disease easier, are, at the same time, making the practice of medicine more complex and challenging.

Each of us, if we are to uphold the constantly climbing standards of the profession, must serve as a repository for an overwhelming store of therapeutic knowledge and skills. Fortunately this obligation is easier for us to assume than it might be, due to the efforts of the American Medical Association, our own State Association, the component county medical societies, the Minnesota State Board of Health and the University of Minnesota Medical School.

These groups offer continuing opportunities for the acquisition of advanced information: the national, state and county societies, through periodic scientific meetings; the Board of Health and the Medical School, often pooling their facilities to develop post-graduate courses and clinics for study.

Minnesota physicians are familiar with the courses held at the University's Center for Continuation Study; but the newest result of concentrated analysis of the post-graduate study problem is the presentation of post-graduate seminars in the various districts of the state. Emphasis currently is on cancer, cardiovascular diseases and psychosomatic medicine. Pattern for the eight-week course is an informal one, with physicians, nurses, dentists and pharmacists gathering to discuss these problems with members of the University medical staff.

Inclement sub-zero weather during the two initial presentations did not restrain the attendance and interest of the Duluth series of meetings in progress. These are the first of courses to be presented throughout the state. Component societies are encouraged to prepare for these seminars and participate in the preparation of the programs.

F. J. Elias.

SOCIALIZED MEDICINE

THE FOLLOWING editorial appeared in the *Minneapolis Star* of July 6, 1949. Senator Humphrey of Minnesota apparently thought it so good that he presented it to the U. S. Senate on August 1, 1949, for publication in the Appendix of the Record.

> SOCIALIZED MEDICINE?
>
> "Socialized medicine" is a term seldom used by the British, although obviously that is what they have got. Medical services are paid for from general taxation, private practice is discouraged, and hospitals have been taken over by the Government.
>
> The Labor Party in Britain is a Socialist Party, but it isn't often called that. Thus Britishers are not likely to apply the word "Socialist" to projects of the party. They speak of their "health scheme." When they occasionally say "socialized medicine," they have borrowed the phrase from America.
>
> In this country socialized medicine is applied to many things which aren't socialistic in the usually accepted sense.
>
> The administration has proposed a national health-insurance program to me financed by pay-roll deductions and other taxes. Many legitimate arguments may be brought against such a plan—the shortage of doctors, the tendency of people to make unwise demands upon public services, the advantages of voluntary medical insurance, etc. But the administration proposal is hardly more socialistic than our present social-security setup with its old-age and other benefits.
>
> Propagandists against public health insurance are partly responsible for calling this plan "socialized medicine." Whether such usage helps their case or not is problematical. But they may be breeding a great danger for the future.
>
> If at some time a public-insurance system is voted in the United States, the people may come to accept it as socialized medicine. That might make them more easily susceptible to the truly socialistic projects which lead so easily to statism.
>
> Let's not say socialized medicine unless that is really what we mean.

We are reproducing the editorial, for it offers a good illustration of the confusion which exists in many quarters in the use of the terms "socialize" and "socialism."

In England, according to the editorial, medical care is provided by the government as part of the socialistic form of government. The English do not call it socialized medicine but that is what they have. Essentially, the same kind of medical care is proposed for our country, but we mustn't call it what it is—socialized medicine—because if and when a public insurance system is adopted other "truly socialistic projects" will be more easily adopted by the public.

Even Webster leaves room for uncertainty as to the meaning of "socialize" when he defines it at "to render social or socialistic." "Socialism" he defines clearly as "a political and economic theory of social reorganization, the essential feature of which is governmental control of economic activities, to the end that competition shall give way to co-operation and that the opportunities of life and the reward of labor shall be equally apportioned."

A completely socialistic government would therefore be complete control of economic activities. While in England there still exists some private industry, the government has control of most of the economy, and England is a good example of a socialistic government which it took forty years gradually to achieve. The term "socialize," however, can refer to socialism as a theory of government or to group action which may have nothing to do with socialism. Commercial insurance companies assume risks already present. In a sense, the industry is socialized. The government provides hospital care for those who cannot provide it for themselves through private means. This is socialized medicine but scarcely socialistic.

When the government enters a field in competition with private industry, however, that is socialism, and socialism has been making inroads on our economy to an alarming degree. Private industry cannot compete with government-backed projects in which tax funds make up deficits. Government monopoly is bound to result eventually.

Socialism has entered our economy farther than many realize. It has been fostered by various groups, is known under a variety of disarming names, and has been insidious in its operation. Any government that competes with private industry in the building field, electrification, financial loans, et cetera, has become socialistic. The seriousness of the situation has been called to the attention of our citizens forcibly by John T. Flynn's book, The Road Ahead—America's Creeping Revolution.* The book is rightly a best seller and every American who has the preservation of private industry and freedom at heart must read this book. *The Reader's Digest* is to be congratulated for running a condensation of the book as the leading article in its February, 1950, issue. We, in America, are drifting rapidly in the same stream that caught England and sapped its vitality. Only an informed and freedom-loving public can prevent the extension of socialism and a reversal in the present tide.

RED CROSS FUND CAMPAIGN

IN MARCH each year, the American Red Cross goes to the people of this country for support of its program for the year. The Red Cross has a peace program which has many worth while facets. It is constantly organized to meet emergencies such as are presented by flood, fire and hurricane with assistance to the unfortunate. Less known activities include the services of some 2,000 Red Cross field workers to the armed forces at home and abroad which last year cost some $17,000,000; the Red Cross Motor Service which clocked up some 9,000,000 miles of transportation last year; the twenty-eight regional blood centers with thirty-two attached mobile units, serving population areas totaling 40,000,000 persons. It is expected that some fifteen additional regional centers will be established during the fiscal year and that blood collected from voluntary donors will be distributed to nearly 2,000 hospitals. Since the Red Cross began its Water Safety program in 1914, it has issued over 6,000,000 certificates for courses completed in swimming and life saving. The Red Cross also has its representatives in the sixty-eight Veterans Administration hospitals, has recruited nurses for "polio" duty and for disaster-relief operations, and conducts classes for children in the primary and elementary grades in accident prevention, and other safety measures.

The Red Cross, because of its performances over the years in peace as well as in war, has no difficulty in selling itself to the people. Its newest departure, however—the supplying of blood banks to communities—perhaps its most valuable peacetime activity, is a very costly project and requires therefor generous financial support. Fully as essential is generous co-operation on the part of blood donors. A realization of the often lifesaving qualities of this comparatively new therapeutic agency should be sufficient to assure the success of the Blood Bank.

ELECTROPHRENIC RESPIRATION

THE *Harvard Public Health Alumni Bulletin* for November, 1949, contains an account of the development of the electrophrenic respirator in the Physiology Department at Harvard. This unique method of producing artificial respiration by electrical stimulation of the phrenic nerve was developed by Dr. Stanley J. Sarnoff and Dr. James L. Wittenberger first on experimental animals (antivivisectionists take note) and then on human beings. It was found possible to apply the current in such a manner that lung ventilation could be controlled as to depth and frequency. A striking feature was that artificial excitation of the phrenic nerve caused immediate suspension of activity of the respiratory center provided the artificial respiration was sufficient to supply oxygen demands.

At first the electrode was supplied to the exposed phrenic nerve. Later it was found that the electrode need only be placed on the skin overlying the phrenic nerve, the indifferent electrode being placed over the corresponding shoulder. The only sensation experienced is a slight tingling at the point of contact.

Work began on the development of the apparatus in January, 1948, and it was first used in the fall of 1949 on a nine-year-old boy at the Children's Hospital in Boston who was suffering from respiratory difficulty resulting from poliomyelitis. His respiration was maintained continuously for three days and three nights and intermittently thereafter for another three days while his respiratory center was recovering.

One important point is that the patient must have constant attendance on the part of a trained individual lest the electrode slip from its position. Although other patients with bulbar involvement in Boston and at the Los Angeles County

Hospital have been kept alive by this method, it has not so far replaced the Drinker body respirator (iron lung) which incidentally was also developed at Harvard by Philip Drinker and Louis A. Shaw. The importance of a maintained electric current is most obviously vitally essential for both apparatuses.

PREVENTION OF DENTAL CARIES

IT was about 110 years ago that dentistry in America began to be a specialty distinct from medicine. During this period American dentistry has become "tops" compared to dentistry in the rest of the world. But in the prevention of dental caries there seems to be a woeful lack of knowledge.

There is nothing new in the idea that fermentation of starchy food between the teeth causes the formation of lactic acid which affects the enamel of the teeth and leads to decay; hence, the well-nigh universal recognition of the importance of brushing the teeth. It is true that there has been some difference of opinion as to whether the direction of the brushing should be north and south or east and west; whether a powder has distinct advantages over a paste; and whether a medicated or simple alkaline dentifrice should be used. The use of dental floss or a toothpick following a thorough brushing of the teeth will convince the most skeptical that brushing alone is not 100 per cent effective.

In the February issue of *The Journal of the American Dental Association,* Dr. Leonard S. Fosdick, professor of chemistry at Northwestern University, reports that as a result of a study of nearly 1,000 college students, he has found that the simple expedient of brushing the teeth immediately after meals or after the ingestion of sugar-containing food with an unmedicated dicalcium phosphate dentifrice reduces the incidence of caries more than 50 per cent. He claims to have shown that the acid action on the enamel surface of the teeth begins as soon as three minutes after the sugar enters the mouth, reaches a maximum acidity within twenty minutes, which persists for thirty to ninety minutes. This confirms the opinion widely held by dentists that the ingestion of candy is deleterious to the teeth. The same presumably holds for chewing gum and soft drinks, both of which contain a high percentage of sugar. The author seems to have proven statistically that students who had candy and soft drinks conveniently available suffered from more dental caries than those who did not, and the mere easy access of a drinking fountain for use after ingestion of the sugar caused a demonstrable lowering of the incidence of caries. We would suggest a further arbeit for the author in the way of an investigation of the value of dental floss or the toothpick after meals in reducing dental caries. We venture to predict a still further lowering of dental caries by this simple means.

Whether the methods of prevention of dental caries as here suggested are likely to be generally adopted, however, seems problematic. We have difficulty in visualizing the general adoption of the use of the toothpick after dessert, even though the procedure is politely shielded by a napkin; or the carrying of a toothbrush for easy availability after meals; or the final swishing about of a mouthful of water in order to wash away the sugar in the mouth so dangerous for the dental enamel.

Putting levity aside, Dr. Fosdick's observations contain suggestions which can be put into effect at least in part to lessen dental caries. Brushing the teeth after eating rather than on rising and retiring and the drinking of water after eating food containing sugar are procedures easy to follow.

The initial quality of the enamel and dentine of the teeth depends, without any doubt, on the quality of the diet. The natives of certain South Sea islands who live largely on fish and animal oil are said to have perfect teeth. This suggests that calcium and vitamins are important factors. The same holds true for individuals who have been born and brought up in areas where the soil contains fluorine. This observation has led to the discovery that the topical application of 2 per cent sodium fluoride to the permanent teeth of children once or twice a week on four occasions after a cleaning of the teeth results in a reduction of 40 per cent in the incidence of caries.* The preliminary cleaning of the teeth seems essential. Following the application with a 5 per cent solution of calcium chloride or more than four applications of the sodium fluoride solution does not produce any additional reduction in the incidence of caries. Here is a simple procedure which seems to merit extended trial and is being widely investigated.

---

Minnesota State Medical Association
George Earl, M.D., Chairman

FSA ESTIMATES 1960 NEED FOR DOCTORS

Using three methods of computation, the Federal Security Agency has estimated the number of physicians needed in 1960 by the United States. The estimates vary from 244,532 to 272,172.

Applying the formulae to Minnesota, the FSA would raise the number of physicians in this state from 1940's total of 3,280 to either 5,021 or 4,723 or 4,218.

These studies, complete with charts and graphs, are included in a publication entitled "Health Service Areas" and subtitled, "Estimates of Future Physician Requirements." Anyone interested may order this publication by writing the Superintendent of Documents, U. S. Goverment Printing Office, Washington, D. C.

EWING DENIES ANALOGY OF BRITISH, U. S. PLANS

Oscar Ewing's six weeks' inspection of Europe is over and he is now engaged in deflating, somewhat, the airy balloons of confidence he was launching upon first looking into Bevan's England.

Earlier quoted as ready to transfer, with only minute changes, the British health scheme to America, Ewing says now, in a laborious statement that perhaps consumed most of his voyage home, that the two plans are entirely unlike.

"I come home with even greater confidence in President Truman's proposal for national health insurance in the United States," he declared. But his statement could be examined from both sides: was England's system working out so inefficiently that anything else in the line of health insurance looked good or, was the English system, in practice, so beneficial to the people that the Administration's prescription for tax-medicine should not be longer delayed?

Mr. Ewing does nothing to clarify this issue as he continues his press release:

> "His (the President's) proposal is based on principles entirely different from the British program, which I investigated in some detail. The British plan is totally unsuited for the United States. In England the health service is part of a broad program to reorganize the basic social and economic structure of the country, and eight-tenths of its costs come out of general tax revenues. This is utterly foreign to the President's proposal."

National Press Club members, lacking Mr. Ewing's facility for regarding two diametrically opposed statements as consistent, were asking some embarrassing questions when he addressed that group on January 24.

LAYMAN AMONG FIRST TO PAY AMA DUES

This month the AMA received a check for $25 and an explanatory letter from a Chicago businessman. The letter said, in part:

> "I cannot put M.D. after my name but I can, at least for a while, still put U.S.A. As a consequence, please accept the enclosed check for $25 as a slight token of regard for my doctor and all his colleagues. These are my 'dues' as a citizen, and I hope they will help in your fight against socialized medicine."

STASSEN ATTACKS SM IN PRINT, ON AIR

Harold E. Stassen, president of the University of Pennsylvania, has loosed an effective blast of statistics and observations against the Truman health plan.

Writing in the January *Reader's Digest,* the former governor of Minnesota quipped:

> ". . . it is my considered opinion that the British program has resulted in more medical care of a lower quality for more people at higher cost."

Most convincing of his statements was this:

> ". . . it does seem that the additional tombstones in the British cemeteries—72,125 more than in the year before the National Health Program went into effect —are grim signposts on which we can read: 'Never take this road for a National Health Program.'"

Stassen has just completed a very extensive study of the British health scheme and his report, pared of adjectives and emotionalism, presents a sharp contrast to Mr. Ewing's six-day tour of Britain and his report of "Excellent."

On January 29, Mr. Stassen met Senator Pepper (Florida) in a radio debate, and left the senator sans argument and sans applause.

The senator, reciting the virtues of compulsory health insurance in other countries, lost ground when he cited Sweden as an example and was confronted by the fact that Swedes live longer in Minnesota than they do in their native Sweden.

He came a cropper again when he brought up the matter of inequitable distribution of medical care and was reminded by Stassen that the most severe cases of maldistribution are to be found in the South, where the Senator's own political party fosters the race prejudice that deprives Negroes of fair opportunity for medical care and medical education.

LONDON TIMES POKES FUN AT SOCIALISM

Last month the *Wall Street Journal* devoted an editorial to the neglected canines, felines and even bovines under the present social security system.

This month the London *Times* is concerned about this same question, having been prompted by news of three collies seeing a "Lassie" movie.

Said the *Times:*

> "It must be confessed that the animals, so far, seem to be getting precious little out of the welfare state. Nothing has been done to provide them with a longer period of compulsory education; they have no right to free false teeth or a cheap interment; no one has given them a five-day week.
>
> "Perhaps all this is to come. Perhaps, when there is rather more money in the Exchequer, the Government will be able to mobilize a corps of inspectors to check up on the overtime put in by sheep dogs, to make sure that children's ponies are getting their due amount of leisure and to inculcate in the cat that parity of esteem for its fellow animals which at present it so conspicuously lacks. Meanwhile, a tentative, but significant, step in the right direction has been taken at Whitley Bay, though admittedly only by private enterprise; for the three men who took their collies to see a film seem to have done so without the support of the Arts Council or any similar body."

The editorial goes on, with trenchant drollery, to enumerate the problems which this new sphere of activity would bring about in an already regulation-ridden socialistic state. For example:

> "If some dogs are capable (as seems the case) of enhancing their cultural status by going to see a film about a dog, have we any right to deny our horses a similar opportunity?"

The absurdity of the editorial transfers easily from the animal world to the human one and it appears that more than one Britisher would find the humor grimly applicable.

MANY COMPROMISE BILLS IN HOPPER NOW

Most legislative prophets have been saying that the Administration's health bill, containing such familiar clauses as "payroll deduction," "central fund," et cetera, hasn't a hope of passage this session of congress. However, physicians, and the public whose health is guarded by family physicians, cannot relax at this point. For, although the lay public is beginning to be apprised of the dangers inherent in a compulsory system of medical care, engendered and controlled by the government, the public is not so well aware of the dangers of so-called compromise proposals, proposals which would bring on government control by progressive stages.

The school health service bill (1411) is a key example of this piece-meal type of legislation—bringing in, as it would, all school children between the ages of five and seventeen, under a government medicine program. Dangers lurk, too, in many of the medical education assists which are constantly being proposed, altered and considered by committees and suspiciously viewed by those who see in federal money a hint of federal interference.

Compromise bills are being advanced by many congressmen who have a sincere interest in bettering the health of the nation, but whose proposals would short cut the necessarily slow, but sound, advancement of better health standards through the extension of methods already tried and proven.

Many who look at England's system see favorable results. They take an unscientific view, seeing more people going to the doctor and receiving more medical and hospital care than heretofore. Even admitting the abuses committed by hypochondriacs and malingerers, the system is still considered by some as good. They even draw a comparison between the medical and hospital care afforded to veterans in this country under a governmental system. The critical fallacy in this thinking is that not now, nor in the future, will great medical discoveries emerge from laboratories or practices which are supervised by the government.

Minnesota Academy of Medicine

Meeting of November 9, 1949

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, November 9, 1949. Dinner was served at 7 o'clock and the meeting was called to order at 8:10 p.m. by the President, Dr. J. A. Lepak.

There were sixty-two members and two guests present.

In the absence of Dr. Cardle, Dr. William Hanson read the minutes of the October meeting, and these were approved as read.

Dr. Harry Zimmermann read a memorial to Dr. L. C. Bacon, who died June 4, 1949. (This Memorial was published in the September, 1949, issue, page 932.)

Dr. Erling Hansen read a memorial to Dr. Walter E. Camp, who died September 4, 1949.

WALTER E. CAMP

1889-1949

Walter Edward Camp was born on September 21, 1889, in Springfield, Missouri, and died September 4, 1949, in Minneapolis, after several months' illness. He was educated in the public schools of Springfield and the University of Missouri where he was given his A.B. degree. From 1908 to 1912 he taught histology at the University of Missouri, where he began his medical course. In 1912, he came to Minnesota where he continued to teach in the Anatomy Department, while he finished his medical school work. He received his M.A. and M.D. degrees in 1915, and interned at St. Andrews Hospital. He took postgraduate work in eye, ear, nose and throat at New York Post-Graduate Medical School and Hospital during part of 1917 and 1918 and at the Massachusetts Charitable Eye and Ear Hospital in 1921. Later he spent several months in Vienna. During World War I, he was a Lieutenant in the Medical Corps of the Army, serving for some time in Camp Dodge, Iowa, and in Washington, D. C. For several years after the first World War he was associated in practice with Drs. Horace Newhart and Erling W. Hansen. Since 1928, he had maintained an office alone in Minneapolis.

Dr. Camp was assistant professor of ophthalmology in the University of Minnesota Medical School, where he was a valued teacher in ocular pathology. His preeminence in this field was nationally recognized, and, for several years, he taught pathology in the Instructional courses given by the American Academy of Ophthalmology and Otolaryngology at its annual meetings.

Dr. Camp was a member of the Staffs of Northwestern and Abbott Hospitals, and of the Minneapolis Academy and Minnesota Academy of Medicine and the Minnesota Academy of Ophthalmology and Otolaryngology. He had been president of the latter two organizations. He was a member of Hennepin County Medical Society, Minnesota State Medical Association, and the American Medical Association. He was a fellow of the American College of Surgeons. His medical fraternity was Phi Beta Pi, and he held membership in Sigma Xi, honorary scientific fraternity, and Alpha Omega Alpha, honorary medical fraternity. He belonged to the Minneapolis Club and Minnikahda Club and was a 32nd Degree Mason.

Dr. Camp was married to Amy Floy Kinney, whom he met in Washington during the first World War. They had three children, Amy Katherine Camp Walker, Walter Edward, Jr., and Lucille Kinney Camp, all of whom survive him, together with three grandchildren and two brothers.

Walter Camp will long be missed by his friends in this Academy and his many other friends, as well as by his family to whom we extend our earnest sympathy in their great loss.

The scientific program followed.

LINGUAL GOITER

MARTIN NORDLAND, M.D. and MARTIN A. NORDLAND, M.D.
Minneapolis, Minnesota

The occurrence of thyroid anomalies in the tongue is quite rare. It might be observed more frequently if hypertrophy developed in nonmigrated thyroid tissue in all cases. This anomaly is reported only when it causes symptoms. It should be of interest to the profession in general from a diagnostic point of view, and is of unusual interest to the surgeon because of the practical problems involved in the surgical removal. The site for the occurrence of thyroid tissue in the tongue is at the pharyngeal portion in the region of the foramen caecum. The terms lingual thyroid, lingual goiter, aberrant or accessory thyroid are rather loosely used. The term *lingual thyroid* should be used when there is a thyroid gland in the neck and thyroid tissue in the tongue functioning as an accessory thyroid. Lingual *goiter* refers to hyperplastic thyroid tissue on the dorsum of the tongue which is the result of nonmigration of the thyroid anlage from the region of the foramen caecum with absence of thyroid tissue in the neck. The term *aberrant thyroid* should not be confused with *lingual thyroid* or *lingual goiter*. Convincing evidence has recently been presented by Warren and Feldman that lateral *aberrant* thyroids are metastatic tumors from carcinoma of the thyroid gland. The most comprehensive review of the incidence of lingual goiter and lingual thyroid appearing in the literature to 1936 was published by Montgomery. He established criteria of authenticity and accepted 144 cases, including one of his own. For his criteria of acceptance, he asked that (1) the examination of the specimen removed should reveal thyroid gland tissue, or that (2) thyroid insufficiency should supervene following the removal of the nodule, and that (3) the lesion should appear in the substance of the tongue between the epiglottis and the circumvallate papilla.

Of the 144 cases Montgomery accepted, the lesion

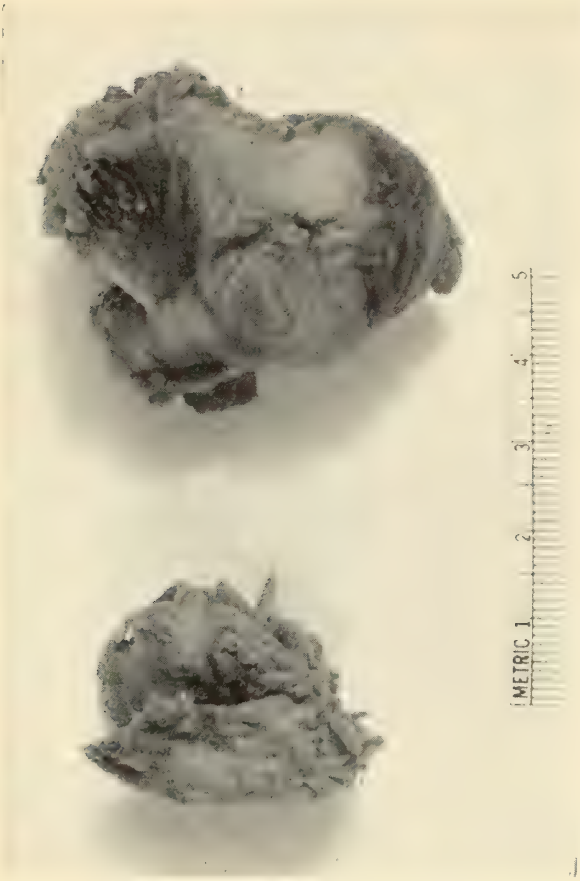

Fig. 1. Photographs of gross specimen.

occurred on the dorsum of the tongue in 142 instances.

Our case which fulfills all these requirements of the criteria of Montgomery is reported in order that it may be added to the cases reported in the literature. It was thought that it might be of interest because of the problem of diagnosis and the method of treatment.

Case Report

The patient is a white woman, aged fifty-seven, who was first seen by us on September 3, 1948 complaining of difficulty in breathing, recurrent hemorrhage from the mouth, husky voice, chronic cough, and a growth at the base of the tongue.

These were first noted about 1911, at which time she underwent an operation. Prior to this, she had consulted many doctors for all of the above complaints. The operation was unsuccessful because of profuse hemorrhage requiring a tracheotomy. The doctor told her that further operation would be necessary, and that he noted "crystals" in the contents of the "cyst" that he removed.

The patient had recurrent exacerbations of the above difficulties up to the time of our examination.

In the meantime, she consulted with numerous doctors and clinics without any definite diagnosis having been made. She, was treated alternately for allergy, chronic bronchitis, asthma and various respiratory disturbances without relief and with gradual increased severity of all her symptoms.

Physical examination revealed a thin, nervous white woman, aged fifty-seven, who appeared chronically ill. The general physical examination was negative with the exception of hypotension (blood pressure 92/70). The pulse was normal. Examination of the head and neck revealed a mass at the base of the tongue at the foramen caecum. This could not be visualized by ordinary examination with a tongue blade, but with the patient's co-operation, the upper surface of the mass could be seen and could be definitely outlined by digital examination. The mass was round, slightly irregular, relatively firm, not tender, and about 6 cm. in diameter. Blood studies and urinalysis were entirely negative.

The patient was operated upon September 10, 1948. Under intratracheal anesthesia, a transverse incision was made directly over the hyoid bone. The platysma muscle was divided and the hyoid bone exposed. Approximately half a centimeter of the hyoid bone was removed and the tumor at the base of the tongue mobilized. The mass was removed in three pieces with some difficulty, but hemastasis was adequate.

The mucous membrane of the pharynx was reapproximated with interrupted sutures of plain 0 catgut. The underlying cervical fascia was brought together with interrupted sutures 00 chromic. A running subcuticular suture of 00 plain catgut was employed and interrupted sutures of dermal and Wachenfield clips were used to close the wound. A split catheter drain was left in the operative field. The pathological report was as follows.

Macroscopic specimen—Specimen consisted of 12 grams of tissue removed from the base of the tongue (Fig. 1). The largest portion measured 5 cm. It was cystic and filled with degenerating necrotic yellowish brown tissue. It also contained a portion of the hyoid bone. A second portion measured 4 cm. and consisted of a thin walled cyst that contained necrotic granular material. The third portion measured 3 cm. and had an adenomatous yellowish brown appearance and contained two circumscribed nodules, measuring 1.5 and 1 cm.

Microscopic specimen.—Sections of the solid areas showed thyroid tissue composed of small acini that varied considerably in size. Some of the acini were fetal in type; others approached normal size and were well filled with colloid. There was a tendency for the acini to be arranged in adenomatous formation (Figs. 2 and 3). There was extensive degeneration present. Some sections showed marked hyaline degeneration with fibrous tissue replacement of the thyroid tissue. The cystic areas possessed a well defined fibrous capsule. The tissues were benign.

Diagnosis.—Aberrant thyroid tissue with fetal and colloid adenomas.

Comment

Because of the location of this tumor on the back of the tongue at the foramen cecum, it is correct to designate this as a case of lingual goiter (Fig. 4).

Thyroid insufficiency probably is responsible for most of the simple hypertrophies of lingual thyroid tissue. In about two-thirds of the patients who have been reported as having lingual thyroid hypertrophy, thyroid gland tissue was not demonstrable in the neck as in our case. Hypertrophy of thyroid tissue is very marked during the maturing peroid of puberty in early adult life. Likewise, many of the cases with lingual thyroids have been discovered during this period of life because of the tendency of thyroid tissue to hypertrophy at this

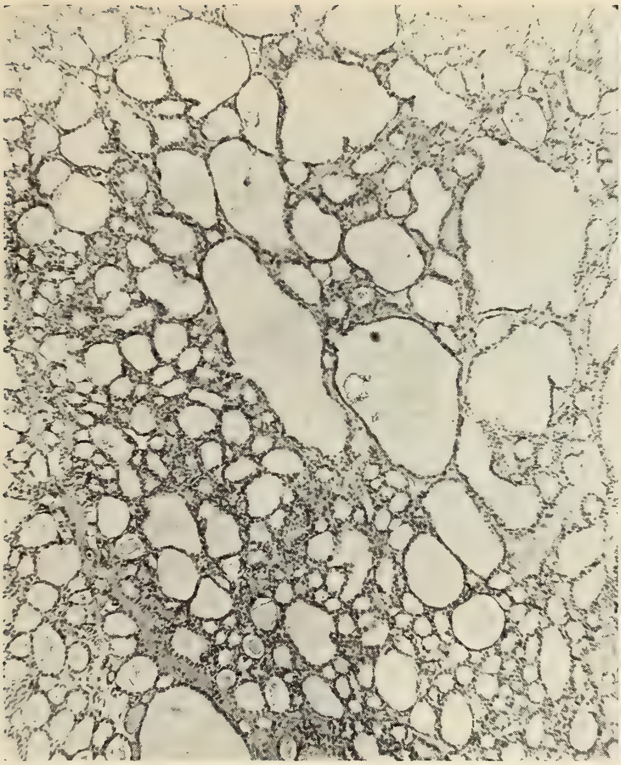

Fig. 2. Microscopic section under medium power (50X), showing a representative area. It cannot be distinguished from the usual colloid adenoma or benign adenoma of the thyroid.

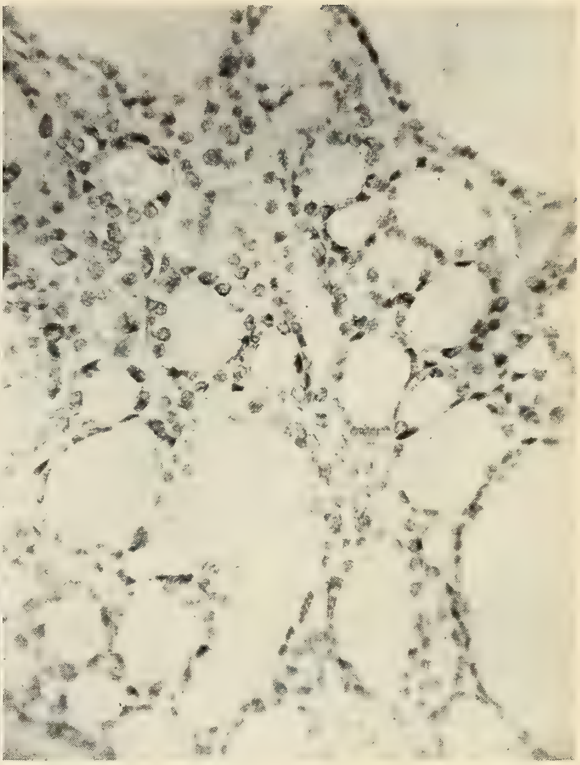

Fig. 3. Microscopic section under high power (200X) showing an area with small acini to show cell detail.

time. It is not easy to determine the etiology of the characteristic changes of adenomatous goiter in the tongue. The factors which cause this hypertrophy are probably the same as those causing the formation of a cervical thyroid adenoma.

Montgomery has stated that at least 90 per cent of the patients having a lingual thyroid nodule suffer from symptoms of pressure and obstruction such as dysphagia, dysphonia, and dyspnea. In our case, the most conspicuous symptom was dyspnea. She also had recurrent small hemorrhages, huskiness of voice, and a chronic irritable cough. The patient herself described the sensation of the presence of a tumor causing fulness and a feeling of tightness in her throat. She did not have pain. Because of her chronic cough, she was treated for "bronchitis" over a long period of time. She was also treated for some mysterious allergy. This patient had never had a basal metabolism test but her history revealed that she had a mild hypothyroidism. We were able to palpate the gland as described in the case history. The tumor had been described by an otolaryngologist as a tumor of the epiglottis. The diagnosis of lingual thyroid had not been made.

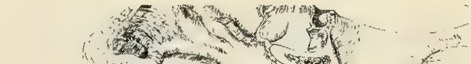

Fig. 4. Saggital section showing position of lingual thyroid.

The fact that this patient had been operated upon for this disturbance thirty-eight years ago made it easier for us to make a diagnosis. After palpating and visualizing the mass, we were certain we were dealing with a lingual goiter. Because she had had a hemorrhage upon the previous attempt at removal, because the operation could not be completed, and because she had to have a tracheotomy at that time, we felt that we should remove this tumor by going through the neck in the region of the hyoid bone. We followed the technique devised by Sistrunk for the excision of thyroglossal duct cysts (Fig. 5). This approach, together with intratracheal anesthesia, made it possible to remove this large mass deliberately and with safety.

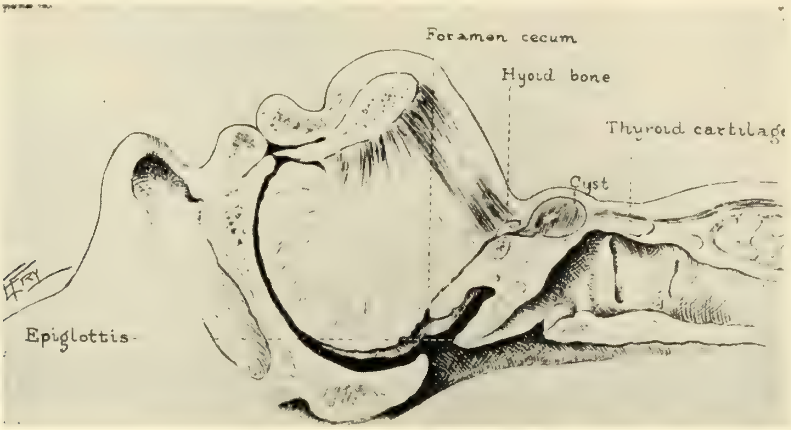

Fig. 5. Saggital section to show the operative approach used in this case.

One of the most interesting phases of this case was the fact that the patient developed advanced symptoms of hypothyroidism within six weeks of the operation. It had not occurred to us to discuss the possibility of the development of hypothyroidism to this patient. When she again appeared at the office about six weeks postoperatively, she was tired, had edema of the lids, dry skin, a marked slowness of speech, chilliness and all symptoms of postoperative myxedema.

The patient has now been observed for more than a year. She is taking 4 grains of thyroid extract daily, and is in excellent health.

THE FOURTH INTERNATIONAL CONGRESS OF NEUROLOGY

ERNEST M. HAMMES, M.D.
St. Paul, Minnesota

The Fourth International Congress of Neurology was held at Paris in Faculté de Medicine Building, September 5 to 10, 1949. Twenty-six countries had been invited; twenty-three representatives attended. Australia did not send any official representative. Russia and Yugoslavia did not even acknowledge the invitation, although the Russian language had been made one of the official languages, along with English, French and Spanish. The majority of the scientific papers were read in English and French. The attendance was about twelve hundred; over one hundred and fifty were from the United States of America.

Each morning session from 9:30 to 12:30 was devoted to a single important subject: on Monday, encephalography; on Tuesday, the various problems of the thalmus; on Thursday, virus infections of the central nervous system; on Friday, neurosurgery for relief of pain. Saturday forenoon was a general farewell meeting, where Pierce Bailey, of Washington, D. C., discussed "Current Trends in Neurology in the U. S. A."

The morning sessions were well conducted and the subjects scientifically presented by outstanding men in their particular fields. On the afternoon programs there were seven to ten papers in each section, averaging about one hundred papers each afternoon. No time limit was kept on either the essayist or the discussor. As a result, there was considerable confusion during the afternoon sessions, and one could not rely on the time table of the program for any definite paper. One hundred and seventeen American neurologists presented papers of variable scientific value.

On Wednesday forenoon the entire group visited the Salpétriere Hospital. This is one of the most renowned neurological hospitals on the continent. In this hospital, in the 18th Century, Pinel, was the first physician to remove the chains from mental patients and treat them as sick human beings. In this same hospital, Charcot of the Charcot-joint fame, was able to hypnotize an entire ward full of patients at one time, because of his powerful personality and hypnotic influence.

On Tuesday evening, Dr. W. Penfield of Montreal, gave an excellent discussion on "Cerebral Localization of Function." These studies were made in the course of routine craniotomies on patients under local anesthesia, by direct stimulation of the cortex with electric currents. Among other things, he was able to demonstrate a secondary sensory representation in arms and legs on the superior lip and superior bank of the Fissure of Sylvius. On Thursday evening, Dr. Penfield gave another very stimulating address on "Localization and Clinical Classification in Focal Epilepsy." In the course of a craniotomy, he would attempt to localize the focal lesion by electrical stimulation which would initiate the convulsion. He then would surgically remove this particular area with any abnormal brain tissue or scar, with satisfactory results in some cases.

The Symposium on Encephalography was presented by Bremer of Brussels, Jasper of Montreal, and Hill of London. Their presentations were very conservative and emphasized the fact that electroencephalography should be considered only as a diagnostic aid, similar to other laboratory tests. The greatest value was in the diagnosis and investigation of the epilepsies, both essential and symptomatic. Second in importance is its aid in evaluation of the localization and severity of cerebral damage following traumatic head injuries. Next in importance is the diagnosis and localization of expanding intracranial lesions (tumors and abscesses) but only by competent and experienced personnel, using the most recently developed localization methods. Pneumoencephalography is still considered more accurate and more reliable. In cerebral vascular lesions and inflammatory and degenerative disorders, electro-encephalography is of questionable value.

The Tuesday forenoon discussion of the thalmus again demonstrated the specific functions of the various cells groups in the brain. One of the most important functions of some of these cells groups in the thalmus is that of sorting stations for the segregation and recombination of afferent impulses so as to form specific sensory patterns which are then referred to the cortex. This excellent symposium was presented by LeGros Clark of Oxford, Hess of Zurich, and two other French authors. Dr. Hess, later on, was given the Nobel Prize for his original contributions and studies.

The viral infections of the human nervous system were discussed by Sabin of Cincinnati, Hammond of San Francisco, Lepine of Montreal, and Gard of Stockholm. The classification of diseases and known viruses, in part, was as follows:

Viral Infections of the Human Nervous System

(Classification Based on Information Available in 1949)

A. DISEASES AND VIRUSES KNOWN.

I. Basic reservoir in human beings; worldwide in distribution.
    1. Sporadic and epidemic: poliomyelitis.
    2. Sporadic:
        mumps (parotitis)
        herpes simplex.
        lymphogranuloma venereum.

II. Basic reservoir extra-human; few widespread, most limited in distribution.
    1. Arthropod-borne encephalitides:
        St. Louis
        Western equine
        Eastern equine
        Venezuelan equine
        Japanese B.
        Russian tick-borne (Louping ill?).
    2. Transmitted by animal secretions or excreta:
        rabies
        lymphocytic choriomeningitis
        (pseudolymphocytic choriomeningitis?).
        B virus (monkey)

B. VIRUS ETIOLOGY POSSIBLE, BUT VIRUSES LITTLE KNOWN OR UNKNOWN.

Von Economo's encephalitis lethargica.
Herpes zoster
Australial "X" (may have been Japanese B).

C. DISEASES SOMETIMES GROUPED WITH VIRUS INFECTIONS WITHOUT ADEQUATE EVIDENCE.

Infectious polyneuritis (Guillain-Barré syndrome).
Postinfection and postvaccination (demyelinating) encephalitis: measles, varicella, rubella, vaccinia, variola, mumps, "influenza," et cetera.
Acute hemorrhagic encephalitis.

The Symposium on Neurosurgery for the relief of intractable pain was divided into the surgical section of pain tracts and pathways in the spinal cord for the relief of pain in the trunk and extremities, trigeminal tractotomy for trigeminal neuralgia, prefrontal leucotomy and topectomy by cutting the frontothalamic fibres. In an attempt to relieve severe attacks of migraine, Rowbotham of England, described some surgical precedures, such as excising or ligating various cranial blood vessels, with uncertain results and no definite conclusion. The entire meeting was very stimulating and it was interesting to see and meet some of the internationally famous neurologists and neurosurgeons.

The meeting was adjourned.

SOCIALIZED MEDICINE AS I SAW IT

(Continued from Page 162)

as a truly expert form filler and it is my sincere hope that one day I may be able to make some further use of this most doubtful acquisition.

I felt that I had had enough of this sort of government medicine and I made my decision to make a clean break—and I would make the same decision tomorrow. But I would urge you all to consider the implications for you and for all the people of this country in what I have said. The physicians of this country have the same hopes and the same ambitions as I have, the same hopes and ambitions which forced me to take the action that I took. Let us hope that none of them here are ever forced to make the same decision.

Insurance Economics, January, 1950

Minneapolis Surgical Society

Meeting of October 6, 1949

Ernest R. Anderson, M.D., Presiding

FRACTURE DISCOURSE

EARL C. HENRIKSON, M.D., MAYNARD C. NELSON, M.D., and DANIEL MOOS, M.D.

Minneapolis, Minnesota

Dr. Nelson: This talk of ours will deal with a few common fractures of the humerus. We would like it to be informal and invite you to participate in the discussion. By that I don't mean for you to wait until we finish talking. Interrupt us at any time. Don't save your comments.

As some of you may know, Dr. Henrikson, Dr. Moos and I have put on this conference, or whatever you want to call it, at various places throughout the state for the last two or three years. The idea for this method of presentation evolved from the Fracture X-Ray Conference held each week at the Minneapolis General Hospital. We first started to use it, and still do, in teaching the medical students at the University. I think it is quite a valuable teaching method. It is very informal, and so far at least, it has kept our listeners interested and kept us on our toes.

(*First slide*) This is the run-of-the-mill variety of supracondylar fracture of the elbow and is the most common of all elbow fractures in children. This fracture is, for the great part, extra-articular. I would think that 90 per cent of these fractures can be reduced by traction and manipulation and then the reduction maintained by one of several different methods depending on which one you favor. Personally, I like a posterior molded plaster splint. You may like something else. The methods of reduction differ in some respects. For instance, some men favor extending the arm and some even hyperextend the arm. I like to keep the arm in the position it is in when I first see the patient. This usually is about half way between a right angle and a straight line. Leave the arm in that positon and then apply traction so that you will not add to the injury of the soft parts.

(*Second slide*) In the arm shown in this slide there was a great deal of swelling. After the reduction was obtained, the elbow could be flexed only to 90 degrees, and when the swelling went down, the fracture slipped out of position as shown in this next slide.

(*Third slide*) This slide shows what happens to endanger the vessels in this fracture. The vessels and median nerve are underneath the fascia at the elbow. The distal fragment carries them back across the sharp edge of the proximal fragment. If you flex the arm without first bringing the distal fragment forward, you are apt to pinch the nerve and vessels.

(*Next slide*) Here is the re-reduction of the first fracture and shows now instead of the right angle position one of about 45 degrees of flexion. In this position the triceps is taut over the back of the elbow and so holds the small distal fragment in reduction.

Dr. Moos: What are the criteria of reduction of this fracture? How do you know whether there is reduction? What do you look for on the x-ray plate?

Dr. Nelson: The most valuable x-ray view is the lateral. If the articular surface of the humerus is about one-third anterior to a line dropped along the anterior aspect of the humerous, it is in the proper position.

Dr. Henrikson: How many times would you remanipulate it?

Dr. Nelson: That is an individual thing. For this particular fracture, I don't think it makes any difference. If the fracture is farther down towards the joint, I don't think you should manipulate more than once.

Dr. Moos: If you have a swollen elbow, how do you know how much flexion to put it in?

Dr. Nelson: You feel the radial pulse and flex the elbow as far as possible without obliterating the pulse, then immobilize it there. I use a posterior molded plaster splint to maintain this position. Thereafter the arm is closely observed and as the swelling decreases, you can increase the flexion of the elbow without endangering the radial pulse.

Dr. Moos: How long does it take this fracture to unite?

Dr. Nelson: It unites very rapidly. Usually after about ten days you can start active motion. Take it out of the splint several times a day for active exercises within the limits of pain. Union is quite solid after three or four weeks.

Dr. Henrikson: Do you put it in a sling?

Dr. Nelson: Yes, a sling or a collar and cuff strap apparatus.

(*Next slide*) This is a dicondylar or transcondylar fracture, the type that I don't think should be manipulated more than once.

Dr. Moos: What would you do with this fracture if you saw it and couldn't feel the pulse?

Dr. Nelson: Try to reduce it immediately by traction and manipulation.

Dr. Moos: What kind of anesthesia would you use?

Dr. Nelson: If the radial pulse is not palpable, I wouldn't use any.

Dr. Moos appeared by invitation.

Dr. Henrikson: Would you send the patient to the hospital?

Dr. Nelson: No, treat the patient immediately. You had better get busy right away, because this is a very serious complication.

Dr. Horace Scott: What anesthesia would you use in the hospital?

Dr. Nelson: This depends on the treatment you use. If you are going to manipulate this fracture, I think a general anesthetic is best.

Dr. Henrikson: Supposing the patient had just had supper. Would you do it then or wait until the next day?

Dr. Nelson: In some hospitals they pump the stomach. I wouldn't stop for that—use the anesthetic and let the patient vomit when he wakes up.

Dr. Lerner: Would you use skeletal traction?

Dr. Nelson: I have used it for this fracture in an adult but not in a child.

(*Next slide*) These are x-rays of the fracture just shown after it was placed in traction. You will notice it is slightly overpulled but reduction on the lateral film is pretty good.

(*Next slide*) This shows an x-ray taken a little farther along, about the time this case was ready to be taken out of traction and placed in a sling or splint.

Dr. Moos: It has been my observation that when I use traction in this type of fracture and get reduction but have some overpull, it takes longer for this fracture to heal.

Dr. Nelson: That has been my experience too. I remember one I had in traction with a little overpull. I treated it just like an ordinary case and at about five or six days took it out of traction and put a splint on and thought this would be all right. However, the x-ray showed that the fragments had slipped out of position and the patient had to be put back in traction. That patient was in traction eighteen days before union was solid enough so that a splint could be applied. The ordinary case you can take out of traction in five or six days.

(*Next slide*) This picture shows the type of traction we usually use for a child. The child is in bed with the edge of the bed raised a little bit for counter-traction. Stockinette is glued to the forearm with Ace adherent and forward pull on the distal fragment obtained as shown. There is a little pull backwards on the proximal fragment, the shaft of the humerus, by means of a felt sling which also is stuck to the skin with Ace adherent so that it won't shift.

Dr. Moos: How do you keep the patient from falling out of bed?

Dr. Nelson: The side of the bed is raised.

Dr. Moos: I think that's an important point. Sometimes all you need do to obtain reduction is to suspend the arm out from the side of the bed, if the side of the bed is raised.

(*Next slide*) Here is a closer view of this type of traction showing the stockinette extending up beyond the fingers to a spreader-block attached to the rope over the pulley.

Dr. Moos: Will placing this fracture in this type of traction reduce the fracture?

Dr. Nelson: Nearly so. I usually give these youngsters some sedative, then apply the traction and wait several hours, after which time most of them will be reduced. If not, give them a little more sedative and manipulate them right in the traction apparatus.

Dr. Moos: How many x-rays would you take in the first week?

Dr. Nelson: One every day for four days or so, and then the interval between check x-rays gradually increases.

Dr. Henrikson: Would you leave the arm in the same position while in traction or keep flexing the arm?

Dr. Nelson: I increase the flexion as the swelling goes down.

(*Next slide*) This view shows the spreader to which the stockinette is fastened.

Dr. Henrikson: We will now consider fractures higher up the humerus in various parts of the shaft. Here is a slide showing a slightly comminuted and slightly oblique fracture near the middle. There is no shortening so traction isn't needed except to keep the fragments in proper aligment.

You certainly don't need skeletal traction in a fracture of this type. You could use tape traction with the patient lying in bed. The arm would be abducted lying parallel to the top of the mattress. The forearm would be flexed at right angles to the arm with the fingers pointing to the ceiling. About 5 pounds attached to tapes applied to the arm would be adequate to keep the fragments in aligment. Tapes applied to the forearm extend up over the wrist to a pulley and a weight heavy enough to balance the forearm keeps it in comfortable position.

(*Next slide*) This shows the x-ray picture of the fracture at three and one-half weeks. You can see good callus already forming. At this time the arm can be placed in a sling or in a hanging cast. A sling will allow satisfactory motion at both the elbow and shoulder. Exercising of both joints is very important to prevent stiffness and muscular atrophy. If the patient is taught by the surgeon how to exercise, special physical therapy elsewhere would not be necessary.

Dr. Nelson: I always thought that fractures should be well immobilized—that the joint above and below the fracture should be stabilized.

Dr. Henrikson: Yes, in the not too distant past we would put patients like this in a big heavy body cast with the arm abducted, but lately the trend is to keep the shoulder moving. The fracture heals here in most cases in spite of the lack of fixation.

Dr. Moos: Well, I take exception. I grant you that in the humerus you can do that but—

Dr. Henrikson: You don't immobilize the elbow in Colles' fracture, the knee in Pott's fractures, the shoulder in supracondylar fractures in children, do you? Well, anyway here's the next slide showing a long spiral fracture rather high on the shaft. You could treat this one in bed just like we did the last one, but here we decided to use the hanging cast.

Dr. Nelson: Do you think a spiral fracture heals faster than an oblique?

Dr. Henrikson: It becomes stable faster because of the wider extent of the callus. Here you will notice in the next slide that using a hanging cast doesn't seem reasonable because the upper margin of the cast doesn't even extend over the upper part of the fracture.

Dr. Scott: Why wouldn't you do an open operation?

Dr. Henrikson: Most people and women especially don't want a scar on their arm. They all would like to avoid an operation if possible. Here because of interposed soft parts we finally had to operate.

Dr. Moos: Explain the surgical approach especially with regards to the radial nerve. What do you do with it?

Dr. Henrikson: To avoid the nerve we try to keep close to the bone with our instruments. Notice in this next slide what was done. The approach is anterolateral between the pectoralis major and deltoid muscles avoiding the cephalic vein along the margin of the deltoid. Continue downward along the lateral border of the biceps muscle to the brachioradialis muscle. Expose the brachialis muscle by retracting the deltoid laterally and the biceps medially. Then split the brachialis longitudinally all the way down through the periosteum to expose the bone. The radial nerve will be in the posterior half of the brachialis muscle, so retract carefully so as not to injure it. Free up only as much periosteum as is absolutely necessary to get at the fracture site. This next slide shows the site nicely exposed, a clamp holding the bones reduced, and holes being drilled for screws. You don't have to use a plate in a spiral fracture of this type, as four, five, or six screws alone will hold well. The next slide shows Collison screws being put in.

Dr. Moos: What about the cortices? Should the screw penetrate both cortices? Should the threads catch in the proximal as well as the distal cortex? What is the best way to put screws in?

Dr. Henrikson: The drill should be a size smaller than the screw and should go through both cortices. The screw threads should have good purchase in both cortices, the tip protruding all the way through the distal cortex.

Dr. Moos: Do you use a body cast after completing the operation?

Dr. Henrikson: No. All we do is apply a well-padded posterior molded splint from the wrist to the area over the scapula where it is fanned out rather widely. The arm is in the position it would be when in a sling, which is applied when the plaster is set. Tensor bandages are used to hold the splint on the extremity and the shoulder area. A few days later the plaster is removed, exercises of the shoulder and elbow are begun, and the cast and sling reapplied until next physical therapy period. The plaster mold is kept on between times for three or four weeks or until the callus looks firm.

Dr. Nelson: Would you suggest a sling all that time?

Dr. Henrikson: Yes.

Dr. Moos: What about special exercises for these patients?

Dr. Henrikson: While the splint and sling are off, the patients are taught to lean over as far as possible with the extremity hanging loosely downwards. Then in order to get good shoulder action they are told to aim the index finger at the floor and make large imaginary O's, X's, and figure-of-8's. They are told to flex and extend the elbow and to put the wrist and fingers through full ranges of motion many times daily. They are up and about the day after operation and home in a week.

Dr. Nelson: If this were associated with radial nerve paralysis, what would you do with the nerve? Explore it?

Dr. Henrikson: To what type of case do you refer? A compound fracture, a simple fracture with wrist drop or what? One should always examine the patient for signs of nerve injury such as weakness or paralysis or sensory changes.

Dr. Nelson: What would you do if such things were found?

Dr. Henrikson: If I were going to do an open reduction anyway, I would surely look to see if the nerve were actually cut, but wouldn't be too radical in my search for it if the findings didn't seem to indicate severance from the appearance of the muscle in which it lies. We have a patient up and around in the wards now whose transverse fracture of the humerus I plated several weeks ago. He had a wrist drop, but the brachialis and brachioradialis muscles weren't lacerated, and I could see no signs of a cut nerve on gingerly exploring the site. The injury to the nerve must have been only a contusion because function and sensation are returning nicely.

Dr. Moos: I agree with you. When you expose the bone, and the periosteum and muscle are intact, and you don't see the radial nerve in front of you, you can reasonably assume that the injury to the nerve was a contusion and will recover.

Dr. Culligan: Would you make the same incision if you had a radial nerve paralysis?

Dr. Henrikson: No, I wouldn"t. I would carry it down further over the brachioradialis, then search for it there and work upwards on it.

Dr. Hays: It is important to repair the radial nerve early.

Dr. Henrikson: What do you mean by early repair —immediate? Three weeks? Three months? You know that even just exposing the nerve at the time of open reduction will sometimes cause paralysis.

Dr. Hays: Well, that will come back.

Dr. Henrikson: Yes, that's the point. So will most of those associated with fractures, so shouldn't you wait a while in these cases to see if function won't come back? In compound fractures with nerve injuries, I think the tendency is to wait three weeks or so before suturing the nerve, although with penicillin, sulfas, streptomycin, et cetera, maybe we need not worry about infection as much as in the past. Some advise waiting three or four months. The longer you have to wait, the poorer your chances for a good result however.

Dr. Nelson: If you operate later rather than at once, you can work in a cleaner, drier field and get better hemostasis. I always thought that results in the repair of the radial nerve were pretty good, but that is not true in the repair of the median and ulnar nerves because they are associated with the finer motions.

Dr. Henrikson: Well the question as to when is the best time will take a long time to work out. Ten years from now we'll still be arguing about the same thing. Here is a slide showing another spiral fracture. This fracture was treated in a hanging cast. The next slides show the alignment to be good.

Dr. Moos: It is difficult to get a good lateral x-ray of the humerus when in a hanging cast.

Dr. Henrikson: This was taken through the chest with the uninjured arm raised and the injured arm against the plate. The following slides show how to correct displacements when using the hanging cast. For posterior angulation you lower the forearm by loosening the loop around the neck. For anterior angulation you raise the forearm by tightening the loop. For lateral angulation you place a large rubber sponge down by the elbow, while for medial angulation you place the sponge high up near the axilla. For shortening you tie a weight in the loop of plaster beneath the elbow. For over-pull you support the cast lightly in a sling. The sling will also correct the occasional tendency to subluxation of the shoulder joint.

The cast works best in the ambulatory patient in fractures in the lower two-thirds of the humerus including T and Y condylar fractures provided the articular surfaces are in good alignment.

The patient must be warned not to rest the cast on chair arms or pillows. At night the cast is hooked up to weights attached to the plaster loops to balance it in a comfortable position. The cast is removed in from four to eight weeks depending on whether callus is adequate to prevent displacement. A sling is used an additional four to eight weeks as needed.

Dr. Moos: I would like to present a simple method for handling fractures of the surgical and anatomical neck of the humerus which occur in the older age group. We feel that the primary purpose in treatment of these fractures in the patient who is over forty-five or fifty years of age is restoration of function and not complicated strenuous maneuvers designed to obtain good anatomical reduction of the fracture at the expense of soft tissue atrophy and ligamentous contracture. We know that practically all fractures in this region will unite almost regardless of what position they may be in. We also know that healing of these fractures in a relatively poor anatomical position is often commensurate with good function at the shoulder joint if normal ligament and muscular elasticity and tone are preserved. We also know that if you immobilize the shoulder of any individual in the older age group, varying amounts of limitation of motion at the shoulder joint will occur. We have all had the experience of seeing individuals develop almost complete limitation of motion at the shoulder joint when for one reason or another the arm was allowed to remain at the side for periods longer than ten days or two weeks.

About ten years ago at Minneapolis General Hospital a review of all cases of this type of fracture showed rather disappointing results in terms of function at the shoulder joint when the older individuals were considered. For that reason the time-honored methods of traction, abduction, airplane splints and even shoulder spicas were largely discarded in favor of a simple routine consisting of initial immobilization in a well-fitting Velpeau bandage which was allowed to remain in place only during the period of acute pain, extravasation of blood and muscular spasm. Depending upon the severity of the fracture, the immobilizing bandage was replaced by a sling with a small pillow between the elbow and chest wall in anywhere from three to ten days. At the same time physical therapy consisting of circumduction exercises with some radiant heat and light massage was encouraged. The exercise was increased in amount and duration rapidly. Care was employed not to allow pain to be produced by the maneuver and passive motion was strictly contraindicated. At about four weeks, in the average fracture, the sling was gradually discarded and the patient encouraged to begin active abduction exercises against gravity using the wall-ladder and shoulder-wheel. Again passive motion was strictly forbidden, and the yardstick of pain was used for measuring the amount of exercise permissible at any given stage. By the eighth week all limits were removed. We have been gratified to find that this program has greatly simplified handling this particular fracture and was followed by better and earlier return of function than when older, more conventional methods were employed.

(A series of slides were shown demonstrating a fracture of the surgical neck of the humerus, application of a Velpeau bandage, circumduction exercises and the use of the wall-ladder and shoulder-wheel.)

Dr. Nelson: How long would you immobilize a fracture of the surgical neck of the humerus in a person seventy years old?

Dr. Moos: Ten days or less, depending upon the initial severity of the acute reaction to injury.

Dr. Nelson: How many safety pins would you use to fix a Velpeau bandage in place?

Dr. Moos: At least twenty-five to thirty safety pins. If you do not use enough, the bandage will rapidly slip and defeat its purpose.

Dr. Culligan: When do you start motion in the average shoulder fracture?

Dr. Moos: The maximum period during which we allow the shoulder to be immobile is ten days. In the specific case the period depends on the patient, the type of fracture and the amount of hemorrhage. I would say the average is from seven to ten days.

Dr. Nelson: An important point in circumduction is that the patient should be made to understand that his arm be absolutely relaxed so that motion may actually occur at the shoulder joint and not be scapular. We tell these people to imagine that their hand is a stone and their arm is a string. Then they are encouraged to swing the stone as a pendulum. It is necessary to reassure the patient and relieve him of fear.

Dr. Henrikson: What would you do if you had a fracture through the anatomical neck from which the head was dislocated? Would you take it out?

Dr. Moos: I don't think so. By manipulation and the use of temporary skeletal traction a replacement of the head may often be effected. Even though the head might be upside down or in poor relation to the shaft, results by conservative treatment and early motion are as good in our hands as excision of the head. I would be inclined, however, to excise the head of the humerus if it remained in an extracapsular position unless some other contraindication existed.

Dr. Nelson: Will you explain the lateral x-ray view of the humerus?

Dr. Moos: This view is taken through the chest from the opposite axilla with the good arm abducted out of the way. As far as I am concerned this is the only view of the neck of the humerus in the lateral plane which one can readily interpret and get something out of.

Dr. Chisholm: What is your experience with the Kuntscher intramedullary nail?

Dr. Moos: At the present time we use it in fractures of the femoral shaft. We have not used it in fractures of the humerus. I have been pleasantly surprised in femoral fractures at the ease of insertion, solidity of fixation and the freedom of motion in the extremity which follows its use.

Dr. Nelson: There was an article or two in some recent literature recommending the Kuntscher nail fixation for pathological fractures. You have a case of pathological fracture in the femur now. Do you intend to use a Kuntscher nail?

Dr. Moos: Yes, I plan to use it as a palliative procedure. Pathological fractures in the femoral shaft are often very difficult to handle. I feel that with the use of an intramedullary nail these fractures can be made solid and the patient rendered much more comfortable by freeing them from necessity of bed rest, skeletal traction and a Thomas splint. Certain pathological fractures are associated with spasmodic muscular twitching. This is particularly troublesome, and the fracture can be well controlled by intramedullary fixation.

Dr. Scott: In fracture-dislocations of the elbow joint associated with fracture of the head of the radius with displacement, do you treat these conservatively or do you take the head of the radius out after the dislocation has been reduced?

Dr. Nelson: If the head of the radius is comminuted and the elbow dislocated, I think you should operate as soon as possible through an anterior incision, removing the radial head. All you have to cut is the skin because the lower end of the humerus has torn through the brachialis muscle and lies right under the skin. The wound should be well washed out with saline, and hemostasis should be complete. The dislocation should then be reduced and the operative wound closed. With that particular treatment you obtain a good result based on elbow motion in nine out of ten cases. If you go in laterally on this type of case, your result will be uniformly bad.

Dr. Scott: If the head of the radius is not comminuted but a greenstick fracture is present, what would you do?

Dr. Nelson: Usually you can reduce a greenstick fracture of the neck of the radius by thumb pressure. If this is unsuccessful, go in through a lateral incision and correct the deformity. Internal fixation is not necessary.

Dr. McGandy: Dr. Hays has had an interesting experience at Oak Ridge, Tennessee, concerning the use of radioactive material in healing of fractures.

Dr. Hays: I treated a man at Oak Ridge, Tennessee, who had a fracture of the femoral shaft and several fractures in the right forearm. These fractures were slow in healing. It was suggested to us that some radioactive material be administered parenterally. This was done and followed by astonishing results. The femur became quite solid within four weeks after the treatment was begun. Further experimentation on rabbits definitely demonstrated greatly increased rapidity of healing. In my case several days before the patient was ready to be discharged, jaundice occurred. It was the final opinion of the medical service that this may have been due to liver damage from the radioactive substance. For that reason no further use of the material has been carried out.

Dr. Scott: Have any bone sarcomas occurred?

Dr. Hays: Not to my knowledge.

Dr. Webb: *(Comments on American College of Surgeons movie concerning the treatment of fractures)* I first saw this film in Boston in January, and it was generally agreed that the plaster splint shown for Colles' fracture should be cut back to the proximal palmar crease in order to allow proper finger motion. I think the sugar-tong splint should be explained. When a Colles' fracture occurs which is unstable, it is necessary to get a firm hold of the carpals and metacarpals distally. Proximally the ulna is fixed. However, there is no control over the upper end of the radius unless pronation and supination are prevented by carrying a sugar-tong plaster around the elbow joint.

Dr. Chisholm: Some interesting work at the Peter Bent Brigham Hospital has been done by Drs. Ward and Swanson who have been studying fractures for several years. They fractured rabbits' and dogs' legs and removed some of the fracture hematoma, from which a phosphatase concentrate was made. When this was instilled into other experimental fractures, acceleration of union was noted. I believe that it has already been used in a number of adult humeral shaft fractures with good result.

ASSOCIATED DISEASES OF THE SKIN AND EYE

(Continued from Page 153)

Summary

Some of the more interesting diseases that have common ophthalmologic and dermatologic findings have been presented. Those conditions associated with systemic diseases, such as syphilis and tuberculosis, and the endocrine and metabolic disturbances have been omitted, since a discussion of these subjects is beyond the scope of this paper.

RESEARCH IN THE SERVICE OF MEDICINE

◆ Reports and Announcements ◆

PRIZE ESSAY AWARD

The Board of Regents of the American College of Chest Physicians offers a cash prize award of $250 to be given annually for the best original contribution, preferably by a young investigator, on any phase relating to chest disease.

The prize is open to contestants of foreign countries as well as those residing in the United States. The winning contribution will be selected by a board of impartial judges, and the first award will be made at the forthcoming annual meeting of the College to be held in San Francisco, June 22 to 25, 1950.

The College reserves the right to invite the winner to present his contribution at the annual meeting, and to publish the essay in its official publication *Diseases of the Chest.* Contestants are advised to study the format of *Diseases of the Chest* as to the length, form and arrangement of illustrations to guide them in the preparation of the manuscript.

The folllowing conditions must be observed:

1. Five copies of the manuscript, typewritten in English, should be submitted to the office of the American College of Chest Physicians not later than May 1, 1950.
2. The only means of identification of the author or authors shall be a motto or other device on the title page and a sealed envelope, bearing the same motto on the outside, enclosing the name of the author or authors.

Additional information may be obtained from the executive secretary of the College, 500 North Dearborn Street, Chicago 10, Illinois.

AMERICAN GOITER ASSOCIATION

The American Goiter Association will hold a meeting in the Shamrock Hotel, Houston, Texas, March 9, 10 and 11, 1950.

The program for the three-day meeting will consist of dry clinics, demonstrations, and papers dealing with goiter and other diseases of the thyroid gland.

INDUSTRIAL HEALTH CONFERENCE

The thirty-fifth annual conference of the American Association of Industrial Physicians and Surgeons will be held with four other groups—the American Conference of Governmental Industrial Hygienists, the American Association of Industrial Nurses, and the American Association of Industrial Dentists, at the Sherman Hotel, Chicago, April 22-29, 1950.

More than 100 papers will be read at the eight-day meeting, which will be the nature of a postgraduate course. Some of the subjects to be discussed will be: toxic effects of materials used in industry, accident hazards, treatment of injuries, interpretation of x-rays in industrial cases.

Additional information may be obtained from Dr. F. W. Slobe, 425 North Michigan Avenue, Chicago, Illinois.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

A special meeting of the Minnesota Society of Neurology and Psychiatry was at the Town and Country Club in Saint Paul on February 7. Dr. A. Earl Walker, professor of neurological surgery, Johns Hopkins University, was the guest speaker. He addressed the society upon the subject, "Posttraumatic Epilepsy."

E. STARR JUDD LECTURE

The seventeenth E. Starr Judd Lecture was given by Dr. Henry K. Beecher, Dorr Professor of Research in Anesthesia, Harvard Medical School, on February 16 at the University of Minnesota. Doctor Beecher's subject was "Growth in the Field of Anesthesia: Some Problems in the Control of Pain."

The late E. Starr Judd, an alumnus of the Medical School of the University of Minnesota, established this annual lectureship in Surgery a few years before his death.

CONTINUATION COURSES

Gastrointestinal Diseases.—A continuation course in gastrointestinal diseases will be presented at the Center for Continuation Study of the University of Minnesota on March 6 to 8. The course is intended for general physicians and will emphasize the diagnosis and management of disorders of the gastrointestinal tract.

Among the subjects to be considered in the course will be a symposium on peptic ulcer, a discussion of the functional bowel syndrome, and the psychosomatic aspects of the gastrointestinal disorders, the x-ray diagnosis of gastrointestinal diseases, and a clinic on gastrointestinal disorders in pediatrics. Faculty for the course will include clinical and full-time members of the University of Minnesota Medical School and the Mayo Foundation.

Pediatrics.—The University of Minnesota announces a continuation course in pediatrics on April 10 to 12. This course, which will be presented at the Center for Continuation Study, is intended for physicians specializing in pediatrics and will be devoted to disorders of metabolism and endocrine function.

Distinguished visiting physicians who will participate as faculty members for the course are Dr. Daniel C. Darrow, Yale University School of Medicine, and Dr. George M. Guest, Children's Hospital, Cincinnati, Ohio. The remainder of the faculty for the course will be made up of clinical and fulltime members of the staff of the University of Minnesota Medical School and the Mayo Foundation.

Neurologic Center of Glenwood Hills Hospitals to be ready for service soon

The Center Will Have Complete Facilities For:

1) treatment of the hemiplegic patient
2) multiple sclerosis
3) retraining of speech disorders
4) paraplegia and other paralyses
5) ataxias

GLENWOOD HILLS HOSPITALS

3901 GOLDEN VALLEY ROAD • MINNEAPOLIS 22, MINNESOTA

Offering a High Standard of Facilities for 25 Years

CONTINUATION COURSES

(Continued from Page 192)

Symposium on Hypertension.—The University of Minnesota announces a symposium on Hypertension to be presented on the campus of the University of Minnesota on September 18 to 20 in honor of Dr. Elexious T. Bell, Dr. Benjamin J. Clawson, and Dr. George E. Fahr. Dr. Bell and Dr. Clawson retired from the department of pathology in June, 1949, and Dr. Fahr will retire in June, 1950, from the department of medicine.

A symposium on hypertension in honor of these men is appropriate since all three have had special interest in this disease. The symposium will bring to the University distinguished scientists from the United States and broad. Support for the symposium has been provided by the Variety Club, the Mayo Foundation and the University of Minnesota. All interested physicians will be welcome to attend.

BLUE EARTH COUNTY SOCIETY

At the annual meeting of the Blue Earth County Medical Society in Mankato, Dr. A. A. Schmitz was elected president of the organization.. Other officers named were Dr. R. W. Kearney, vice president, and Dr. O. H. Jones, secretary. All three officers are from Mankato.

CLAY-BECKER COUNTY SOCIETY

Dr. Allen Moe, Moorhead, was elected president of the Clay-Becker County Medical Society at its meeting in Moorhead on December 9. Dr. Arnold Larson, Detroit Lakes, was named vice president, and Dr. L. H. Flancher, Lake Park, secretary-treasurer.

Principal speakers at the meeting were Dr. Lyle French, Minneapolis, and Dr. F. C. Jacobson, Duluth.

FREEBORN COUNTY SOCIETY

Elected president of the Freeborn County Medical Society, at its meeting in Albert Lea on December 17, was Dr. M. O. Nesheim of Emmons. Other officers elected included Dr. C. E. J. Nelson, vice president; Dr. E. S. Palmerton, secretary, and Dr. R. A. Demo, treasurer.

RED RIVER VALLEY SOCIETY

At the annual meeting of the Red River Valley Medical Society in Crookston on December 9, Dr. Kenneth W. Covey of Mahnomen was elected president, to succeed Dr. George Sather, Fosston. Elected vice president was Dr. Donald E. Pohl, Crookston, and reelected as secretary-treasurer was Dr. R. O. Sather, Crookston.

ST. LOUIS COUNTY SOCIETY

At the annual meeting of the St. Louis County Medical Society in Duluth on December 8, Dr. O. L. McHaffie, Duluth, was named president-elect of the organization, to take office in 1951.

Dr. L. R. Gowan, Duluth, will serve as president during 1950. Dr. J. A. Malmstrom, Virginia, is the vice president for 1950, and Dr. C. H. Christensen, Duluth, is secretary-treasurer.

STEARNS-BENTON COUNTY SOCIETY

The January meeting of the Stearns-Benton County Medical Society was held in St. Cloud on January 19. The principal feature of the scientific program was a symposium on "Fractures of the Upper and Lower Extremities" presented by Dr. Maynard C. Nelson, Dr. Daniel J. Moos, and Dr. Earl C. Henrickson, all of Minneapolis.

WINONA COUNTY SOCIETY

Dr. H. J. Roemer, Winona, was elected president of the Winona County Medical Society at its annual meeting in Winona on January 9. Dr. Roemer succeeds Dr. F. J. Vollmer, Winona, in the office.

Other officers elected include Dr. Fred Roth, Lewiston, vice president; Dr. Hilmar Schmidt, Winona, secretary, and Dr. Philip Heise, Winona, treasurer. The latter two were re-elected to office.

As a result of intensive studies during the past few years, evidence has accumulated which suggests that histoplasmosis—formerly believed to be a rare and usually fatal disease—also exists as a mild asymptomatic syndrome which is very prevalent in certain parts of the world. Although quite typical cases of clinical histoplasmosis are probably much more frequent than previously thought, the principal significance of the asymptomatic form is that in certain respects the disease so closely resembles tuberculosis as to be frequently confused with it.—MICHAEL L. FURCOLOW, M.D., *Pub. Health Rep.*, November, 1949.

TAKE THAT WINTER VACATION

Now!

FLY TO BEAUTIFUL

ACAPULCO AND MEXICO CITY

Special fun-filled excursion trips from the Twin Cities to sunny Acapulco and Mexico City aboard a luxurious 28-passenger multi-engined DC-3. Spend five, seven or ten glorious days bathing, sunning, sight-seeing or landing the big ones in the world's most famous deep sea fishing waters.

These are personally conducted tours but your time is your own. All reservations, including hotels, meals and side trips will be made for you if you desire. Total cost of round trip transportation per person is only $137.50 (plus $2.10 for Mexican tourist visa). Hotel accommodations in the finest hotels will cost approximately $8.00 per day including meals.

Call or write immediately for further information. Flights are still scheduled for March but they are filling fast so get your reservation in early.

✦ Woman's Auxiliary ✦

UNIT PLANS FOR COMING YEAR

Mrs. R. J. Dittrich

Having arrived at the mid-point of their 1949-50 period of activity, members of the St. Louis County Medical Auxiliary feel they can look back on a successful first half, with more important plans for the future.

The first social event of the year was a tea planned by Mrs. S. N. Litman and held in the home of Mrs. L. R. Gowan. The Auxiliary entertained the wives of new doctors, residents and interns and also honored past presidents.

The Duluth group exceeded their quota by almost one hundred dollars at the annual rummage sale in October. Mrs. L. R. Gowan and Mrs. A. O. Swenson acted as chairman and co-chairman.

Instead of the usual White Elephant party, the Social Committee entertained the members with a Social Day at the regular meeting in November. Homemade cakes and preserves were raffled and the proceeds were added to the philanthropic fund.

At the December Board meeting, called by the president, Mrs. John K. Butler, the Auxiliary focused its attention on the serious problems that concern doctors' wives these days.

Beginning with the January 10 meeting at the Kitchi Gammi Club, the Auxiliary started with a study group at 11:30 a.m. This was patterned after the plan of the state workshop which was held in Minneapolis last fall. Dr. A. O. Swenson directed and acquainted them with the current problems of medicine, and two members led the discussion which followed. Mrs. G. A. Hedberg and Mrs. Karl E. Johnson were moderators for the month of January. At 12:30 luncheon was served, during which a résumé of what had been learned at the study period was presented.

At 1:30 the regular formal program took place which featured a talk on interior decorating by John Wendell Engstrom.

The annual dinner dance was given at the Kitchi Gammi Club, on January 28.

Mrs. R. H. LaBree and Mrs. F. T. Becker have charge of the program for the remainder of the year.

On Education Board

Mrs. Anderson C. Hilding, Duluth, member of the Woman's Auxiliary to the St. Louis County Medical Society, was appointed by Governor Luther W. Youngdahl to serve a five-year term on the State Board of Education.

Mrs. Hilding is a graduate of the University of Minnesota. The wife of Dr. Anderson C. Hilding, Duluth, she is the mother of five children.

NEW OFFICERS ELECTED

Mrs. C. W. Moberg

Mrs. James Oliver, Moorhead, was elected president of the Woman's Auxiliary to the Clay-Becker Medical Society for the coming year. Mrs. Thomas Buisclair, Detroit Lakes, was elected secretary-treasurer. Mrs. C. W. Moberg, Detroit Lakes, is the retiring president.

The Christmas sale held at the December meeting was a success. Proceeds were given to the patients of the Sand Beach Sanitarium to be used as spending money.

GROUP STUDIES BY-LAWS

Mrs. J. F. Norman

A set of revised by-laws was presented to the Red River Valley Medical Society Auxiliary at the meeting of December 9, 1949. Voting on the by-laws will be held at the annual meeting in the spring. Mrs. C. L. Oppegaard and Mrs. J. F. Norman presented the by-laws.

The club met at the home of Mrs. W. F. Mercil, Crookston.

Mrs. Oppegaard discussed a pamphlet on compulsory health insurance, "The Voluntary Way is the American Way."

New members include: Mrs. R. R. Hendrickson and Mrs. D. E. Pohl. Mrs. C. M. Adkins of Thief River Falls was an out-of-town guest.

AT YOUR CONVENIENCE, DOCTOR . . .

you are cordially invited to visit our new and modern prescription pharmacy located on the street floor of the Foshay Tower, 100 South Ninth Street.

In Memoriam

THAYER CLINTON DAVIS

Dr. Thayer C. Davis of Wadena passed away on November 17, 1949, at the age of sixty-two. He suffered from an attack of coronary thrombosis on July 20, 1942, which had restricted his activities in recent years.

Dr. Davis was born at Howard Lake, Minnesota, May 5, 1887. He graduated from the University of Minnesota Medical School in 1913 and interned at the City and County Hospital in Saint Paul. He practiced at Warroad, Minnesota, from 1914 to 1918 and at Glenwood from 1918 to 1922.

As an undergraduate he was a member of Alpha Omega Alpha and while residing in Wadena belonged to the Upper Mississippi Medical Society, the Minnesota State and American Medical Associations. He was active in civic affairs and was president of the First National Bank of Wadena.

Dr. Davis is survived by his wife; two sons, Dr. Thayer Davis, Jr., of Beaver Dam, Wisconsin, and Robert Davis of Cheyenne, North Dakota; and a brother, Dr. Thomas L. Davis of Wadena, with whom he had been associated in practice.

JOHN CHARNLEY McKINLEY

Dr. J. C. McKinley, formerly Professor of Neuropsychiatry and head of the Department of Medicine at the University of Minnesota Medical School, died following an illness of several years' duration, January 3, 1950.

John Charnley McKinley was born in Duluth, November 8, 1891. He attended West High School in Minneapolis and later the Horace Mann High School in New York City.

He attended the University of Minnesota where he obtained the degrees of B.S. in 1915, M.A. in 1917, M.D. in 1919, and Ph.D. in 1921. Five years of postgraduate study in anatomy and neuropsychiatry were taken at the university. He acquired membership in the societies of Sigma Xi and Alpha Omega Alpha during his student days.

Among other appointments, Dr. McKinley was secretary-treasurer of the Minnesota State Board of Examiners in the Basic Sciences. Neuropsychiatry was Dr. McKinley's special field and he held a professorship in this field at his Alma Mater.

The family's reaction and attitudes toward the patient's tuberculosis can have a decided effect upon the progress of his treatment. The members of the family, as well as the patient, need education as to the meaning of the disease and must be particularly aware of their role in enabling the patient to remain in the hospital until treatment is completed.—William B. Tollen, Ph.D., *VA Pamphlet 10-27*, October, 1948.

When little patients act MULISH...

Try *Dulcet* Penicillin Tablets—appealing, candy-like cubes that pack the therapeutic potency of 50,000 units of penicillin G potassium (buffered with 0.25 Gm. calcium carbonate). Stable indefinitely, cinnamon-flavored *Dulcet* Tablets possess the same antibiotic action as an equal unitage of penicillin in unflavored tablets. Although designed for easing the administration of oral penicillin to children, *Dulcet* Tablets are preferred by many adults who simply wish to avoid unpleasant tasting medicine. *Dulcet* Penicillin Potassium Buffered Tablets are available at pharmacies everywhere—in bottles of 12. For literature, write to ABBOTT LABORATORIES, North Chicago, Illinois.

◆ Of General Interest ◆

The treatment of herpes zoster in the past has been symptomatic and has consisted largely of pain-killers. On the whole it has been highly unsatisfactory.

For the benefit of readers who failed to see the report by Binder and Stubbs of the dramatic results obtained with aureomycin in the treatment of four cases of herpes zoster, we mention their findings: Aureomycin, in 500 mg. doses every six hours for two days, caused marked relief from pain within twenty-four hours in three of the four patients and moderate relief in the fourth.

The trial of this new "wonder-drug" for this painful affliction would seem well worth while.

* * *

Dr. Richard W. Maertz, after practicing in Goodhue for several years, has moved to Faribault and opened offices in the Security Bank Building.

* * *

In New Prague, **Dr. Charles F. Cervenka** has moved his offices into a new medical-dental office building. Construction of the one-story building, which was erected by Dr. Cervenka and Martin A. Rathmanner, D.D.S., was completed last August.

Dr. Cervenka was graduated from the University of Minnesota Medical School in 1927. Associated with him in practice at New Prague is Dr. E. M. Doherty, a graduate of Marquette University School of Medicine.

* * *

Dr. Paul R. Hawley has resigned as chief executive officer of the Blue Cross and Blue Shield Commissions to become director of the American College of Surgeons, effective March 1. No one has yet been named to succeed him. Dr. Malcolm MacEachern will become director emeritus of the American College of Surgeons, will continue to head the hospital standardization program and will assist with other special activities.

* * *

Dr. George N. Kraemer, who was formerly associated in practice with Dr. L. J. Monson of Canby, is now located in Minneapolis where he is taking postgraduate training under a surgical fellowship.

* * *

The University of Minnesota J. B. Johnston Lecture in Neurology was given on January 31 by **Dr. Theodore B. Rasmussen,** professor of surgery and chief of the division of neurosurgery at the University of Chicago. The title of his address was "Cortical Localization." Dr. Rasmussen is the first University of Minnesota Medical School graduate to give the Johnston Lecture, which is presented annually in honor of the former professor of neurology and dean of the College of Science, Literature and the Arts at the University.

Office nurses are available through the Professional Counseling and Placement Service of the Minnesota Nurses' Association, at no charge to nurse or employer. References are assembled on all registrants. Further information may be obtained by writing to the Minnesota Nurses' Association, 2395 University Avenue, Saint Paul 4, or by calling NEstor 4807.

* * *

"Cutaneous Cancer" was the title of an address presented by **Dr. Henry E. Michelson,** Minneapolis, at the second annual Mid-West Cancer Conference in Witchita, Kansas, on January 19.

* * *

The motion picture **"Be Your Age,"** presented by the Metropolitan Life Insurance Company and the American Heart Association, depicting facts about the heart and heart disease, should be valuable in the education of the public. It provides excellent educational material by showing, for example, the response of the heart to strenuous exercise in youth as compared to that in older age groups, and by pointing out the favorable results from proper restriction of activities by persons suffering from heart impairment.

* * *

Fishermen's College.—The following article, about a member of the Minnesota State Medical Association, appeared in a recent issue of the *Medical Pocket Quarterly* and is reprinted here since it definitely seems to be "of general interest."

Fishermen—Take Notice

Dr. Herman Linde, Minneapolis Coll. P. & S. '05, of Cyrus, Minn., is not only a most competent physician, but is the head of the first and only Fishermen's College in the world.

Dr. Linde, dean of the institution, got the idea for such a college in 1939. He said that during hard times people were doing everything for everybody except the poor fisherman. "He was a forgotten man." So he started to do something about it. He founded this college which now has 1,568 members. Its diploma reads: "This certifies that (blank) is thoroughly educated in the art and science of fishing and that he has a profound knowledge of scientific ichthyology and piscatorial metaphysics . . ."

One unique feature is that the Fishermen's College confers the degree of Doctor Piscator, summa cum laude, before the examination is held. And there is a reason. Some of the questions are—"How long can a whale hold his breath under water?" "Did your great grandma ever go angling?" "Define piscatorial psychosis." "Does a New Dealer catch more fish than a Republican?" "How many scales has a 2,500 lb. devil fish?" "On what day did God create the fishes?" et cetera. There are thirty-eight questions, winding up with "What is a straight fish line?" He asks that the answers "possess clarified conciseness, a compacted comprehensibleness, a coalescent consistency, and a concentrated cogency."

One interesting thing about the college is that a graduate is sure to get a diploma, which is similar to the

diplomas of educational institutions and signed by the professors in various departments, which are "Bigger and better fish," "Original fish stories," "How to avoid the game warden," and "Piscatorial prognostication" and several others.

A man who sends a dollar to Dr. Linde with the request to join the institution will receive the diploma with the degree, and can let his conscience be his guide about answering the questions.

Among the graduates are McKenzie King, late Premier of Canada, Secretary of State Dean Acheson Governors George T. Mickelson of South Dakota; Val Peterson of Nebraska and Youngdahl of Minnesota; King Haakon of Norway, as Dr. Linde was born in Norway, and a great number of other dignitaries.

At the last banquet 260 people were present and Governor Youngdahl was the speaker.

* * *

Dr. F. W. Wittich, Minneapolis, presented a paper entitled "The Influence of Antihistamine Agents on Passive Transfer Wheals" at a meeting of the American College of Allergists in St. Louis on January 16, 17 and 18.

* * *

An institute to explore the application of new techniques of information services to the **field of health education** was held at the University of Minnesota Center for Continuation Study on January 12 and 13. The institute was presented in co-operation with the University School of Public Health, the Audio-visual Education Service, the School of Journalism and the Minnesota Department of Health.

Among Minnesota physicians attending a postgraduate course on diseases of the blood, held at the Medical College of Alabama early in December and sponsored by the American College of Physicians, were **Dr. Bernhard J. Cronwell, Jr.,** Austin, and **Dr. Donald C. Campbell,** Rochester.

* * *

Dr. Robert B. Engstrom, formerly of Minneapolis, has opened offices for the practice of medicine in Mankato. A graduate of the University of Illinois College of Medicine in 1939, Dr. Engstrom served his internship and a surgical residency at St. Luke's Hospital, Chicago. He then conducted a general practice in Michigan City, Indiana, for three years, after which he moved to Minneapolis and became associated with the Nicollet Clinic for four years. He has taken postgraduate work at the University of Minnesota.

* * *

It was announced in December that **Dr. W. J. Hruza** of Minneapolis planned to move to Madelia to become associated in practice with Dr. H. E. Coulter of that city. A graduate of the University of Minnesota Medical School in 1943, Dr. Hruza served in the Navy for two years during World War II. For the past three years he has been a surgical resident at Swedish Hospital, Minneapolis.

* * *

A bequest of almost **one-half million dollars** was presented to the University of Minnesota on December 23 to be used for medical research. The bequest was from the estate of the late Silas McClure, Minneapolis businessman who died on February 16, 1949. Total value of the bequest was $482,304. Mr. McClure, who had previously given other medical research funds to the University, was the originator of the Monarch kitchen range and until his retirement in 1944 was president of the Electric Machinery Manufacturing Company, Minneapolis.

* * *

Dr. D. O. Osborn has become associated in practice with Dr. Oliver W. Roberts in Owatonna. A graduate of the University of Nebraska, Dr. Osborn interned at Grace Hospital, Detroit, Michigan. He has practiced medicine at Omaha, Nebraska, and has served in the Army for the past two years.

* * *

In the middle of December, **Dr. and Mrs. Oliver W. Anderson,** of Luverne, and their two sons left for a one-month vacation trip through the southern part of the United States.

* * *

Dr. Jermyn F. McCahan, medical director of Bausch & Lomb Optical Company since 1941, has been named assistant to Dr. Carl M. Peterson, secretary of the AMA Council on Industrial Health. In his new assignment Dr. McCahan will travel extensively, visiting numerous industries throughout the United States.

THE FOURTH OF A SERIES

We are using the opportunity afforded by the advertising facilities of Minnesota Medicine to discuss Municipal securities for investment of your savings.

Investors usually buy municipal securities for safety, steady and tax free income, and very seldom trade or sell. Generally there is no listed market on Municipals since there is no continuing supply of particular issues except a few of the larger municipalities such as New York City, Philadelphia, Los Angeles, etc., where a floating supply is usually available. It is in the nature of an unlisted market and while not generally known, daily volume in Municipal trading and selling exceeds that of corporate bond trading on the New York Stock Exchange. We make bids or furnish appraisal prices on any municipal securities.

Prices and yields for municipal bonds are based on the general condition of the money market, the length of time to maturity, geographical location and other factors. It is our established policy never to sell a municipal security to our clients which under similar personal financial conditions any one of us would not buy for our own investment. Our offering circulars are prepared giving detailed information on all securities offered.

* * *

Emergency diphtheria immunization clinics were set up at two Minneapolis schools on January 18 by Minneapolis Health Department and school officials. It was announced by Dr. F. J. Hill, commissioner of health, that thirty-two of the thirty-nine cases of diphtheria in the city from January 15, 1949, to January 15, 1950, occurred in the area in which the two schools are located. Dr. Hill stated that the deaths of two children in the previous week were "needless" and that diphtheria could be almost entirely prevented through immunization. Parents were urged to bring preschool children to the clinics and to sign release forms for school children to permit immunization.

* * *

Dr. L. McKenzie Gross, formerly of Provo, Utah, has become a staff member of the Fergus Falls State Hospital. A graduate of the University of Tennessee Medical School, Dr. Gross has been associated with two state hospitals in Tennessee as well as one in Provo.

C. F. ANDERSON CO., Inc.
Surgical and Hospital Equipment
901 MARQUETTE AVENUE MINNEAPOLIS 2, MINNESOTA

It was announced on December 16 that **Dr. A. D. Hoidale**, a practitioner in Tracy for forty-five years, had sold his interest and equipment at the Tracy Medical Clinic to Dr. Lyle M. Benson of that city. As a result Dr. Benson became the new partner of Dr. W. G. Workman in the clinic.

Dr. Hoidale, however, continues to own jointly with Dr. Workman the clinic's hospital building, where he intends to maintain his practice in the future, occasionally relieving Dr. Benson and Dr. Workman at the clinic.

Immediately after the announcement of the transaction, Dr. and Mrs. Hoidale left for Tucson, Arizona, where they planned to spend the winter.

* * *

During 1949, Health District 5, comprising thirteen counties, lost nine practicing physicians, **Dr. Helen B. Wolff** of Worthington, district director, reported early in January. That left one physician for every 1,700 persons, as compared with 1,600 in 1948. The proportion varied from one physician per 2,800 persons in Redwood County to one per 1,200 in Yellow Medicine County.

Dentists remained practically constant in number, with an average ratio of one per 1,850 persons. The range, however, extended from one dentist per 5,020 persons in Murray County to one per 1,438 in Lyon County.

With only ten of the thirteen counties in the district reporting on the availability of nurses, registered nurses decreased during the past year by fourteen, and practical nurses gained by fifty-five. Full-time public health personnel in the district rose from fifteen in 1948 to 23 in 1949.

* * *

Dr. Robert D. Semsch, Minneapolis, has been reappointed Hennepin County physician for 1950.

* * *

Litchfield acquired another physician on January 1 when **Dr. Wayne A. Chadbourn** became associated in practice with Dr. Harold E. Wilmot, Dr. Cecil A. Wilmot and Dr. Donald E. Dille of Litchfield. A graduate of the University of Minnesota Medical School in 1943, Dr. Chadbourn served overseas in the Army during World War II. Following his term of service, he took postgraduate work at the University of Minnesota and at Abbott Hospital, Minneapolis.

* * *

Construction of a one-story medical office building began in Grand Rapids early in January. Owners of the new structure will be **Dr. Gordon M. Erskine** and **Dr. Clarence R. Ferrell**, whose offices were destroyed in a recent fire. Completion of the building is expected during March.

* * *

Retirement of **Dr. Brand A. Leopard**, Albert Lea, was announced in December. After practicing in Albert Lea for eighteen years, Dr. Leopard planned to retire in March or April and move to his home in Brownsville, Texas.

A graduate of the University of Minnesota, Dr. Leopard began his medical practice in New Richland. Later he took postgraduate work in surgery at the University of Pennsylvania, then practiced as a group surgeon in Evanston, Illinois. Eighteen years ago he moved to Albert Lea, where he has since practiced. Always civic minded, he has been a member of numerous city, medical and fraternal organizations. His retirement is caused by ill health.

* * *

Specialized training in psychiatry will be given to Minnesota mental hospital physicians, Governor Luther Youngdahl announced on January 6. The state physicians will receive a week of training at the Mayo Clinic's psychiatric section in Rochester. Credit for paving the way for the program was given to Dr. Francis J. Braceland, head of the psychiatric section of the Mayo Clinic and co-consultant in psychiatry to the Minnesota Division of Public Instruction.

* * *

Dr. Harold C. Habein, of the section on internal medicine of the Mayo Clinic, Rochester, was married on December 23 to Mrs. Margaret H. Webb of Wabasha.

* * *

"The Pathologist and Law Enforcement" was the title of a talk given by **Dr. Arthur H. Wells,** Duluth, at a meeting of the Exchange Club in Duluth on January 4.

Dr. Donald M. Houston has been chosen as the Park Rapids school physician for the present school year. The office is a new service in Park Rapids, where it is planned to have the position rotate among the local physicians, each serving one year.

* * *

A mass chest x-ray survey will be held in **Mower County** starting in March. The survey will last nine weeks and will be conducted by technicians from the Minnesota Department of Health in two mobile x-ray units.

* * *

January 1, 1950, marked the fiftieth wedding anniversary of **Dr. and Mrs. Arthur E. Benjamin** of Minneapolis. The physician and his wife celebrated the event at a dinner attended by their four children, among them Dr. Harold G. Benjamin and Dr. Edwin G. Benjamin, both of Minneapolis.

* * *

Among Minnesota physicians who attended a continuation course in obstetrics at the University of Minnesota in the middle of December were Dr. Bernice Thoresen, South Saint Paul; Dr. Peter J. Kitzberger, New Ulm, and Dr. Robert A. Murray, Hibbing.

* * *

A total of 110 physicians, dentists and nurses attended the final meeting on December 14 of the eight-week seminar on heart disease, cancer and psychosomatic medicine held in Fergus Falls. The principal speaker at the last of the weekly meetings was **Dr. Roger Howell**, associate professor of neuro-

psychiatry at the University of Minnesota Medical School.

* * *

Work on a new medical clinic building in Oklee was nearing completion early in January, and it was expected that the structure would be ready for operation by the end of the month. In the meantime **Dr. F. L. Behling,** newly arrived physician in the village, was using his residence as a temporary office. The clinic building was financed by donations from local businessmen, farmers and the village. Total cost for the building and equipment was estimated at $33,000.

* * *

Early in January **Dr. Henry Van Meier** of Stillwater attended a course on cardiovascular diseases at the University of Minnesota Center for Continuation Study.

* * *

Dr. John S. Lundy, chief of the section on anesthesiology at the Mayo Clinic, was honored on December 4 at a dinner in Rochester on his twenty-fifth anniversary in Rochester. More than 100 persons, many of them former associates who returned to Rochester for the event, attended the affair. Dr. Ralph Knight, Minneapolis, presented Dr. Lundy with a silver tray inscribed with the names of more than 250 of his former students. Said Dr. Knight: "The tray is a memento of our gratified feeling for the wisdom we received from you over a period of twenty-five years."

Dr. George L. Loomis, Winona, presented a paper at the meeting of the Minnesota Academy of Ophthalmology and Otolaryngology in Saint Paul on December 9. Dr. Loomis discussed the histamine treatment of Bell's palsy.

* * *

"Foundations for Better Health and Physical Fitness" was the title of a talk presented by **Dr. Ralph J. Eckman,** Duluth, at a meeting of the Parent-Teachers Association at Jefferson School in Duluth on December 13.

* * *

Dr. Leo G. Rigler, director and professor of radiology and physical medicine at the University of Minnesota, has been named national vice president of the American Friends of the Hebrew University.

* * *

Minnesota's new mental health commissioner is **Dr. Ralph Rossen,** superintendent of the Hastings State Hospital for many years. Announcement of his appointment to the newly created post, which became effective on January 1, was made on December 15 by Governor Luther Youngdahl, who issued a two-page tribute praising the abilities and qualifications of the physician. Selection of Dr. Rossen was made by the governor and a professional advisory committee of physicians.

* * *

Dr. O. L. Peterson of Cokato was honored at ceremonies held in the Cokato school auditorium on December 29. The meeting, to pay tribute to

Dr. Peterson for his years of service, was sponsored by the Cokato Association and was attended by numerous residents of the city and surrounding area. Dr. Peterson, who is seventy-eight years of age, is a graduate of the University of Minnesota Medical School.

* * *

Principal speaker at a meeting of the Minnesota Society for the Prevention of Blindness and Conservation of Vision, held in Mankato on December 14, was **Dr. Frank E. Burch** of Saint Paul.

* * *

At a meeting in the **Mayo Clinic,** Rochester, on December 7, members of the Association of Fellows elected Dr. Robert W. Jampolis, president, Dr. Donald K. Buffmire, vice president, and Dr. Walter S. Phares, secretary.

* * *

Dr. Burton Grimes, superintendent of the St. Peter State Hospital, was the main speaker at a meeting of the Nicollet Parent-Teachers Association in Nicollet on December 14. Dr. Grimes discussed aspects of mental health.

* * *

It was announced on December 30 that **Dr. W. E. Macklin** of Mankato had accepted the position of radiologist at the Rice Hospital.

Dr. Macklin practiced medicine at Litchfield from 1931 to 1943, when he joined the Navy and served in the radiology department at the National Naval Medical Center in Bethesda, Maryland, for two and one-half years. Following his release to inactive duty, he took postgraduate work in his specialty at the University of Minnesota. For the past three years he has been radiologist at the Mankato Clinic.

* * *

Dr. Francis J. Braceland and **Dr. Donald W. Hastings** were appointed early in December to serve as consultants to the division of public institutions in the development of Minnesota's mental health program. Dr. Braceland is head of the psychiatric section of the Mayo Clinic, and Dr. Hastings is professor of psychiatry and neurology at the University of Minnesota.

* * *

"Cancer and What You Can Do About It" was the title of a talk presented by **Dr. O. G. McDonald,** Duluth, at a joint meeting of the Duluth Veterans of Foreign Wars auxiliaries' cancer workers on December 7.

* * *

Announcement of the election of four new trustees of the **Minnesota Medical Foundation** was made on December 13. Elected for four-year terms were Dr. Karl W. Anderson, Minneapolis, clinical associate professor of medicine at the University of Minnesota; Dr. E. T. Bell, Minneapolis, professor emeritus of pathology at the University, and Dr. Vernon Smith, Saint Paul. Elected for one year to fill an unexpired term was Dr. George N. Aagaard, director of postgraduate medical education and associate professor of medicine at the University.

* * *

According to plans announced during the middle of January, the newly constructed **Pine River Clinic** was expected to be open by the end of the month. The one-story modern-design building will house the offices of Dr. C. M. Zeigler and Dr. A. T. Rozycki of Pine River.

* * *

On December 16, **Dr. Alfred M. Ridgway** of Annandale was honored at a surprise gathering by the Annandale Odd Fellow and Rebekkah lodges. After tribute had been paid to him in several talks, Dr. Ridgway was presented with a special emblem of the order. He has been a member of the Annandale Odd Fellow lodge for fifty-seven years.

* * *

Dr. George Janda, who was associated with the Medico-Dental Clinic in Bertha during the past year, left on January 1 to begin a four-year period of postgraduate training in obstetrics and gynecology at the University of Minnesota Hospitals.

* * *

Dr. George W. Drexler of Blue Earth has been appointed president of the Faribault County Heart Association for 1950.

* * *

Members of the **Warren hospital and clinic** staff were entertained at a dinner in Hotel Warren on December 20. Hosts and hostesses for the evening were Dr. and Mrs. C. H. Holmstrom, Dr. and Mrs. A. B. Nietfeld, and Dr. and Mrs. E. E. Pumala, of Warren. Included in the program for the evening were messages of appreciation from each of the physicians.

* * *

Dr. Albert M. Snell, a member of the Mayo Clinic staff since 1924, has resigned his position as head of a section in medicine and has moved to Palo Alto, California, to enter private practice and to become associated with the Palo Alto Clinic.

A graduate of the University of Minnesota Medical School, Dr. Snell practiced at the Mankato Clinic from 1920 until he joined the Mayo Clinic in 1924. During World War II, Dr. Snell served in the Navy from 1941 to 1943, much of the time on a hospital ship in the Pacific area. He then returned to Rochester for six months, after which he served as chief of the medical service at the Naval hospital in Oakland, California. He was finally separated from active duty in 1946.

* * *

It was announced on December 22 that **Dr. Keith D. Larson** of Minneapolis had moved to Howard Lake and planned to open offices for the practice of medicine shortly after January 1. He had made arrangements to purchase the office building, equipment, residence and land of the late Dr. Leonard Harriman of Howard Lake.

Dr. R. J. Wilkowske of Owatonna has been named chairman of the 1950 Heart Campaign for Steele County.

* * *

At a meeting of the northern St. Louis County Public Health Activities Committee in Virginia on December 10, **Dr. Mario Fischer,** Duluth, acting county health officer, discussed a reorganization plan for the city council health unit.

* * *

After practicing at Lake Benton for the past three and one-half years, **Dr. Albert M. Limburg** has moved his offices to Wilmont to conduct his practice there.

* * *

Dr. Albert E. Krieser, Mankato, will head the state's new tuberculosis control program, it was announced by Carl J. Jackson, state director of public institutions, on December 21. Dr. Krieser, who served in the Army for five years in World War II, has been associated with the state sanatorium at Ah-Gwah-Ching and has been tuberculosis consultant at the St. Peter State Hospital. His headquarters in his new position will be at Anoka State Hospital, where a new tuberculosis unit is being set up.

* * *

"The Recent Trend of Psychiatry" was the title of a talk given by **Dr. A. H. Langhoff** of Mankato at a meeting of the Mankato Registered Nurses Club on December 12.

* * *

Dr. Henry Goss of Glencoe was the principal speaker at a meeting of hospital, public health and other registered nurses in Glencoe on December 9. Dr. Goss spoke on "Care of the Mother and Newborn Infant."

* * *

Four Mayo Clinic fellows received awards for superior quality graduate theses at the annual staff meeting on December 21. The four who received the awards were Dr. B. E. Taylor, Dr. A. B. Taylor, Dr. W. B. Martin and Dr. D. S. Childs.

* * *

The Willmar State Hospital acquired a new staff physician during December when **Dr. Robert B. May** arrived in the city to begin his duties at the hospital. Dr. May is the former superintendent of the Eastern Shore State Hospital, Cambridge, Maryland.

* * *

Dr. Elmer J. Martinson, son of Dr. Carl J. Martinson of Wayzata, has opened offices for the practice of surgery in the Martinson Clinic Building. A graduate of the College of Medical Evangelists, Los Angeles, Dr. Martinson interned at Minneapolis General Hospital, then served in the Army for several years. Following this he completed a fellowship in surgery at the University of Minnesota. He has been a resident surgeon at Minneapolis General, Minneapolis Veterans and Fargo Veterans Hospitals.

HOSPITAL NEWS

Following are the results of various hospital staff elections recently held in Minnesota.

Immanuel Hospital, Mankato.—Dr. G. E. Penn, president; Dr. R. G. Hassett, vice president; Dr. O. H. Jones, secretary. All were re-elected to office. Named to the executive committee were Dr. P. G. Hoeper, Dr. H. J. Nilson and Dr. F. W. Franchere.

Asbury Hospital, Minneapolis.—Dr. Alfred N. Bessesen, president; Dr. H. A. Alexander, vice president; Dr. Richard S. Rogers, secretary-treasurer. Dr. Stanley R. Maxeiner was elected to the medical advisory board to serve with Dr. Ann W. Arnold, Dr. Roscoe C. Webb, and Dr. Charles H. McKenzie.

St. Joseph Hospital, Mankato.—Dr. J. A. Butzer, president; Dr. O. H. Jones, vice president; Dr. A. A. Schmitz, secretary-treasurer. Reappointed to the executive board were Dr. M. I. Howard, Dr. A. E. Sohmer and Dr. J. A. Butzer.

Abbott Hospital, Minneapolis.—Dr. Orwood J. Campbell, president; Dr. John Haugen, vice president; Dr. Walter Hoffman, secretary.

Miller Hospital, Duluth.—Dr. M. G. Fredericks, chief of staff; Dr. Earl Barrett, vice chief of staff; Dr. Henry Jeronimus, secretary-treasurer. Named to the executive committee were Dr. Karl Johnson, Dr. Kenneth Teich and Dr. Mario Fischer (ex-officio member).

St. Cloud Hospital, St. Cloud.—Dr. N. F. Musachio, chief of staff.

St. Gabriel's Hospital, Little Falls.—Dr. E. J. Simons, president; Dr. D. E. Johnson, vice president; Dr. R. J. Stein, secretary. Named to the executive committee were Dr. J. T. Laughlin, Dr. G. M. A. Fortier and Dr. E. G. Knight.

Swedish Hospital, Minneapolis.—Dr. J. S. Milton, president; Dr. Harold T. Gustason, vice president, and Dr. Stanley Lundblad, secretary-treasurer.

Eitel Hospital, Minneapolis.—Dr. James A. Blake, chief of staff; Dr. Alton C. Olson, assistant chief of staff; Dr. Melvin B. Sinykin, secretary. All were re-elected to office.

* * *

Four new medical staff members of **Fairview Hospital,** Minneapolis, were named by the board of directors at a meeting on December 20. They are Dr. Loren J. Larson, Dr. Albert J. Schroeder, Dr. Harold S. Ulvestad and Dr. Harold G. Worman.

* * *

The Ramsey County Welfare Board voted on December 13 to retain the services of seven teaching medical men at **Ancker Hospital**, Saint Paul, but it postponed decision on where to get money to pay them. In the past the men were financed by the University of Minnesota. However, the University had announced that it was withdrawing its support beginning July 1 because of new arrangements with Minneapolis Veterans Hospital. Since eliminating the services of the men would greatly curtail the activities of Ancker as a teaching hospital, the board decided it would have to find $10,050 to finance the men for the last half of the year.

The Birches Sanitarium, Inc.
2391 Woodland Avenue
Duluth 3, Minnesota

A hospital for the care and treatment of Nervous and Mental disorders. Quiet, cheerful environment. Specially trained personnel. Recreational and occupational therapy.

Psychiatrists in Charge
L. R. Gowan, M.D. L. E. Schneider, M.D.

REST HOSPITAL
2527 Second Avenue South, Minneapolis

A quiet, ethical hospital with therapeutic facilities for the diagnosis and treatment of nervous and mental disorders. Invites co-operation of all reputable physicians. Electroencephalography available.

PSYCHIATRISTS IN CHARGE
Dr. Hewitt B. Hannah
Dr. Andrew J. Leemhuis.

BLUE CROSS-BLUE SHIELD NEWS

January 10, 1950

TO: Participating Doctors of Minnesota Medical Service Inc.

My dear Doctor:

Apparently there has been some dissatisfaction and misunderstanding on the part of some doctors regarding certain features of Blue Shield and Blue Cross. So, it occurred to me that a few words of explanation should prove of benefit to both the doctors and the organizations.

In principle, insurance serves as a protection from a major loss. Only rarely does it fully reimburse the insured for the total loss. This feature is almost universally seen in automobile insurance in which the insured is reimbursed for the balance of $25 or $50. In other words, were it not for this principle, that is reimbursement of part but not all of the cost or loss, insurance would be an investment rather than a safeguard against extensive loss.

Yet, it is this feature of medical care insurance that is causing the misunderstanding in the minds of many physicians. General practitioners complain that medical insurance does not cover office and house calls; various specialists are unhappy because their full fees for each service are not covered; and both family doctors and specialists are dissatisfied that all diagnostic services, such as x-rays especially, are not covered in the policies.

It is the full coverage features among other things which have cost the British and European health insurance programs so excessively. It is the full coverage feature of Compulsory Health Insurance in this country that will either bankrupt the government or lead to some form of collectivism. In other words, full coverage medical and hospital care is only possible at exorbitant cost to its underwriters.

In the present instance, x-ray fees and services are causing difficulty. In a recent analysis of Blue Shield contracts, Minnesota's was found more liberal in x-ray services. Beyond this, administrative personnel and the Boards of Directors are liberal in consideration of x-ray services whenever liberality is possible. Despite these facts, diagnostic x-ray services and hospitalization of patients solely for the purpose of having x-ray services paid for by either Blue Shield or Blue Cross are working hardships upon the organizations.

Unless it is possible to reduce costs of diagnostic x-ray services or hospitalization solely for x-ray services, the end-point could be either insolvency or raising the premiums. Blue Shield has paid over a million dollars for medical care and Blue Cross over eight million dollars for hospital care during the past year. From the contract holder's viewpoint much money has been saved him. From the doctor's and hospital's viewpoint it is reasonable to assume that more bills have been paid than would have been paid were the patients not insured under either or both Blue Cross and Blue Shield. Add to this the fact that these organizations provide a program by which the American people can preserve for themselves free choice of physician and the other

RELIABILITY!

For years we have maintained the highest standards of quality, expert workmanship and exacting conformity to professional specifications . . . a service appreciated by physicians and their patients.

principles of American medicine which have given them the lowest death rate and the highest level of health of any comparable population in the world.

So, it seems not without reason to plead co-operation in minimizing x-ray fees for diagnosis and especially hospitalization merely to cover diagnostic x-ray services. Such co-operation would be a distinct contribution to the continued success of both Blue Shield and Blue Cross, as well as a thorn in the flesh of those advocating compulsory sickness insurance.

Yours very truly,
Edwin J. Simons, M.D.
Chairman, Medical Advisory Committee
Minnesota Medical Service, Inc.

Tuberculosis is not a simple health problem like the removal of tonsils or the repair of a broken leg. It is a complex, long-time ailment almost always resulting in a special way of living. Tuberculosis involves many things besides hospital, medical, and nursing care. It has many requirements on the social welfare side and these needs are often of long duration. The tuberculosis problem is one of prehospital and posthospital care with all that they mean. Moreover, it is a problem of the care of the patient's family as well as of the patient.—Ruth Taylor, *Nat. Tuberc. A. Bull.*, October, 1949.

TREATMENT OF DEAFNESS WITH HISTAMINE

(Continued from Page 159)

provement in hearing. The result showed eight patients improved, five not benefited and three slightly improved. Further study in the use of histamine in the treatment of nerve deafness seems warranted. Careful selection of cases is important since it is very easy to arbitrarily give all deaf patients the same treatment in a too zealous attempt to achieve results beyond the realm of this medication.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

CLINICAL CASE-TAKING; GUIDES FOR THE STUDY OF PATIENTS; HISTORY-TAKING AND PHYSICAL EXAMINATION OR SEMIOLOGY OF DISEASES IN THE VARIOUS SYSTEMS. By George R. Herrmann, M.D., Ph.D., Professor of Medicine, University of Texas. 4th edition. 240 pages. St. Louis: The C. V. Mosby Company, 1949. Price $3.50.

This manual is intended primarily for instruction and uidance of clinical clerks in the author's hospital, but xcept for a few specific items of local application could vell be used anywhere. The first section presents the mportance of history taking. There is much emphasis n establishment of proper rapport with the patient and an attempt is made to assist the student in this direction. nstructions for history taking and physical examination re very complete, covering first the general medical roblem and then devoting chapters to various special roblems. The appendix lists symptoms by regions with ossible causative conditions.

The book may have little appeal for physicians in ractice; however, for one willing to spend the time, it erves as an excellent check on the adequacy of his xaminations.

David M. Craig, M.D.

HUMAN BIOCHEMISTRY. By Israel S. Kleiner, Ph.D., Professor of Biochemistry and Director of the Department of Physiology and Biochemistry, New York Medical College, Flower and Fifth Avenue Hospitals; Formerly Associate, The Rockefeller Institute for Medical Research, New York. 2d edition. 649 pages. Illus. St. Louis: The C. V. Mosby Company, 1948. Price $7.00.

This book is a gratifyingly successful attempt to correlate biochemistry with clinical medicine. As a textbook he material is well presented, is illustrated with wellhosen, appropriate and instructive graphs and pictures. The author has drawn from many sources for his maerial and has supplemented his remarks with a valuable ibliography. Besides a reference for general review of he changing concept of biochemistry, the practitioner vill find particular value in the last chapters which deal vith the effect of various drugs on the body and recent linical applications of chemistry to medicine.

sunshine *q.s.*

Vitamin D supplementation for infants and growing children is sound prophylactic practice at all times.

But in wintertime especially, when shortened days, clouded skies, heavy clothing, and lengthened indoor hours combine to deprive the growing body of sunshine's benefits, specific antirachitic measures are of special importance.

For more than 15 years, physicians have depended on Mead's Oleum Percomorphum to provide year-round protection against rickets —as well as the host of additional symptoms attributed to fat-soluble vitamin deficiencies in children and adults alike.

Mead's Oleum Percomorphum With Other Fish Liver Oils and Viosterol is a standardized source of vitamins A and D in high potency which permits small dosage—liquid or capsule. Council-Accepted, it is advertised to the medical profession *only*.

SPECIFY

OLEUM PERCOMORPHUM

LIQUID—60,000 units of vitamin A and 8,500 units of vitamin D per gram, dropper bottles of 10 cc. and 50 cc.

CAPSULES—5,000 units of vitamin A and 700 units of vitamin D per capsule, bottles of 50 and 250.

The cost of medication, of course, is but one item in the total cost of lness, the greatest expense stemming from the length of incapacitation nd consequent loss of working time. One distinct advantage of HLOROMYCETIN therapy is its fundamental economy—quick clinical esponse, reduced morbidity, shortened convalescence and earlier return of the patient to his job.

Particularly dramatic results are now obtained in a disease such s typhoid fever, where the illness formerly ran its course for several eeks because of lack of specific therapy. Lengthy hospitalization, special nursing care, the supportive measures during this prolonged period -all have contributed to increased costs. However, CHLOROMYCETIN hanges this: the duration of illness is greatly reduced, defervescence ccurring within 2 to 3 days after treatment is begun. With control of ne infection, general improvement is manifest and recovery is rapid.

The high degree of efficacy of CHLOROMYCETIN has also been demnstrated in a number of other diseases previously unresponsive or oorly responsive to treatment, such as acute undulant fever, urinary act infection, bacillary and atypical pneumonia, typhus fever, Rocky ountain spotted fever, scrub typhus, and granuloma inguinale.

PD CO.

The Balance Sheet

We are all striving mightily to set aside some portion of our income in reserve. This is not an easy task in this day of heavy taxation. Yet these reserves are important; to be used for contingencies that we cannot predict today. It's silly to be forced to stand idly aside and watch those reserves being dissipated through protracted periods of disability when you could have prevented it by the purchase of an outstanding Disability Policy.

It's only logic that indicates that your best plan of income protection is through the plan available to you through your Association.

Tomorrow may be too late—ACT NOW.

Aureomycin is now rapidly becoming recognized as a drug of choice in the treatment of mixed bacterial genitourinary infections, particularly those in which *Escherichia coli* and *Aerobacter aerogenes* play a part. Intractability of a genitourinary infection is an especial indication for aureomycin.

Aureomycin has also been found highly effective for the control of the following infections: African tick-bite fever, acute amebiasis, bacterial and virus-like infections of the eye, bacteroides septicemia, boutonneuse fever, acute brucellosis, Gram-positive infections (including those caused by streptococci, staphylococci, and pneumococci), Gram-negative infections (including those caused by the *coli-aerogenes* group), granuloma inguinale, *H. influenzae* infections, lymphogranuloma venereum, peritonitis, primary atypical pneumonia, psittacosis (parrot fever), Q fever, rickettsialpox, Rocky Mountain spotted fever, subacute bacterial endocarditis resistant to penicillin, tularemia and typhus.

. . . . YES! *Keleket's* new

Give you COMPLETE

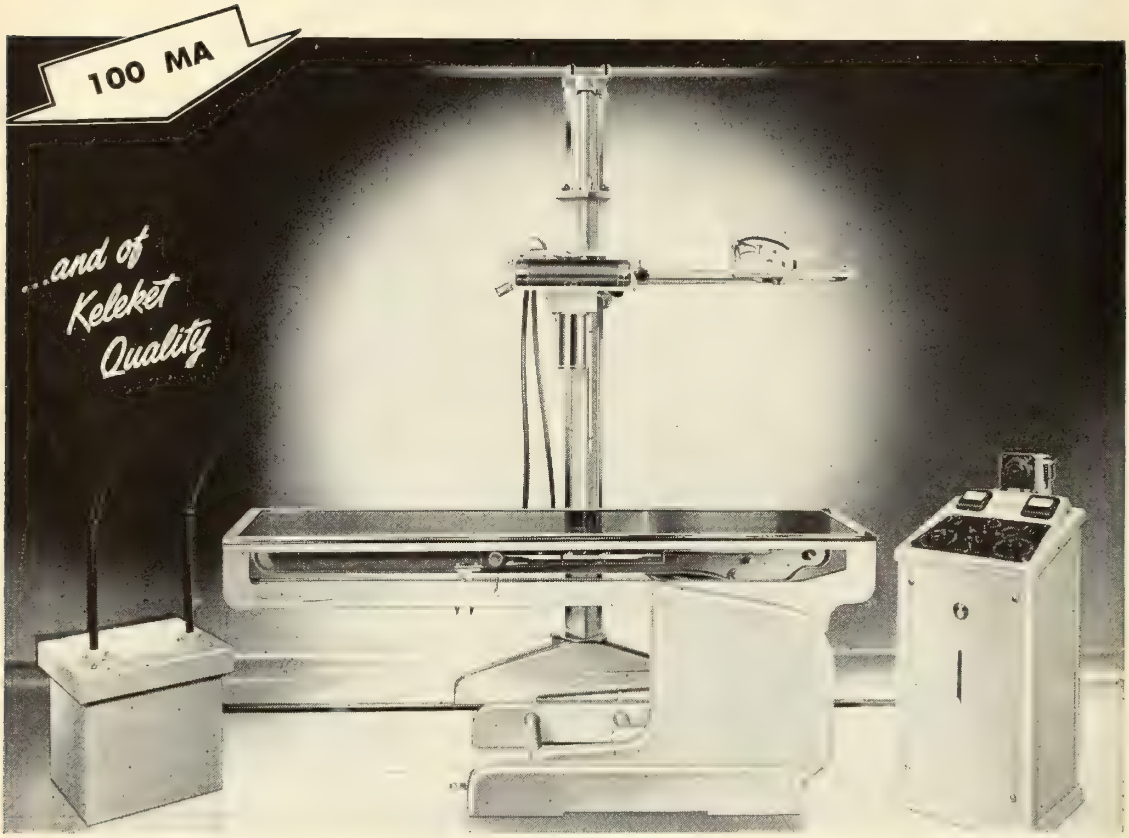

Illustration above shows 100 MA Combination with the basic table and Floor-To-Ceiling tubestand. This combination includes the famous Keleket Multicron Generator.

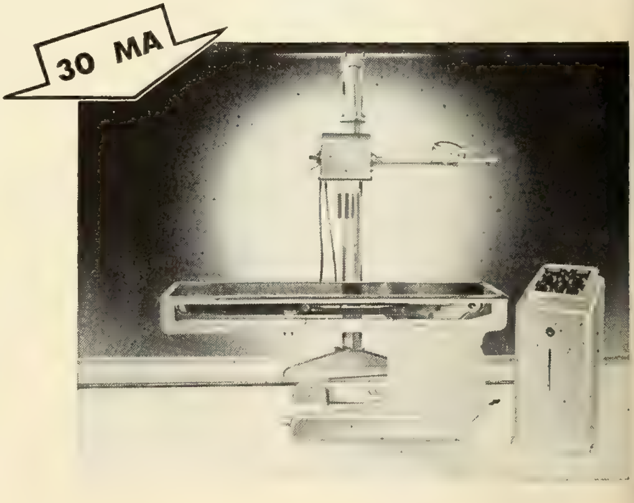
Here is how the Keleket Add-A-Unit Combinations Work

Choose the combination to suit your practice!

You purchase the new standard (not a reduced) size Keleket Tilt Table and Tubestand. Then add either 15, 30 or 100 MA tube and generating equipment. You can advance from 15 to 30 and to 100 MA but still retain the original table and tubestand. As a result, this investment is never lost when you step up to higher power tubes and generating equipment.

Illustration below shows 30 MA combination with the same basic table and Floor-To-Ceiling tubestand. This combination includes the 30 MA self-contained tubehead and precision control.



Add-a-Unit Combinations X-RAY EQUIPMENT

. . . for FULL RANGE Fluoroscopy and Radiography

Keleket scores again, with a new approach to the use and purchase of X-ray equipment. Keleket has developed a FULL SIZE Standard Tilting Table with a completely new, highly flexible floor to ceiling tubestand. This basic X-ray equipment is equally adaptable for either 15, 30 or 100 MA tube and generating units.

GROWS WITH YOUR REQUIREMENTS

Start out with the simplest 15 MA tubehead; then at a future date change to a 30 MA tubehead, if you desire. Whenever you're ready, step up to a 100 MA generating unit. As a result, your Keleket equipment grows with your requirements.

THROUGHOUT ALL INTERCHANGES YOU RETAIN THE SAME KELEKET "ADAP"-TABLE AND TUBESTAND.

FUTURE COSTS SAVED

This means you eliminate one of the biggest cost factors in equipment—new table and tubestand costs as you step up your tube capacity and power.

In addition, your original investment is never lost—Keleket offers you generous allowance values on the equipment you interchange.

FULL RADIOGRAPHIC-FLUOROSCOPIC FACILITIES

Any of these combinations will fully meet your current needs for full range radiography and fluoroscopy. Perform radiography in horizontal and trendelenburg positions, vertical and horizontal fluoroscopy. The tubestand, for example, is so flexible that you can swing the tubehead away from the table and radiograph stretcher cases on the opposite side.

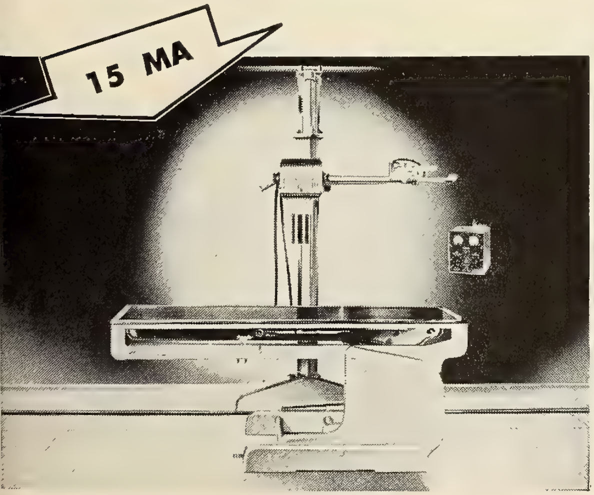
And if you want a bucky diaphragm, even the lowest cost unit is equipped to accommodate one.

Write of phone us for more information

Keleket X-Ray Sales Corporation of Minnesota

1111 Nicollet Avenue Minneapolis 3, Minnesota

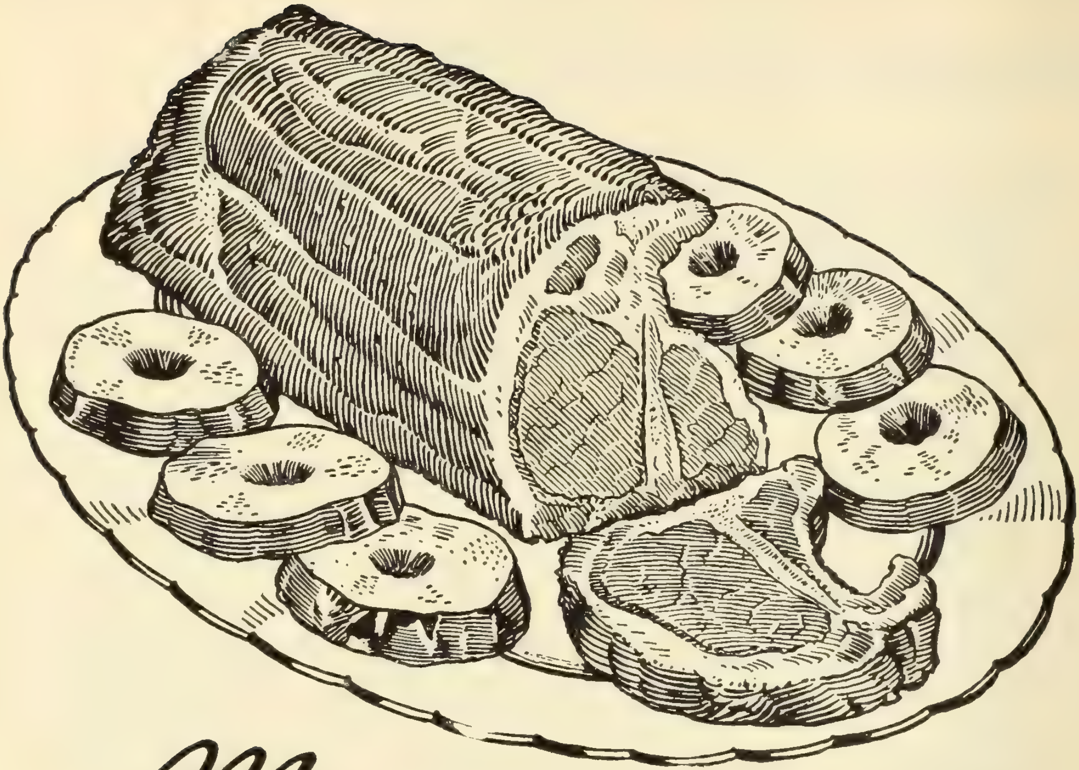
Illustration below shows same basic table and tubestand with a new self-contained 15 MA tubehead and control.



A new approach to use and purchase of X-Ray equipment.

GENEROUS ALLOWANCE VALUES . . . YOUR ORIGINAL INVESTMENT NEVER LOST.

Yes, with minimum cost you can obtain full radiographic-fluoroscopic facilities with Keleket Add-A-Unit Combinations—made possible for the first time with the new Keleket Flexible Floor-To-Ceiling Tubestand and Basic Tilt Table. Write for complete information.



Meat...

Outstanding Value...

Outstanding Nutritional Benefits

Whether the pocketbook calls for economy or permits satisfaction of that urge for the fanciest cuts, meat gives your patients full value for their money. Every cut and kind of meat supplies, *in abundance*, these essential nutrients:

1. Biologically complete protein . . . the kind which satisfies the requirements for growth and which is needed daily for tissue maintenance, antibody formation, hemoglobin synthesis, and good physical condition.
2. The essential B complex vitamins, thiamine, riboflavin, and niacin.
3. Essential minerals, including iron in particular.

In addition to these tangible values, meat ranks exceptionally high not only in taste and palate appeal, but also in satiety value.

The instinctive choice of meat as man's favorite protein food has behind it sound nutritional justification.*

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association.

"PREMARIN"®

Estrogenic Substances (water-soluble) also known as Conjugated Estrogens (equine).

"Premarin"—a naturally conjugated estrogen—long a choice of physicians treating the climacteric—has been earning further clinical acclaim as replacement therapy in hypogenitalism.

In the treatment of hypogenitalism, "Premarin" supplies the estrogenic factors that are missing, and thus tends to eliminate the manifestation of the hypo-ovarian state. The aim of therapy is to develop the reproductive and accessory sex organs to a state compatible with normal function.

Four potencies of "Premarin" permit flexibility of dosages: 2.5 mg., 1.25 mg., 0.625 mg., and 0.3 mg. tablets; also in liquid form, 0.625 mg. in each 4 cc. (1 teaspoonful).

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens... estradiol, equilin, equilenin, hippulin... are probably also present in varying amounts as water-soluble conjugates.

ULMER PHARMACAL COMPANY

A Representative Group of Ulmer Pharmacal Specialties

In our modern, completely-equipped laboratory, highly skilled graduate pharmacists and chemists are engaged in refining and developing Ulmer Pharmaceuticals. The items offered under the Ulmer label represent ethical development of the ideas of medical men and are produced in cooperation with physicians, clinics, and hospitals, to meet the exacting needs of the medical profession. Precise control and analytical laboratory tests guarantee the uniformity and purity of all Ulmer Pharmaceuticals. The scientific activities of our research staff assure continual development and refinement of new ideas as the need develops. Full information on the Ulmer Line appears in our medical catalog. Refer to it and be sure to include the name ULMER in your next drug order.

The area surveyed in the Fifth Edition of "Biliary Tract Disturbances," now available, is the entire, ramified biliary tree—its anatomic and physiologic background and the diagnosis and therapy of its disorders.

Physicians and surgeons acquainted with previous editions of this monograph will find the newly revised, enlarged and illustrated edition even more practical. The brochure concisely presents basic concepts of biliary tract disease, and reviews recent progress in the management of biliary disorders with hydrocholeretics and other measures. You may receive your copy on request from the Medical Department, Ames Company, Inc., Elkhart, Indiana.

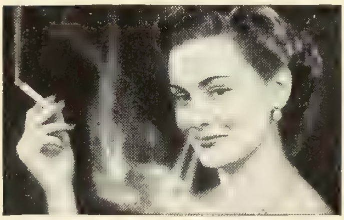
DOCTOR,
WILL YOU MAKE
THIS NOSE TEST?

SEE AT ONCE PHILIP MORRIS ARE LESS IRRITATING

It is one thing to read published studies.* Quite another to have your own personal experience provide the proof! The PHILIP MORRIS nose test takes but a moment. Won't you try it?

HERE IS ALL YOU DO:



1 . . . light up a PHILIP MORRIS

Take a puff—DON'T INHALE. Just s-l-o-w-l-y let the smoke come through your nose. AND NOW . . .

2 . . . light up your present brand

Do exactly the same thing—DON'T INHALE. Notice that bite, that sting? Quite a difference from PHILIP MORRIS!

With proof so conclusive, would it not be good practice to suggest PHILIP MORRIS to your patients who smoke?

NEUROPSYCHIATRIC AND LABORATORY OBSERVATIONS IN 147 PATIENTS FOLLOWING CRANIO-CEREBRAL INJURIES

AXEL OLSEN, M.D., and RALPH ROSSEN, M.D.
Minneapolis, Minnesota

DESPITE the excellent clinical and fundamental observations of various workers in the field of cerebral concussion and post-traumatic cerebral states it is still difficult to evaluate and prognosticate the outcome of head injuries in the human. The literature discloses that there is still a wide gap in the observations pertaining to experimental cerebral concussion in animals and the clinical impressions gained from the study of humans, especially in the psychological sphere.[1,4,8,9]

Electroencephalography appears to come the closest to narrowing this gap, especially in the study of post-traumatic seizures.[5] Recent investigations on the physiological basis of concussion[1,9] and the clinical effects of trauma to the head[3] and studies of the electrical activity of the cortex in recent and late head injury[4,5,8] have contributed much to the knowledge of this field. However, does severe trauma to the head, whether the ensuing pathologic process be chemical, electrical or psychological, change an individual's total personality permanently, or can he revert to what he was before his head injury? It is easy to comprehend the detrimental effects psychologically in an individual who develops overt post-traumatic neurological manifestations such as epilepsy or a paralysis or a paresis of one or more extremities. It is often much more difficult to evaluate the detriment to the personality in the individual who complains of headache, dizziness, instability, irritability, emotional instability or fatigueability long after the event of his head trauma. How many of these symptoms are superimposed psychological factors and how many are actually due to the head injury present almost insurmountable difficulties to the attending physician.

Do "blackouts" and vertiginous attacks[2] precede the first post-traumatic seizure and what part can electroencephalography play in early diagnosis? Can a pathologic condition in the region of the inferior surface of the orbital lobe (area 13) account for some of the symptoms of the so-called post-concussion syndrome?[9]

The foregoing problems led to the present study of 147 patients, many of whom had sustained relatively severe cranio-cerebral injuries, to determine, if possible, the relationship of the trauma to the persisting neurological, psychiatric, electroencephalographic and roentgenological abnormalities.

Method

An attempt was made to correlate the electroencephalographic findings with:

1. Time in months between head injury and E. E. G. examination.
2. The number of patients with residual symptoms of:
    (a) post-traumatic seizures
    (b) headache

We wish to take this opportunity to express our thanks to Captain George Raines (MC) U.S.N., Captain S. M. Smith (MC) U.S.N.R., and other members of the neuro-psychiatric staff who were at the U. S. Naval Hospital, Portsmouth, Va., during the period from January, 1944, to January, 1946, for their splendid co-operation in making this work possible.

The opinions or assertions contained herein are the private ones of the writers and are not to be construed as official or reflecting the views of the Navy Department or the naval service at large.

  - (c) "blackouts"
  - (d) dizzy spells
  - (e) various other neuropsychiatric complaints.

3. The number with residual defects in the skull as shown by x-ray examination.
4. Those patients with objective neurological findings.
5. The period of unconsciousness.

No follow-up was obtained on any of these patients after they left the hospital. The objective neurological signs were not included when they were transient or equivocal.

Material.—Over a period of two years (1944 and 1945) material was collected from patients with head injuries who were on the neurosurgical service at the U. S. Naval Hospital, Portsmouth, Va., or from patients referred to the same activity from surrounding naval, coast guard and army hospitals for electroencephalogram (E. E. G.) studies. One hundred forty-seven patients with an age variation from nineteen to thirty-eight years were studied. The series was divided into two groups: Seventy-three patients who did not have E. E. G. studies and seventy-four who did have E. E. G. studies. Either because the patients were studied and disposed of before there was an E. E. G. apparatus available or because this type of consultation was not requested, E. E. G. examinations were not performed on the first group (seventy-three). Each case history was analyzed in regard to age, date of injury, type of injury, duration of unconsciousness (where this could be obtained), residual objective neurological findings and residual subjective neuropsychiatric symptoms. The date and lapse of time between injury and first convulsive seizure and diagnosis were correlated. Analysis was made of those patients with a retained foreign body in the cranium or with skull defects as a result of the injury. In the group which had E. E. G. examinations attention was also given to the time interval between head injury, onset of first seizure and the E. E. G. examination.

All patients received careful neuropsychiatric examinations, indicated laboratory tests and indicated consultations from various other departments. The subjective complaints and objective neurological findings considered were those that were present at or about the time of the E. E. G. examination and consisted of headaches, dizzy spells, nervousness, anxiety and easy fatigueability. In the group evaluated which did not have E. E. G. examinations, the clinical findings evaluated were those present during the patient's period of hospitalization.

Of the 147 patients studied, 100 were discharged from the U. S. Naval Hospital, Portsmouth, Va. These patients were observed over a period varying from one to six months, depending upon the severity of their residual symptoms. Of this group forty-one were discharged with the diagnosis of intracranial injury, twenty-four with the diagnosis of blast concussion, ten with the diagnosis of fractured skull, seventeen with the diagnosis of gunshot wound (head or shrapnel wound), three with the diagnosis of headache and five with miscellaneous diagnoses including psychoneurosis. The remaining forty-seven patients were from other military activities and their discharge diagnoses were not known. The majority of these individuals had sustained their head injuries in line of duty; many of them were injured in front-line combat, and it was, therefore, difficult in some of them to determine the exact duration of unconsciousness. Every attempt was made to obtain all pertinent data, but it was felt that it was best to consider time periods of unconsciousness unknown unless they were relatively exact.

All of the patients were conscious at the time of their E. E. G. examinations, and except for four of them, all had suffered their head injuries at least three months previous to their E. E. G. examinations. Thus, no studies on very recent severe or mild head injuries were obtained. Almost all of the patients had neuropsychiatric complaints at the time of their E. E. G. examinations or at the time of their admission to the hospital.

Electroencephalographic Technique and Method of Interpretation.—The electrical activity of the right and left frontal, parietal and occipital cortex was recorded with a Grass 6-channel electroencephalograph. All records were made with scalp to ear leads. The indifferent electrode was formed by interconnecting the two ear leads. Electrodes were applied to the scalp, using the method described by Gibbs.[6] Records were taken with the patient lying on a table in a shielded cage. Cortical activity was recorded for at least ten minutes on each subject. Two minutes were allowed for hyperventilation and two to three minutes were allowed for recovery. Gibbs' classification of E. E. G. records[7] was used throughout, with the following modifications: all paroxysmal tracings (petit mal, psychomotor, grand mal, spikes and S.2 and F.2 tracings) were classified as abnormal. The F.1 and S.1 tracings were classified as having slight abnormalities. All activity in the range of 8 to 13.5 per second was classified as normal. In records of all tracings mention was made as to whether the abnormalities were focal or non-focal in type. The whole record was carefully reviewed and random wave counts were made on at least 40 seconds of record before and after hyperventilation.

TABLE I. CORRELATION OF E. E. G. FINDINGS AND TIME IN MONTHS BETWEEN DATE OF HEAD INJURY AND ELECTROENCEPHALOGRAPHIC EXAMINATION

Time in Months Between Date of Head Injury and Electroencephalogram	Number of Cases	Electroencephalographic Findings		
		Normal	Slightly Abnormal	Greatly Abnormal
3 to 6*	29	15	7	7
6 to 12	18	7	7	4
12 to 24	9	5	2	2
24 to 36	4	3	1	0
36 to 48	3	2	1	0
48 to 60	0	0	0	0
60 to 72	0	0	0	0
Over 72	6	4	0	2
History of head injury, time unknown	5	3	2	0
Total Number of Cases	74	39 (52.7%)	20 (27%)	15 (20.3%)

*The true element in 4 of these 29 cases was just under 3 months.

TABLE II. CORRELATION OF E. E. G. FINDINGS WITH PRESENTING SYMPTOMS

Presenting Symptom	Number of Cases	Normal		Slightly Abnormal		Greatly Abnormal		Focal or Non-Focal E. E. G. Abnormality	
		No.	Pct.	No.	Pct.	No.	Pct.	Slightly Abnormal	Greatly Abnormal
"Blackout"	7	5	72%	1	14%	1	14%		
Dizzy spells	15	12	80%	2	13%	1	7%		
Headache	40								
(a) headache alone	14	8	57.14%	3	21.43%	3	21.43%		
(b) headache and other symptoms	26	21	81%	3	11%	2	8%		
One or more objective neurological signs other than convulsive seizure	17	5	29.4%	5	29.4%	7	41.2%		
Nervousness, anxiety, attacks of confusion, memory lapses, easy fatigability	15	10	67%	3	20%	2	13%		
Post-traumatic seizures (observed)	9	1	11%	3	33%	5	56%	1 in the right parietal lead	2 in the right and left frontal areas

Results

Analysis of Total Number of Cases.—Analysis was made of 147 cases of cranio-cerebral war injuries, one hundred of these with the closed type (including lacerated scalp without skull fracture), the remaining forty-seven having sustained compound wounds of the skull with brain injury. Of this total group, by far the most frequent subjective complaint was headache which occurred in 112 patients. Of these 112, seventy-three complained of headache alone while thirty-nine had in addition to their headache one or more other subjective symptoms. Nine per cent developed post-traumatic epilepsy, 33 per cent had residual neurological findings of various types, 67 per cent complained of headache, 26 per cent complained of "blackout" or "dizzy spells" and 19 per cent complained of nervousness, anxiety, memory lapses and easy fatigueability.

Analysis of 74 Cases with E. E. G. Studies.—Forty-eight of these had closed head injuries (including lacerated scalp without skull fracture); the remaining twenty-six cases had compound skull and brain wounds.

Table I shows the correlation between date of head injury and the result of the E. E. G. examination. Of this group, forty gave a history of headache plus some other symptoms, fourteen gave a history of headache alone, seven gave a history of "blackout,"[2] fifteen stated that they suffered from dizzy spells, fifteen voiced various psychiatric complaints such as nervousness, anxiety, attacks of confusion, memory lapses and fatigue, seventeen had one or more objective neurological findings and nine had post-traumatic seizures.

Table II shows the distribution of the total group in regard to symptoms and E. E. G. type of abnormality.

TABLE III. CORRELATION OF E. E. G. FINDINGS WITH LENGTH OF UNCONSCIOUSNESS

Length of Unconsciousness	Number of Cases	Electroencephalographic Findings		
		Normal	Slightly Abnormal	Greatly Abnormal
Less than 6 hours	7	3	4	0
12 to 24 hours	2	0	1	1
24 to 48 hours	3	1	1	1
48 to 72 hours	2	1	1	0
3 to 6 days	2	1	0	1
14 days	1	0	1	0
Not unconscious*	3	1	1	1
Total	20	7	9	4

*Of these three cases:
One had skull fragments in his scalp. He had an abnormal E. E. G.
One was dazed and had a slightly abnormal E. E. G.
One had sustained a simple skull fracture and had a normal E. E. G.

TABLE IV. CORRELATION OF E. E. G. FINDINGS WITH TYPE OF HEAD INJURY

Type of Head Injury	Number of Cases	Electroencephalographic Findings			E. E. G. Findings, Focal	
		Normal	Slightly Abnormal	Greatly Abnormal	Slightly Abnormal	Greatly Abnormal
Compound skull and brain injury	26	12 (46%) One of these P. T. E.*	6 (23%) One of these P. T. E.	8 (31%) 4 of these P. T. E.	1 focal, right parietal	2 focal, bifrontal, one of these especially R. F.
Closed head injury without skull fracture but including laceration of the scalp	48	27 (56.25%)	14 (29.17%) Two of these P. T. E.	7 (14.58%) One of these P. T. E.		
Total	74	39 (52.7%)	20 (27%)	15 (20.3%)		

*P. T. E.: post-traumatic epilepsy

Table III shows correlation of E. E. G. findings with length of unconsciousness.

Table IV shows correlation of E. E. G. findings with the type of head injury.

1. E. E. G. Results in Patients with Objective Neurological Findings other than a Convulsive Disorder.—Of this group of seventeen patients, five had normal E. E. G. findings, seven had greatly abnormal E. E. G. findings, and five showed slightly abnormal E. E. G. findings.

Of the five patients with normal E. E. G. findings one had peripheral visual field constriction, one had a paresis of his right arm (this patient showed x-ray evidence of small left parietal defect), one had right oculo-motor paresis (this patient showed x-ray evidence of a foreign metallic body and a bony defect in the right temporal area), one had an unsteady gait, slight right deafness and horizontal nystagmus (left component), and one had right-sided nerve deafness (this patient showed x-ray evidence of a fracture through the right temporal bone).

Of the seven who had marked abnormal E. E. G. findings, one showed a horizontal nystagmus to the left, one showed right-sided mild cerebellar symptoms, one showed a left dilated pupil and could not converge his eyes, one showed right-sided homonymous heminopsia, one showed bilateral anosmia and left-sided deafness, and one showed nerve deafness of the left ear. The seventh patient showed a focal E. E. G. (left parietal region). In addition he had x-ray evidence of a foreign metallic body in the left occipital region, a positive Hoffman (right side) and right lower quadrant homonymous heminopsia.

Of the five patients who showed slightly abnormal E. E. G. findings, one had a complete left facial paralysis and total anosmia, one showed mild right-sided cerebellar signs, one showed left-sided paresis of the arm, leg and face (skull x-ray showed a bony defect in the right parietal region), one showed horizontal nystagmus to the left, and one had focal findings in the left frontal and right occipital regions (this patient had an unsteady gait and left lower facial weakness).

One patient was neurologically negative and had a normal E. E. G. but showed x-ray evidence of a foreign metallic body in the left occipital region of the skull. This man voiced subjective complaints of headache and dizzy spells.

2. E. E. G. Findings in Patients Who Presented Dizziness plus Other Subjective Complaints.—Fifteen of the seventy-four patients presented dizziness as a subjective complaint. All of these patients, in addition, voiced one or more other somatic complaints. Twelve (80 per cent) had a normal E. E. G., one (7 per cent) had a greatly abnormal E. E. G. and two (13 per cent) had a slightly abnormal E. E. G.

3. E. E. G. Findings Correlated with the Duration of Unconsciousness following Head Injury.—Of the total number of patients, seventy-four had had E. E. G. examinations. The duration of unconsciousness was not known in fifty-four. Of these fifty-four patients, thirty-one had a normal E. E. G., eleven had a greatly abnormal E. E. G., and twelve had a slightly abnormal E. E. G.

Seven patients had been unconscious for six hours or less. Of these, three had normal and four had slightly abnormal E. E. G., non-focal in type. Two patients had been unconscious for from twelve to twenty-four hours; one of these had greatly abnormal and one slightly abnormal E. E. G., non-focal in type. Three had been unconscious from twenty-four to forty-eight hours; one of these had a greatly abnormal E. E. G., one a slightly abnormal, and one had a normal E. E. G. Two had been unconscious forty-eight to seventy-two hours; one of these had a slightly abnormal E. E. G. and the other had a normal E. E. G. Two had been unconscious for six days; one of these had a greatly abnormal E. E. G., the other had a normal E. E. G. One patient had been unconscious for two weeks and had a slightly abnormal E. E. G., non-focal in type.

Three patients had not been unconscious, and of these one had a normal E. E. G., one had a greatly abnormal E. E. G. and one had a slightly abnormal E. E. G., non-focal in type. Of these three patients one had skull fragments in his scalp. He had an abnormal E. E. G. One had been dazed and had a slightly abnormal E. E. G. The third had sustained a simple skull fracture and had a normal E. E. G.

4. E. E. G. Findings in Patients Who Voiced Symptoms of Nervousness, Anxiety and Easy Fatigueability.—Fifteen of the seventy-four patients gave symptoms of nervousness, anxiety, memory lapses and easy fatigueability. Of this group ten had normal E. E. G., three had slightly abnormal E. E. G. and two had greatly abnormal E. E. G.

Of the two that had greatly abnormal E. E. G., one complained of intermittent attacks of amnesia and sleep-walking. The other complained of poor memory and inability to concentrate. It is interesting that the remaining thirteen patients who had normal or slightly abnormal E. E. G. all voiced various other somatic complaints such as headache, dizziness, et cetera, in addition to their symptoms of nervousness, easy fatigueability and anxiety states.

5. E. E. G. Studies in Patients Who Voiced Headache as Their Only Complaint.—Of fourteen patients whose only presenting symptom was headache, eight had normal E. E. G., three had slightly abnormal E. E. G., and three had abnormal E. E. G.

6. E. E. G. Studies in Patients Who Voiced Headache plus Various Other Somatic Symptoms.—Of twenty-six patients who voiced headache in addition to other subjective symptoms including "blackout," dizziness, nervousness, et cetera, twenty-one had normal E. E. G., three had slightly abnormal E. E. G., and two had abnormal E. E. G.

7. Analysis of Patients Who Had Post-Traumatic Seizures.—Of the total group of seventy-four patients, nine (12 per cent) had suffered convulsive seizures since their head injuries. Of these nine cases, three had had their first seizure in less than six months after injury, four in from six to twelve months after injury, one in from twelve to eighteen months after injury, and one had had his first seizure over eighteen months after injury.

Of the nine patients who developed post-traumatic seizures, five showed greatly abnormal E. E. G., two of which were focal in the right and left frontal areas; three showed slightly abnormal E. E. G., one of which was focal in the right parietal area, and one showed a normal E. E. G. Of the five patients who showed gross abnormalities in the E. E. G., two showed defects in the frontal regions in their skull x-rays. Both of these patients had focal abnormalities in the frontal regions upon E. E. G. examination. One of these had a skull defect of the frontal bones, 2 inches in diameter. He was neurologically negative except for concentric constriction of visual fields, most marked in the left. The other showed a foreign metallic body in the left frontal region in his skull rays. He was neurologically negative except for enucleation of his right eye. Of the three who showed diffuse E. E. G. abnormalities, one showed a foreign body in the right frontal region by x-ray (he also had suffered osteomyelitis of his frontal bones after his injury). Another showed small metallic bodies (shrapnel) in the left parietal region by x-ray, and he had a right lower quadrant heminopsia. The fifth had a healed occipital scar but was otherwise neurologically negative, and his skull rays were negative.

Of the three patients who showed slightly abnormal E. E. G., one had focal E. E. G. findings in the right parietal area. X-rays of his skull showed a defect about 1 inch in diameter in the right parietal area. A splinter of bone had been removed from that area following his head injury, and it was observed that he had had a left hemiparesis for several days after the accident. His E. E. G. was done nineteen days after his last seizure. The other two were neurologically negative and had normal skull rays. They both showed slight diffuse abnormalities.

One patient had a normal E. E. G. He had had a head injury in 1937 and was unconscious three days. Skull rays showed an old fracture line in the right tempero-parietal region. Neurological examination at time of E. E. G. examination (seven years later) revealed a left homonomous superior quadrant defect and impaired olfactory sense. He had had his first seizure seven years after his head injury. The E. E. G. examination was done three months after his last seizure.

As previously stated, nine in the group of seventy-four men who gave a history of head injury had a diagnosis of post-traumatic epilepsy. Brief case histories of these nine patients are given.

Case Reports

Case 1.—This white man, twenty-seven years of age, was rendered unconscious for five minutes. Five months later he was observed in a grand mal seizure (June 28, 1945). An E. E. G. done nineteen days after his seizure was slightly abnormal with the maximum abnormalities in the right parietal region. He was neurologically negative at the time. Skull rays showed a defect about one inch in diameter in the right parietal region. He had a left hemiparesis for several days after the accident but no other symptoms.

Case 2.—This twenty-two-year-old private with two years' service received a head injury in 1939. First grand mal seizure occurred about a year later followed by two others, the last one on March 15, 1945. E. E. G. done four months after the last seizure was abnormal with the most marked abnormalities in frontal leads. Skull rays showed a defect 2 inches in diameter in the frontal bones. Neurological examination was negative except for concentric constriction of the visual fields, most marked on left.

Case 3.—This patient, aged twenty-five, received a penetrating wound by shell fragment in the frontal region on October 8, 1944. An E. E. G. eight months later was abnormal with most marked abnormalities in frontal region. Skull rays showed a foreign metallic body in the left frontal region. Patient had a sudden attack of amnesia a week prior to E. E. G. He was neurologically normal except for an enucleation of his right eye.

Case 4.—This thirty-year-old patient received a head injury in November, 1943. He was unconscious for an indefinite time. He had his first seizure two weeks later, December, 1943, and has had four to five severe "blackouts" and dazed attacks since. E. E. G., done June 19, 1945, was over two years after injury and two months after his last seizure. This was slightly abnormal, and it was noted that it was non-focal in type.

Case 5.—This twenty-year-old patient was in an automobile accident in 1940 and rendered unconscious for thirty hours. He had a healed occipital scar. Ten convulsive seizures were suffered from 1941 to April 1945. An E. E. G. done three months after the last seizure and five years after the head trauma was greatly abnormal and non-focal. The patient was neurologically negative.

Case 6.—This patient suffered a head injury in January, 1943, a steel wedge penetrating his right forehead. Osteomyelitis for three months and four convulsions, the first in 1944, were followed two years after injury by the first E. E. G. which was greatly abnormal. The neurological examination was negative. Skull rays revealed a small metallic foreign body in the right frontal region, intracranially situated. His E. E. G. which was taken some two years after his injury was found to be greatly abnormal but non-focal in type.

Case 7.—This thirty-two-year-old patient suffered a right tempero-parietal fracture in an automobile accident in 1937 and was unconscious for three days. An epileptic seizure followed about six years later. E. E. G. examination was performed seven years after injury but only several months after seizure. The tracing was normal. Neurological examination showed left homonomous superior quadrant defect and poor olfactory sensation.

Case 8.—This patient was struck in the left parietal region by a piece of shrapnel in late 1944 and he was unconscious for fifteen hours. His first seizure occurred March 30, 1945. On the following day an E. E. G. examination showed diffuse abnormalities. The seizure was right-sided. There have been two mild seizures since. E. E. G. ten months after accident and seven months after first seizure showed minimal abnormalities, diffuse. The patient was neurologically negative except for right lower quadrant heminopsia. Skull rays showed small metallic foreign body (shell fragment) in the left parietal area.

Case 9.—This patient was struck behind the right ear with a wine bottle in June, 1941, and was rendered unconscious for two weeks. The first seizure occurred eighteen months after the accident, the second in July, 1944, and the third in November, 1944. E. E. G. examination several days after last seizure revealed minimal abnormalities, non-focal. Neurological and skull-ray examinations were negative.

Analysis of 73 Cases without Electroencephalographic Studies.—These patients were analyzed in regard to objective and subjective neuropsychiatric residuals. Fifty-nine complained of headache alone and thirteen of dizzy spells or "blackout." All of the patients who had dizzy spells also complained of headache. Thirteen complained of memory defect or voiced symptoms of easy fatigueability and nervousness. Five complained of tinnitus in one or both ears. Organic neurological residuals were present in twenty-two patients or 30.1 per cent. Twenty had compound skull and brain wounds. Fifty-two had closed head injuries including lacerated scalp without fracture. One had an extradural hematoma (verified at operation). Eleven had compound skull and brain wounds with no obvious residuals. Nine had compound skull fractures with brain wounds with obvious neurological residuals. Four had post-traumatic epilepsy, and all of these had compound skull and brain wounds. Forty-nine of the seventy-three patients had periods of unconsciousness of varying duration. It was not recorded in eighteen instances, and six were never unconscious. All but one patient had various subjective complaints.

It is of interest that in this group headaches and dizziness were the two most common complaints. Nervousness, anxiety and lapse of memory were next in frequency. Less than half of the patients with compound injuries, many of them with retained metal fragments in their brains (confirmed by skull rays), had residual objective neurological findings.

Summary of Results

1. The results of the analysis of 147 cases of head injuries, 100 of which were of the closed type and forty-seven of which had sustained compound wounds of the skull with brain injury, are tabulated and discussed.

2. It was found that headaches and dizzy spells were the two most common subjective complaints. Seventy-three patients complained of headache alone and thirty-nine of headache plus some other subjective symptom.

3. The symptoms of nervousness, anxiety, memory lapse and easy fatigueability were next in frequency.

4. Analysis of the total group of 147 patients disclosed that 9 per cent developed post-traumatic epilepsy. Thirty-three per cent had residual objective neurological findings of various types, 67 per cent complained of headache, 26 per cent complained of "blackout" or "dizzy spells" and 19 per cent complained of nervousness, anxiety, memory lapse or easy fatigueability.

5. In the group of seventy-three patients who did not have E. E. G. studies, all complained of headache but one. Thirteen had in addition to their headache some other somatic symptom which in the majority of cases was dizziness. Of this group twenty had compound skull and brain wounds, forty-nine had closed head injuries including lacerated scalp without fracture, nine had compound skull and brain wounds with obvious neurological residuals, while eleven patients had compound skull and brain wounds with no obvious residual findings. Four of this group developed post-traumatic seizures.

6. Of the group of seventy-four receiving E. E. G. 51 per cent were normal, 26.2 per cent slightly abnormal and 22.8 per cent were greatly abnormal. Of the twenty-six patients who had compound skull and brain injury 46 per cent were normal, 23 per cent slightly abnormal and 31 per cent greatly abnormal. Of the remaining forty-eight with closed head injuries 56 per cent had normal, 29.4 per cent slightly abnormal and 14.6 per cent greatly abnormal E. E. G.

7. The time between the date of head injury and E. E. G. examination was under six months for twenty-nine of the cases, six to twelve months for eighteen cases and nine patients were examined twelve to twenty-four months after their injuries. Six of the patients had E. E. G. studies seventy-two months or more after their head injuries.

8. Of the total group nine (12.1 per cent) developed post-traumatic seizures. Six of these patients had sustained compound skull and brain injury while three had suffered from closed head injury (Table IV). Five had greatly abnormal E. E. G. (two of them focal in the right and left frontal areas), three had slightly abnormal E. E. G. (one with focal abnormalities in the

right parietal lead) and one had a normal E. E. G. Of the five patients with gross E. E. G. abnormalities two had defects in their skull rays in the frontal region. Both these patients showed focal E. E. G. abnormalities in the same area. One other had a skull defect in the frontal region and had a generalized abnormal E. E. G., as did one other with a foreign metallic body in his right parietal region. One of the cases with a slightly abnormal E. E. G. showed a skull defect in the right parietal region by x-ray and his E. E. G. abnormality appeared in the same region.

9. Seventeen or 23 per cent of the group of seventy-four had residual neurological findings, and of this group seven had greatly abnormal E. E. G., only one of which was focal; five had slightly abnormal E. E. G., only one of which was focal, and 5 had normal E. E. G. Of the five that were normal, two showed x-ray evidence of foreign metallic objects and one had a bony defect in the right temporal region. One of the seven patients with objective neurological residuals and greatly abnormal focal type of E. E. G. showed x-ray evidence of a foreign metallic body in the left occipital region. One of the cases with slightly abnormal E. E. G. showed x-ray evidence of a bony defect in the right parietal region.

10. Of the group of seventy-four who had E. E. G. studies, the length of unconsciousness was unknown in fifty-four. Of these, thirty-one had normal E. E. G., eleven had greatly abnormal E. E. G., and twelve had slightly abnormal E. E. G. Of the twenty patients who had known periods of unconsciousness four had greatly abnormal, nine slightly abnormal and seven had normal E. E. G.

Conclusions

1. The highest degree of E. E. G. abnormality was noted in those patients (nine in number) who developed post-traumatic epilepsy, as 90 per cent of these were found to have greatly abnormal or slightly abnormal E. E. G.

2. In the cases with focal abnormalities in the E. E. G. there was a definite correlation with the site of injury as shown by x-rays of the skull.

3. No correlation could be made as to focal abnormality in the E. E. G. and the objective neurological findings. This was most probably due to the fact that most of the head injuries in this series were severe, leaving diffuse residual lesions rather than those of a focal type.

4. In the group of cases where the length of unconsciousness was known there appeared to be no definite correlation between the E. E. G. abnormality and the length of unconsciousness.

5. The E. E. G. abnormality was 21 per cent greatly abnormal and 21 per cent slightly abnormal in fourteen patients who voiced headache as their only complaint, as compared with 8 per cent greatly abnormal and 11 per cent slightly abnormal in twenty-six patients who voiced headache plus one or more other subjective neuropsychiatric complaints.

6. Headaches, dizzy spells, nervousness, anxiety, memory lapse and easy fatigueability were the most common subjective complaints, with the E. E. G. abnormality being highest in those patients who voiced headache as their only complaint.

HEALTH EDUCATION

Health education and health services go hand in hand. Singly, they cannot do an effective job. Together, they complement each other and form an invaluable adjunct in the over-all health program. Health education without opportunities for medical consultation is sterile. Likewise, medical services exist in a vacuum unless they are called to the attention of the people.—TULA SALPAS, USPHS, *Indust. Hyg. Newsletter,* Aug., 1949.

PRIMARY TUMORS OF THE OPTIC NERVE

~~Report of Two Cases of Glioma~~

RICHARD C. HORNS, M.D.
Minneapolis, Minnesota

PRIMARY tumors of the optic nerve may be divided into two main groups: intradural tumors (gliomas) and tumors of the nerve sheaths (meningliomas, or endotheliomas). The first full pathological examination of a tumor of the optic nerve was published by Van Graefe (1866). These tumors are rare. There have been less than 350 cases reported in all the medical literature.[4] Verhoeff[10] states that prior to 1932 only 300 cases were recorded. A survey of these cases in the literature shows that 80 per cent were gliomas, 17 per cent were meningiomas and 3 per cent were fibromas.[1]

Gliomas of the optic nerve usually occur during the first decade of life and many occur before the age of five years. From 85 per cent to 90 per cent occur before the age of twenty. They have a ratio of occurrence to choroidal sarcoma (malignant melanoma) of 1:200.[11] Most of these tumors are intraorbital but some have been reported in the intracranial portion of the nerve, and in the chiasm. These tumors tend to spread along the nerve so the point of origin is often obscure.

Meningiomas of the optic nerve sheaths, like meningiomas elsewhere, tend to occur later in life than gliomas do, and the symptoms usually develop after the first decade of life. More than 50 per cent occur after the age of thirty years. Meningiomas arising intraorbitally are extremely rare, and there are some observers who question whether they ever arise within the orbital cavity. Such origin, however, has been reported by Byers,[2] Hudson,[6] and more recently by Stallard.[8] Intracranial meningiomas of anterior and middle cranial fossae frequently extend into the orbit.

Fibromatosis and malignant melanoma arising in the optic nerve occur most frequently during adult life but are extremely rare tumors. Malignant melanoma arising in the choroid, however, is a fairly common tumor.

The female sex is more prone to develop optic nerve tumors. Hudson's series[6] shows a proportion of female to male of 70 to 43 in gliomata, 20 to 7 in meningiomata, and 5 to 1 in fibromata.

The signs and symptoms of optic nerve tumor depend on the site of origin of the tumor. When the tumor arises from the orbital portion of the optic nerve, there is slowly progressing unilateral exophthalmos along with profound visual loss. The exophthalmos is only partially due to the tumor mass itself. The reaction of other tissues of the orbit also add to the exophthalmos. Usually there is profound visual loss before the exophthalmos appears. However, in some cases of meningioma of the nerve sheath, vision is not destroyed until late. There is no impairment of the ocular muscle function until the exophthalmos has become quite marked. In the case of glioma there is a painless exophthalmos with the eye pushed straight forward while in many cases of meningioma, the eye is pushed down and in or down and out. This is because the meningioma has more of a tendency to expand into the orbit transverse to the nerve, while the glioma tends to spread along the nerve. There is no pulsation and a bruit is not heard over the area.

Primary optic atrophy or a papilledema is seen on ophthalmoscopic examination. The papilledema is due to venous obstruction which produces hemorrhages about the disc, elevation of the disc, white exudates and eventually a secondary optic atrophy. There are some cases of optic nerve tumor reported in which the ophthalmoscopic examination has been normal. A very striking feature of primary optic nerve tumor is the fact that visual loss is extremely great in comparison with the extent of primary optic atrophy or papilledema. A patient may have only a moderate degree of papilledema or primary optic atrophy and have no light perception or only very poor light perception.

Tumors limited to the intracranial portion of the optic nerve almost invariably produce a primary optic atrophy, but cases have been reported in which an ophthalmoscopic picture of unilateral papilledema was produced. I do not know the mechanism by which the papilledema is produced in these cases. Bilateral papilledema occurs only if the tumor is large enough to increase intra-

Inaugural thesis presented before the Minneapolis Academy of Medicine, Minneapolis, Minnesota, December 19, 1949.

The author is indebted to Dr. William Peyton for helpful suggestions in preparing this paper.

cranial pressure, and may do so by its own mass or by obstruction to the circulation of cerebrospinal fluid.

The visual field examination is usually of little help in primary tumors of the optic nerve because the patient usually presents himself with one blind eye and a normal field in the other, but visual field examination is of great significance in tumors of the intracranial portion of the optic nerve which extend into the optic chiasm. In this case a field defect, usually a temporal hemianopsia, is found in the opposite eye.

Roentgenographic examination is of great importance in studying these cases. Gliomas of the optic nerve usually arise intraorbitally and extend centrally through the optic foramen very frequently enlarging the optic foramen. This finding of a unilateral enlargement of an optic foramen is of importance both diagnostically and from the standpoint of treatment.

Usually there are no x-ray findings in tumors limited to the intracranial portion of the optic nerve, but when the tumor becomes large there will be erosion of the anterior and posterior clinoid processes, deformity of the sella turcica, and erosion of the sphenoid ridge. The diagnosis of intracranial glioma of the optic nerve and chiasm is extremely difficult. Martin and Cushing[1] were able to suspect the condition in only one out of their seven cases.

The course of both gliomas and meningiomas is that of slow, steady gradual progression over a period of years. Temporary periods of rapid growth have been reported. The ultimate result if untreated is death due to intracranial extension. Neither gliomas or meningiomas metastasize.

On microscropic examination of gliomas, the essential neoplastic cell is a uni- or bi-polar spongioblast. These cells are spindle-shaped with oval nuclei and straight or sometimes corkscrew-like processes arising from each end. Verhoeff[9] described three main types, all of which may undergo transition from one into the other. These types are a finely reticular type similar to normal neuroglia, an exaggerated coarse reticular type, and a sickle-shaped cell type made up of course neuroglial fibers. Sometimes mitotic figures are seen. Cysts filled with mucinous-like substance are frequently found and may be very numerous. Because of this these tumors have been called myxiomas in the older literature, but this material does not show the staining reaction for mucin (Fleischer and Scheere[5]). Usually the septa are enormously thickened and made up of collagenous fibers arranged in an irregular manner into which glial fibers grow in all directions. The nerve fibers are spread apart compressed and stretched and as a rule are demyelinized at an early stage.

The microscopic examination of meningiomata of the optic nerve-sheaths shows cells with large vesicular nuclei and pale staining cytoplasm. These cells are arranged in syncytial masses, irregular lobules or ill-defined columns with a tendency to an arrangement in whorls. These are typically endothelial cells and arise from either the endothelial cells lining the sub-dural space or from the cells covering the arachnoid. These meningiomas tend to expand into the orbit and neighboring structures, but do not break through the pia to invade the optic nerve. The nerve fibers are damaged only by compression.

There have been several reports in the literature of glioma of the optic nerve associated with diffuse neurofibromatosis of Von Recklinghausen.

The treatment of primary tumors of the optic nerve is surgical. If the tumor is limited to the orbit, the blind eye together with the optic nerve and tumor may be enucleated. In some cases the globe has been retained by entering the orbit from the lateral side by means of the Krönlein operation. Also by means of a transconjunctival approach or through a skin incision made along the outer or upper orbital margin, the orbit can be explored fairly well. But a much better exposure of the lateral side of the orbit is obtained with the Krönlein operation. There are two main disadvantages to these transorbital approaches to the removal of these tumors. They are, first, the difficulty of complete excision of the tumor if it extends well into the apex of the orbit and, second, the danger of a cerebrospinal fluid leak into the orbit with ensuing meningitis.

If x-ray examination or exploration of the orbit by one of the above procedures demonstrates that the tumor has extended through the optic foramen, then intracranial operation should be considered. This is done through the transfrontal route (Dandy, Martin and Cushing[3]). The orbit is unroofed and the tumor is excised. If the globe must also be excised, this should be done after complete healing has taken place. X-ray therapy is of very limited value in the treatment of these tumors.

Two cases of primary tumor of the optic nerve from the neurosurgical and ophthalmological services at the University of Minnesota Hospital are presented.

Case 1.—A forty-one-year-old white woman was admitted to the University Hospital on January 29, 1946, and discharged on February 8, 1946. Her complaints on admission were failing vision in the right eye, frontal and occipital headaches, tinnitus, and paresthesia of the hands and feet. The chief complaint, however, was the failing vision in the right eye, gradually progressive since it was first noticed three months previously. The other symptoms had been present for three years. The general physical examination was negative with the exception of slightly reduced abdominal reflexes and slight extensor response to the Babinski test on the left. Routine laboratory work was done and found to be normal. Ophthalmoscopic examination revealed a 3 diopter papilledema in the right eye. There was venous engorgement and there were several small hemorrhages about the disc. In the left eye there was a slight elevation of the disc, but otherwise it was normal. The vision was 20/400 in the right eye and normal in the left. Visual field examination showed general depression for the right, but was normal for the left eye. The ventriculogram was normal. A diagnosis of multiple sclerosis was made, and the patient was put on histamine and discharged.

Vision continued to fail in the right eye, and for this reason she was readmitted on April 25, 1946, when it was found that vision was merely light perception in the right eye. A 3 to 4 diopter papilledema was again found in this eye.

The left eye was normal. Neurological examination revealed deep reflexes on the left, more active than on the right. It was thought that the patient probably had a sphenoid ridge tumor on the right. A transfrontal craniotomy exposed a tumor of the right optic nerve. This tumor extended from the optic foramen to the chiasm. The involved optic nerve was enlarged to about 1 cm., and just behind the optic foramen on the inferior surface of the nerve there was an additional bulbous enlargement. The tumor was excised as close to the chiasm as seemed safe without endangering vision in the other eye. The distal section of the optic nerve was made anterior to the optic foramen. It was felt that complete removal was impossible without severely damaging the optic chiasm. Microscopic examination showed the tumor to be a glioma made up of a diffuse proliferation of astrocytes. The patient was discharged on May 8, 1946. The patient was last seen in January, 1950 (three and one-half years after operation). She was well and working in a department store. Her only symptom was blindness of the right eye. On examining her eyes it was found that there was a secondary optic atrophy of the right optic nerve. There was no light perception in the right eye. The left eye was normal, her vision was 20/20 and no field defect could be detected on the perimeter with a 3 mm. white test object at 330 mm. or on the tangent screen with a 1 mm. white test object at 1000 mm.

Case 2.—The second case is that of a five-year-old white boy who was first seen at the University Hospital on March 24, 1949. The parents stated that the right eye had been very prominent for the past two weeks. It is probable that some exophthalmus was present for a considerably longer time than this. The mother had noticed that for the past two years the right eye would drift out when the child would look in the distance. A few days before admission the father had discovered that the child could not see with the right eye. No other symptoms were noted. The right eye on measurement was found to have an exophthalmos of 2 mm. as compared to the left eye. There was no light perception in the right eye, and the eye was turned outward and downward. There was limitation of motion when the eye was turned upward and outward. On examining the eye grounds, it was found that there was engorgement of the veins of the right eye and a papilledema of from 4 to 5 diopters. The left eye was normal. The physical examination was otherwise normal and routine laboratory work was negative. A ventriculogram gave normal findings. It was thought that the boy had some type of an orbital tumor, and on March 30, 1949, a right transfrontal craniotomy was performed. The right orbit was unroofed but the capsule was not opened and no tumor was found. After the operation the boy got along well, but the exophthalmus progressed so that by September 29, 1949, the exophthalmus of the right eye measured 6 mm. as compared to the other eye. The boy was readmitted to the hospital on November 14, 1949. A second craniotomy was done and the right orbit again explored through a right transfrontal craniotomy and the capsule of the orbit opened. A tumor of the optic nerve which extended from the globe to the optic foramen was found. This tumor was fusiform in shape and was about 12 mm. across at its widest portion. The tumor had elongated the optic nerve so that it was coiled upon itself within the muscle cone. It was excised at the globe and dissected free to the optic foramen where the nerve was again cut across. Because there was some question of the tumor possibly having extended through the optic foramen, an additional portion of the nerve within the optic foramen and proximal to the optic foramen was excised. Postoperatively, the patient has gotten along well. At the present time there is a ptosis on the right, and the right eye has remained somewhat irritable. Microscopic examination of this tumor showed glial cells, and a diagnosis of astrocytoma was made by the pathologist.

THE SURGICAL MANAGEMENT OF MASSIVE HEMORRHAGE FROM GASTRIC AND DUODENAL ULCERS

DONALD C. MACKINNON, M.D.
Minneapolis, Minnesota

THE PURPOSE of this report is to review the clinical aspects of severe bleeding from the stomach and duodenum, and to report twenty-three cases of massive hemorrhage requiring emergency operations. All of the patients were admitted to the Minneapolis Veterans Hospital during a three-year period from April, 1946, to April, 1949.

In the literature there is confusion over the true meaning of the term "massive hemorrhage." Recent publications attempt to define, clarify, and restrict the term to a specific clinical picture. Amendola[4] believes that it implies a rapidly progressive exsanguination, and should be applied to a rapid loss of blood of such proportions as to cause unmistakable signs and symptoms of hemorrhagic shock. Hoerr, Dunphy, and Gray,[17] in defining their exsanguinated cases of massive hemorrhage, stressed the importance of shock, and the failure to stabilize the circulation with a limited number of blood transfusions. When the term is used in a less restricted sense, bleeding is extensive but less rapid, causing milder symptoms and signs of shock, with marked reductions in the hemoglobin, red cell, and hematocrit determinations. Such hemorrhages are an immediate threat to the life of the patient.

The cases reported in this review were grouped as moderate, severe, and exsanguinating forms of massive hemorrhage. This classification was based on the degree or severity of the following factors: presence of shock, rate of bleeding, persistence of hemorrhage, and recurrent episodes of acute massive bleeding. Since the limits of each group cannot be defined precisely, one encounters considerable difficulty in assigning the borderline cases to the proper group. The cases with moderate hemorrhage were patients with an episode of mild shock, a short period of bleeding at a rate not greater than 500 to 1,000 cubic centimeters of blood in twenty-four hours. Ordinarily these patients recover with proper medical management. Those grouped as severe massive hemorrhage had one episode of shock, bled for a longer period of time but at a rate not greater than 1,500 cubic centimeters of blood in twenty-four hours. If they were given 1,000 to 1,500 cubic centimeters of blood daily, they appeared to be in good circulatory balance. Some of these patients may recover when treated medically. They require close observation, and when the rate of bleeding increases, as evidenced by shock and an episode of acute massive hemorrhage, surgical intervention is indicated. The cases classified in the exsanguinating group were patients who may or may not have had long periods of steady bleeding but who bled at a rate greater than 1,500 cubic centimeters of blood in twenty-four hours. These were the patients with one or two episodes of acute massive hemorrhage with marked shock and an unstable circulation despite transfusions of 500 cubic centimeters, or more, of blood every eight hours.

Incidence and Mortality

Warren and Lanman,[32] in a comprehensive review of the literature, found that in patients admitted to the hospital for ulcer, the incidence of hemorrhage of any degree ranged from 11 to 40 per cent. The incidence of massive hemorrhage in the same group of collected figures was between 9 and 18 per cent. They explained the wide range of mortality under medical management (from 3 to 24 per cent) on the basis of whether the reports include cases with hemorrhage of any degree or only those with massive hemorrhages. In discussing surgical mortality rates, these authors further stressed the importance of knowing not only the degree of hemorrhage but at what time during the course of bleeding the operation was undertaken. Their collected mortality rates following operation for bleeding peptic ulcer ranged from 4.1 to 42.8 per cent, and this wide range seemed to be explicable solely on the basis of the varying degrees of exsanguination of the patients at the time of operation. In summary, these authors state that approximately 25 per cent of the patients admitted to the hospital for peptic ulcer have bleeding as a symptom, and approximately 10 per cent of all such admissions have massive hemorrhage. The mortality in all patients admitted for massive hemorrhage and treated medically is between 5 and 10

Read at the Surgical Staff Seminar of the Minneapolis Veterans Hospital, May 3, 1949.

Published with permission of the Chief Medical Director, Department of Medicine and Surgery, Veterans Administration, who assumes no responsibility for the opinions expressed or conclusions drawn by the author.

per cent. The mortality following operation for bleeding ulcer may be as low as 5 per cent if the patients are operated upon within twenty-four hours, or if elective operations are included, but it has approached 50 per cent if one considers those patients in a state of exsanguination and upon whom operation followed a prolonged and unsuccessful attempt at conservative management.

Other reports substantiate the dangers of massive hemorrhage. In Heuer's[20] series of 337 patients with serious or massive hemorrhage from peptic ulcer, forty-nine (15 per cent) of the patients presented a fatal type of hemorrhage. Amendola[4] reported eighty-four patients with massive hemorrhage treated expectantly with a mortality rate of 15 per cent. Bergh, Hay, and Trach[6] collected 2,565 patients with massive hemorrhage treated medically and found the mortality to be 10.2 per cent. For 214 patients treated surgically, the mortality was 29.8 per cent.

Recent publications indicate that the present nonoperative mortality rate in severe and massive hemorrhages has been lowered by more adequate blood replacement. Costello[10] reported a 4 per cent mortality; Fraser and West[14] found a 4.2 per cent mortality, while Meulengracht[25] gave the death rate under his free feeding regime as 2.5 per cent. For a clearer interpretation of mortality figures, there is a need for separating patients with severe hemorrhage from those with exsanguinating hemorrhage, as indicated by Hoerr, Dunphy, and Gray.[19]

The mortality following massive hemorrhage from peptic ulcer increases with the age of the patient. In patients under forty-five years of age the risk is less, though probably not nearly as slight as some reports indicate. In the younger age group, Bohrer[9] reported 548 patients with severe acute hemorrhage treated conservatively. The mortality rate below the age of forty-five years for bleeding gastric and duodenal ulcers was 20 per cent and 6 per cent respectively. Hansen and Pederson[16] found that of 393 patients with fatal hematemesis and melena in Copenhagen hospitals during a period from 1915 to 1937, 13 per cent were under forty years of age. In the group over forty-five and fifty years of age, Allen and Benedict,[3] Blackford and Williams,[8] and Chiesman[10] report mortality rates varying from 25 to 33 per cent. Jankelson and Segal[22] found the average age of patients with fatal bleeding ulcer to be fifty-four years. Meulengracht[25] recently reported twenty-six medical fatalities, twenty-five being over forty years of age and over half being over sixty. Holman[18] attributes the higher mortality in the older individuals to their greater susceptibility to complications and to the higher incidence of arteriosclerosis with failure of the eroded vessels to retract. He also found that the increased mortality among the older patients was not related to the chronicity of the ulcer.

TABLE I—COMPARISON BETWEEN MORTALITY RATES FOR BLEEDING DUODENAL AND BLEEDING GASTRIC ULCER (SANDUSKY AND MAYO[26])

Author	Duodenal per cent	Gastric per cent
Segal, Scott, Stevens[27]	3.7	30.0
Alberhart[1]	7.0	50.0
Welch and Yunick[33]	6.3	35.3
Sandusky and Mayo[26]	5.4	30.0

TABLE II—A COMPARISON BETWEEN THE MORTALITY RATES OF EARLY AND LATE OPERATION

Early Operation

Author	Cases	Deaths	Mortality per cent
Finsterer[13]	72	4	5.1
Heuer[20]	21	2	9.5
Gordon-Taylor[15]	18	1	5.5
Amendola[4]	11	1	9.0

Late Operation

Author	Cases	Deaths	Mortality per cent
Finsterer[13]	74	22	30.0
Heuer[20]	10	7	70.0
Gordon-Taylor[15]	11	4	36.0

The seriousness of recurrent episodes of massive hemorrhage is stressed by Holman[18,19] and Hunt.[21] The first hemorrhage also carries a considerable risk. Allen[2] reported a 45 per cent mortality from the first hemorrhage in his fatal cases. Blackford and Allen[7] found that 77 per cent of their fatalities occurred during the first bleeding episode.

The location of the ulcer is another factor influencing the mortality. Sandusky and Mayo[26] report three series of cases, in addition to their own, in which the mortality rates were calculated separately for gastric and duodenal ulcers. Table I shows that the mortality rate for combined medical and surgical treatment in bleeding gastric ulcer is five to eight times as great as that in bleeding duodenal ulcer.

Difficulties arise in evaluating the risk of surgical intervention because the number of contributions to the literature is small, and the statistical data are compiled upon patients with variable degrees of hemorrhage. Finsterer[13] was the first to show that in patients operated upon within forty-eight hours after the onset of hemorrhage, the mortality rate was significantly lower than in those patients operated upon later. Other reports have recently appeared in the literature to substantiate the fact that the mortality rate decreases when the period of medical treatment is shortened. Table II clearly shows the lower mortality in early operation, many patients being operated upon within twenty-four hours of the onset of bleeding.

Difficulty also arises when mortality figures of medical management are compared with surgical mortality rates. The two groups are not strictly comparable. Many patients operated upon early might have ceased bleeding had medical treatment been continued. Early operation can be justly criticized when performed on patients with only a moderate degree of acute hemorrhage. Conversely, when operation is performed late, after a prolonged period of medical management has failed, or as a last resort, the surgical mortality rate may be exceedingly high. Such cases should not be reported in terms of mortality rates but in terms of lives saved. These cases represent pure salvage; that is, the patients would not have recovered without operation.

Etiology and Pathology

Since the etiology of acute bleeding depends upon the presence of the ulcer, a definite underlying cause is unknown. Persistent slow bleeding and occasionally severe hemorrhage may be from the ulcer wall due to the erosion of small vessels in the submucosa or deeper layers of the stomach or duodenum. A massive hemorrhage can arise from a small anterior wall gastric or duodenal ulcer. The fact is well established that fatal hemorrhages are often due to penetrating posterior duodenal wall ulcers with erosion of larger vessels, such as the gastroduodenal and pancreaticoduodenal arteries. If the fatal bleeding is of gastric origin, the ulcers penetrate the gastrophepatic ligament or pancreas since they are usually located on the lesser curvature or posterior wall. They may produce an erosion of the right or left gastric arteries, and rarely of the splenic artery.

The ulcer is usually deep and hard, with a base of dense fibrous scar tissue. In the base of the ulcer there may be a thickened sclerotic artery with a loosely attached occluding blood clot. The digestion and dislodgment of the blood clot will produce recurrent episodes of bleeding. The sclerotic vessel surrounded by dense fibrous tissue in the ulcer base prevents retraction of the vessel and interferes with the natural mechanism of hemostasis.

Occasionally the source of bleeding is obscure and not visible to the surgeon but may be demonstrated by careful gross and microscopic examination of the resected specimen. A gastritis is frequently associated with gastric and duodenal ulcers. Rarely, when the ulcer is not found, a severe antral gastritis with or without ulceration will be the source of bleeding.

In 231 cases of sudden massive hemorrhage, Allen[2] found the lesions that caused the bleeding to be the following: duodenal ulcer, gastric ulcer, gastric carcinoma, esophageal varices, gastrojejunal ulcer, gastritis, and leiomyosarcoma.

Diagnosis

The problem of determining the source of bleeding may be a difficult one. As desperate as these cases may seem, every reasonable effort should be made to establish the diagnosis during the period of medical management and blood replacement.

The history may disclose a presumptive or a positive diagnosis of gastric or duodenal ulcer. A bleeding gastrojejunal ulcer is strongly considered when the patient has had a previous gastroenterostomy. A carefully taken history and a complete physical examination may suggest a gastric carcinoma or cirrhosis of the liver with bleeding esophageal varices. Useful information can be obtained from liver function tests within twenty-four hours. However, the diagnostic and therapeutic problem is frequently so urgent that many of these procedures are not done. Gastroscopy may be dangerous, unwise, and often impossible. Heuer[20] had three fatal cases of recurrent massive hemorrhage follow fluoroscopic examination and is opposed to it. On the contrary, Hoerr, Dunphy, and Gray,[17] and Amendola[4] advocate a swallow of barium with fluoroscopic and x-ray examination of the esophagus, stomach, and duodenum performed without palpation or pressure as a final diagnostic effort. Obviously, the patient should not be in shock during this examination. If necessary, the examination can be done during a blood transfusion. Allen[2] found the x-ray examination of the esophagus by the method of Schatzki of value in the diagnosis of esophageal varices. Fluoroscopic examination was performed in a few of our cases without dangerous consequences. Though the examination has obvious limitations, it helped in two cases to demonstrate lesions which were confirmed later.

Management

The management of patients with massive hemorrhage from the stomach and duodenum requires teamwork and close observation by both the internist and the surgeon. Since the initial treatment is medical, the patients are admitted to the medical service of most hospitals. The greatest single advancement in medical therapy has been the liberal use of blood transfusions, with emphasis on complete blood replacement. The patient's appearance and reaction to the blood loss are noted. The pulse and blood pressure are taken at fifteen minute intervals and recorded. An attempt is made to ascertain the source of bleeding. If bleeding stops permanently, medical management is continued and elective surgical intervention is considered later. Further discussion of medical therapy is not a part of this review.

To differentiate patients in whom the hemorrhage is likely to prove fatal, or those needing surgical intervention, from those in whom it will cease under proper medical therapy, has proved most difficult. This is due to the variable course taken by these patients and the different reactions of patients to the blood loss. The course of the hemorrhage falls into two main groups: (1) intermittent bleeding, and (2) continuous bleeding. There are periods of acute recurrent massive hemorrhage occurring in either group. Such a variable pattern in the course of a bleeding episode is a warning that a sudden fatality from exsanguination may occur at any time.

Surgical Indications

A clearer definition of the surgical indications is urgently needed. Which patient should be operated upon, and when should the operation be performed? These are the basic points in the management of these cases and remain most difficult to solve.

There are important factors in addition to the age of the patient and the duration of bleeding that help to determine which patient should be submitted to operation. These important criteria are the presence of syncope or shock, clinical evidence of persistent bleeding, and clinical evidence of acute recurrent episodes of massive hemorrhage. Patients who continue to bleed following a massive hemorrhage, and/or have a second massive hemorrhage within a day or two, constitute a dangerous group in which sudden fatalities may occur despite desperate efforts to replace blood. Persistent or recurrent shock is an exceedingly ominous sign associated with severe uncontrolled bleeding.

Shock is present when tachycardia, hypotension, pallor, sweating, fainting, or cold clammy extremities are observed. Shock may not be apparent until the pulse and blood pressure are taken after the patient has been in the upright position for a few minutes.

When the patient is bleeding acutely and blood is being replaced, the hemoglobin, red cell, and hematocrit determinations are not reliable. On admission to the hospital and during an interval between bleeding, these determinations are more accurate estimations of the degree of exsanguination.

Hoerr, Dunphy, and Gray[17] have stressed the importance of the rate of hemorrhage. Their concept implies a time factor, and they believe that the rate of blood loss is more important than the quantity of blood loss. It is their opinion that patients who fail to maintain a stable circulation despite continued transfusions of not more than 500 cubic centimeters of blood every eight hours are considered to be in a state of exsanguinating hemorrhage. It is their belief that these are the patients upon whom surgery must be employed. Therefore, the rate of bleeding and recurrent syncope or shock are extremely valuable factors that should be considered in making the decision to operate. If operation is delayed in the presence of these ominous signs, the mere replacement of blood may fail to fortify the patient to withstand a major operative procedure.

Hoerr, Dunphy, and Gray[17] believe that immediate transfusion and early operation is justifiable in selected young patients in good condition who are bleeding moderately. This plan not only checks the bleeding but also provides the corrective subtotal gastrectomy. If such a patient is seen late in the course of a hemorrhage, it is wiser to apply the previously mentioned criteria for operation.

When the decision to operate is made, the patient is prepared for emergency operation by rapid and massive blood transfusions and transfusion is continued throughout the operative procedure.

Operative Procedures

Palliative operative procedures to control hemorrhage such as ligation of the larger arteries supplying the ulcer, and ligation of the bleeding vessel in the base of the ulcer by transfixion or encircling sutures have not proved uniformly successful when used as the sole measure to control hemorrhage. Following suture of the bleeding vessel in the ulcer base, the ligature may cut through or be digested, resulting in a recurrence of hemorrhage during the first or second week after operation. When an active bleeding point is found in a non-resectable, penetrating ulcer, ligation of the vessel for the immediate arrest of hemorrhage is a valuable adjunct to subtotal gastrectomy.

When the bleeding ulcer is located high on the lesser curvature of the stomach, Heuer[20] prefers local excision of the ulcer rather than ligation because it is a better procedure for permanently controlling the hemorrhage. Gastric and duodenal ulcers adjacent to the pyloris cannot be excised locally and repaired without the danger of obstruction, which necessitates an additional procedure, preferably a gastrojejunal anastomosis. In these cases he recommends subtotal gastrectomy.

Amendola[4] believes that with adequate blood transfusion and modern anesthesia, a patient who cannot be safely conditioned for major gastric surgery should not be subjected to the added risk of an operative procedure. Subtotal gastrectomy with excision of the ulcer is the procedure of choice from the standpoint of controlling hemorrhage and permanently curing the patient.

Situations arise in which a large, fixed penetrating ulcer located on the posterior wall of the duodenum or stomach cannot be excised. The adhesions and firm fixation of these ulcers to the pancreas and the common bile duct make their removal hazardous and increases the risk of the operation. A fixed penetrating posterior duodenal wall ulcer may be excluded, left in situ, and the duodenum proximal to the ulcer closed by employing the technique of Wangensteen.[29] When the ulcer is near the line of resection, making the duodenum difficult to close, Wangensteen[28] prefers to seal the posterior duodenal perforation by suturing the anterior wall of the duodenum to the edge of the fixed posterior wall and capsule of the pancreas so as to roll the anterior wall into the perforation and pancreas. The exclusion operation is then followed by subtotal gastrectomy. If the penetrating posterior duodenal wall ulcer is not resectable and is located high, immediately adjacent to the pylorus, the ulcer base may be left behind and the resection performed around it. The duodenum distal to the ulcer is then mobilized sufficiently to permit adequate closure of the duodenal stump. In such cases the technique of Judin reported by Gordon-Taylor[15] has been recommended as an alternate procedure for closing the duodenal stump. In Judin's technique the duodenum is freed from the base of the penetrating ulcer and closed into a conical form with a continuous suture. The cone is converted into a snail-like form which is employed as a tampon of the ulcer base as it is sutured to the capsule of the pancreas. The closure of the duodenum in any of the penetrating ulcers may result in an exceedingly difficult and laborious task. A wiser choice may be a transection of the stomach 4 or 5 centimeters proximal to the pylorus, excision of the antral mucosa, and closure of the pylorus and gastric stump according to the technique of Wangensteen.[30] McNealy[24] advocates plicating or folding in the anterior wall of the duodenum so as to act as a tampon to the ulcer crater. McKittrick[23] uses a two-stage operation in some of these difficult cases. He removes the gastric antrum at a second stage following the performance, in selected cases, of a first-stage exclusion and partial gastrectomy. When a large gastric ulcer penetrates the pancreas and is not resectable, the ulcer can be left behind and a subtotal gastric resection performed around it.

A controversial therapeutic problem arises when the source of bleeding cannot be found after a careful exploration of the gastrointestinal tract. Amendola[4] believes that if the source of bleeding cannot be found after thorough inspection of the duodenal and gastric mucosa, the stomach and duodenum should simply be closed without further operative procedure. A small ulcer high on the lesser curvature or low in the duodenum may be overlooked by this method of examination. Wangensteen[28] has observed small posterior duodenal wall ulcers that cannot be felt or seen until the duodenum is separated from the pancreas. These occult posterior duodenal wall ulcers should be considered in cases where the cause of gastrointestinal hemorrhage remains obscure. In Wangensteen's[31] Listerian Lecture, cases of massive hemorrhage were cited which were due to superficial gastric erosion, arterial thrombosis of a gastric vessel, or ulcerative gastritis. In the presence of the acid-peptic digestive activity of the gastric juice, these lesions have been observed to be the source of bleeding. Wangensteen[31] states that occult hemorrhage from the alimentary canal frequently has its origin in the stomach and recommends subtotal gastric resection as the therapeutic measure in many such instances. Therefore, subtotal gastrectomy may be indicated purely on the basis that the stomach and duodenum are the most likely sites of obscure, occult hemorrhage. Many surgeons may criticize or question the advisability of doing so formidable a procedure on such meager indications. In all probability an unnecessary gastrectomy may be eventually done when this plan is followed, but, in the end, more lives may be saved.

Review of Cases

Although the number of cases of massive hemorrhage treated by emergency subtotal gastrectomy at the Minneapolis Veterans' Hospital over a three-year period from 1946 to 1949 is small, a total of twenty-three cases, there are certain instructive clinical points of interest shown in the following review.

A. *Sex*
All or 100 per cent of the patients were males. Such a sex incidence is to be expected in a hospital of this type.

B. *Age*
Range, 24 years to 72 years
Average age—47.2 years
Under 45 years of age, 10 cases—43.5%
Over 45 years of age, 13 cases—56.5%

C. *History of Uulcer*
Positive, 13 cases—56:5%
Suggestive, 7 cases—30.4%
None, 3 cases—13.1%

D. *History of Massive Hemorrhages*
First hemorrhage, 16 cases—69.5%
Second hemorrhage, 4 cases—17.4%
Third hemorrhage, 3 cases—13.1%

E. *Lowest Hemoglobin and Red Cell Determinations*
A hemoglobin of 8.8 grams or a red cell count of 2,500,000 and over, 13 cases—56.5%
Under that amount, 10 cases—43.5%

F. *Duration of Bleeding Preoperatively*
Range, 12 hours to 32 days
Under 48 hours, 6 cases—26.1%
Over 48 hours, 17 cases—73.9%

G. *Shock*
One episode of shock, 15 cases—65.2%
Two episodes of shock, 8 cases—34.8%

H. *Amount of Blood Preoperatively*
Range, 1,000 c.c. to 8,500 c.c.
Average, 3,826 c.c.

I. *Amount of Blood During Operation*
Range, 100 c.c. to 2,500 c.c.
Average, 1,383 c.c.

J. *Classification or Group*
Exsanguinating hemorrhage, 15 cases—65.2%
Severe hemorrhage, 6 cases—26.1%
Moderate hemorrhage, 2 cases—8.7%

K. *Site of Bleeding*
Duodenal ulcer, 11 cases—47.8%
Gastric ulcer, 8 cases—34.7%
Gastritis, 3 cases—13.1%
Undetermined, 1 case—4.4%

L. *Operative Procedure*
Subtotal gastrectomy, excision of ulcer, or source of bleeding, 13 cases—56.5%
Subtotal gastrectomy, exclusion of ulcer, 9 cases—39.1%
Subtotal gastrectomy, site undetermined, 1 case—4.4%

M. *Complications*
Five complications in 5 cases—21.7%

1. Phlebothrombosis left leg, ligation of left superficial femoral vein
2. Partial wound disruption, secondary closure of the wound
3. Wound infection
4. Hepatitis, homologous serum jaundice following administration of plasma for shock by the patient's local physician before admission to the hospital
5. Postoperative hemorrhage for 24 hours, stopped spontaneously

N. *Mortality Results*
Mortality, all cases—23 cases, 2 deaths—8.7%
Mortality, exsanguinating cases, 15 cases, 1 death—6.7%
Mortality, moderate and severe cases, 8 cases, 1 death—12.5%
Mortality according to age:
  Under 45 years, 10 cases, no deaths
  Over 45 years, 13 cases, 2 deaths—15.4%
Mortality according to time of operation:
  Early operation (under 48 hours) 6 cases, 1 death—16.7%
  Late operation (over 48 hours) 17 cases, 1 death—5.9%

O. *Causes of Death*
First case—Atelectasis, peritonitis, toxemia, shock (no autopsy)
Second case—Luetic aortitis, heart block, sudden death on operating table—(autopsy)

Discussion of Cases

With the exception of two cases of moderate hemorrhage, all cases in this report were examples of severe and exsanguinating hemorrhage. The indications for operation in these patients were individualized, based on the degree and rate of hemorrhage. Syncope or a period of hypotension and tachycardia constituted shock, which was an important sign and was present in all patients. Recurrent shock was the most valuable single sign. Failure to stabilize the circulation with 500 cubic

TABLE III.

No.	Admission	Age Sex	History of Ulcer	Massive Hemorrhages	Lowest Hgb RBC Hematocrit	Shock	Duration of Preoperative Bleeding	Blood Given Preoperatively	Blood During Operation	Classification
1.	4/25/46	51 M	Suggestive	First	5.3 gms. (33%) 1.9 million —	Once	32 days	5,000 cc.	2,000 cc.	Exsanguinating

TABLE III.

Surgical Indications	Bleeding Site	Operative Procedure	Result	Complications	Comments
Severe hemorrhage, improved, Massive hemorrhage, persistent hematemesis and melena	Gastric ulcer	Subtotal gastrectomy Excision of ulcer 5/4/46	Recovered	Phlebothrombosis, ligation left superficial femoral vein	None
Sudden massive hemorrhage Persistent bleeding Second massive hemorrhage	Duodenal ulcer	Subtotal gastrectomy Excision of ulcer 7/16/46	Recovered	Partial wound disruption, secondary closure	Ulcer inspected, stopped bleeding.
Massive hemorrhage, stopped Massive hemorrhage, stopped Third massive hemorrhage and persistent bleeding	Subacute diffuse gastritis	Subtotal gastrectomy, Excision areas of hemorrhage 10/4/46	Recovered	None	Focal mucosal and submucosal areas of hemorrhage
Persistent melena— Sudden severe hemorrhage and shock	Gastric ulcer	Subtotal gastrectomy Excision of ulcer 3/19/47	Recovered	None	Vessel in ulcer base
Massive hemorrhage, bleeding subsided Second massive hemorrhage and shock	Gastric ulcer	Subtotal gastrectomy Excision of ulcer 3/28/47	Recovered	Wound infection	Artery in ulcer crater
Severe melena, stopped bleeding Recurrent melena and shock	Severe antral gastritis	Subtotal gastrectomy Excision bleeding area 4/11/47	Recovered	None	None
Massive hemorrhage, Persistent hematemesis, melena and shock	Gastric ulcer	Subtotal gastrectomy Excision of ulcer 5/28/47	Recovered	None	Artery in ulcer base
Sudden severe massive hematemesis, melena, and shock	Gastric ulcer	Subtotal gastrectomy Excision of ulcer 7/3/47	Recovered	None	Massive hemorrhage 8 days after closure of perforated ulcer. Blood clot found in ulcer crater.
Persistent melena— Massive hemorrhage and shock	Gastric ulcer	Subtotal gastrectomy Excision of ulcer 8/7/47	Recovered	None	None
Persistent melena, and mild shock	Duodenal ulcer	Subtotal gastrectomy Exclusion of ulcer 10/10/47	Recovered	None	None
Persistent hematemesis and melena Massive hemorrhage and shock	Gastric ulcer	Subtotal gastrectomy Excision of ulcer 2/10/47	Recovered	None	Negative operative findings, Pathologist—small ulcer with vessel in crater
Persistent massive hematemesis, melena and shock	Duodenal ulcer	Subtotal gastrectomy Exclusion of ulcer 2/13/48	Died on table. Luetic aortitis & heart block, autopsy	—	Posterior wall ulcer inspected, not bleeding. Large amount blood given preoperatively.
Persistent severe melena	Duodenal ulcer	Subtotal gastrectomy Exclusion of ulcer 2/16/48	Recovered	None	None
Persistent moderate hematemesis, melena, and shock	Duodenal ulcer	Subtotal gastrectomy Exclusion of ulcer 4/26/48	Recovered	None	Duodenum opened, ulcer not bleeding
Massive hemorrhage, persistent hematemesis and melena, Second massive hemorrhage and shock	Duodenal ulcer	Subtotal gastrectomy Exclusion of ulcer 5/20/48	Recovered	Hepatitis, homologous serum jaundice following plasma given by local M.D.	Duodenum opened, ulcer not bleeding—healed gastric ulcer.
Persistent melena and shock	Duodenal ulcer	Subtotal gastrectomy Excision of ulcer 6/7/48	Recovered	None	See text—
Persistent hematemesis, melena and shock	Duodenal ulcer	Subtotal gastrectomy Exclusion of ulcer 6/12/48	Died—3rd P.O. day	Atelectasis, peritonitis, shock, no autopsy	Gastrojejunal ulcer healed.
Persistent hematemesis, melena, and shock	Duodenal ulcer	Subtotal gastrectomy Exclusion of ulcer 6/13/48	Recovered	None	Duodenum opened, ulcer not bleeding.
Massive hemorrhage following gastroscopy, suspected gastric neoplasm by x-ray	Severe antral gastritis	Subtotal gastrectomy Excision of ulcerations 2/11/49	Recovered	None	Suspected granulomatous lesion at operation. Path. report: acute suppuration and superficial ulceration.
Massive hemorrhage, Persistent hematemesis and melena	Duodenal ulcer	Subtotal gastrectomy Exclusion of ulcer 2/4/49	Recovered	None	Alcoholic, fatty liver, no portal hypertension.
Massive hemorrhage, ceased bleeding. Second massive hematemesis, melena and shock	Duodenal ulcer	Subtotal gastrectomy Excision of ulcer 2/11/49	Recovered	None	None
Massive hematemesis, persistent melena, and shock	Undetermined	Subtotal gastrectomy 3/10/49	Recovered	Bled postoperatively 24 hours, probably from the anastomosis.	None
Persistent melena, mild hematemesis. Shortage AB rh-blood	Gastric ulcer	Subtotal gastrectomy Excision of ulcer 3/21/49	Recovered	None	Duodenal ulcer present, but not bleeding.

centimeters of blood every eight hours indicated a dangerous rate of bleeding and provided a definite surgical indication.

Hemoglobin, red cell and hematocrit determinations were of value in estimating the state of exsanguination on admission to the hospital and between episodes of severe bleeding. During periods of massive hemorrhage and liberal blood replacement with rapid changes in blood volume, these determinations were less reliable measurements of the degree of hemorrhage, and were often not calculated during periods of severe bleeding.

The age of the patient was considered an important factor, although the selection of the patients for operation was not based on this factor alone, as is shown by the fact that 43.5 per cent of the patients were under 45 years of age. One must remember that the younger patient occasionally dies from massive hemorrhage. Hoerr, Dunphy, and Gray[17] believe the important point concerning older patients is that they are more likely to develop an exsanguinating hemorrhage and need closer observation on this account. If the bleeding is not exsanguinating in character, it is equally important to avoid the risk of unnecessary surgical procedures in the older patient. Therefore, the fact that the patient is past middle life is not an absolute indication for prompt operation but a warning that there is greater danger of an exsanguinating hemorrhage.

The duration of bleeding was a factor of less importance in this series, since 73.9 per cent of the patients were operated upon after Finsterer's forty-eight hour period had passed. The longer interval of bleeding is explicable solely on the striking dissimilarity and wide variations in the degree of hemorrhage in these patients. Some patients bled slowly for days and then had a massive hemorrhage. Others had a massive hemorrhage, stopped bleeding for a few days, and had a second massive hemorrhage. The decision to operate within forty-eight hours is a difficult one to make since the fatal type of hemorrhage cannot always be differentiated from bleeding which will stop with nonoperative measures. Our patients were selected for operation after careful consideration of all the important factors and indications for operative intervention, with emphasis on the individual behavior pattern of each patient.

Subtotal gastrectomy, with removal of about 75 per cent of the stomach including the pylorus, was performed in all of the patients. This procedure was selected as the one most likely to succeed in controlling hemorrhage and curing the patient. The source of bleeding was removed in thirteen cases. Nine duodenal ulcers were treated by exclusion. They were judged to be technically too difficult to remove without dangerously increasing the risk of the operation. It is well known that bleeding stops when the exclusion operation is performed, as it did in all of our cases. Diversion of the gastric secretions from the ulcer will prevent repeated digestion of the blood clot and intermittent hemorrhage. The ulcer, unmolested, eventually heals.

Subtotal gastrectomy for massive hemorrhage is a formidable procedure and should not be attempted by untrained surgeons or performed in hospitals inadequately staffed or equipped to cope with this emergency. Our patients were operated upon by the chief surgeon, consulting surgeon, or the senior surgical resident of the hospital. The patients were quite well prepared for the emergency operation as judged by our present-day standards. The blood loss was corrected by massive transfusions prior to operation and the anesthesia preparation was adequate. In a few patients the intestinal tract, which was usually full of blood, was distended with gas. One patient had a greatly distended transverse colon which interfered with the surgical procedure. The colon was decompressed aseptically and the operation was continued uneventfully.

The favorable mortality rate in our series is due to the excellent anesthesia administered by trained anesthetists, a carefully executed operation, and the employment of the recent advances in postoperative management. The anesthesia used was a mixture of pentothal-curare supplemented with endotracheal nitrous oxide and 50 per cent oxygen as advocated by Baird, Johnson, and Van Bergen.[5] Intragastric siphonage was maintained throughout the operation and, postoperatively, until normal peristalsis returned. A large left subcostal incision was used. The resection was done according to the technique recommended by Wangensteen.[28,29] Bowel continuity was reestablished by an end-to-side gastrojejunostomy, utilizing a short afferent loop, retrocolic, antiperistaltic, Hofmeister-Pólya, 6 centimeter, aseptic anastomosis. Interrupted, fine, nonabsorbable suture material was used throughout, including the closure of the abdominal wound. One gram of streptomycin and one million units of penicillin in solution were injected into the peritoneal cavity. Blood was administered throughout the operation and whenever it was needed postoperatively. Electrolytes, vitamins, protein, streptomycin, and penicillin were given postoperatively. Early ambulation was practiced. A bland diet was usually started on the fourth postoperative day. The patients were weighed each day and maintained in a balanced state of hydration.

In a few cases the aseptic technique was broken, momentarily, when the duodenum was opened to inspect the posterior wall for active bleeding. Of the few patients inspected in this manner, no patient was found to be bleeding actively during the operation. Had such a bleeding point been encountered, transfixion and ligation of the vessel would have been done for immediate control of the hemorrhage. Some of the resected gastric ulcers showed an eroded vessel in the base of the ulcer. Now and then the vessel was occluded by a blood clot or an early thrombus.

During the three-year period of this study, two deaths occurred from massive hemorrhage of ulcer origin on the medical service of this hospital according to Ebert.[12] One death was that of an orderly who refused operation. The second death was in a case of meningiovascular syphilis with cerebral thrombosis. The patient was admitted in coma and died within a few hours.

In the series operated upon, one death was due to luetic aortitis. Heart block occurred during the operation and the patient died on the table. The second patient died of atelectasis, peritonitis, and toxemia three days after the operation. The previous gastroenterostomy in this patient was difficult to take down. The operation was long, arduous, and was not performed aseptically.

A few patients with severe hemorrhage in this series might have recovered without operation. Unquestionably, the two patients with moderate hemorrhage would have recovered without operation. They were young, healthy males, with early moderate hemorrhage. The operation was done not only to check the bleeding but to provide the corrective gastrectomy. In one patient the preoperative diagnosis was probable neoplasm. The source of bleeding later proved to be a chronic antral gastritis with suppurative inflammation and superficial ulceration. Three patients with hemorrhage due to gastritis were cured by subtotal gastrectomy. At least one of these patients was in such a precarious condition that a fatal outcome seemed inevitable without operation.

Whether any of the exsanguinated patients would have lived without surgical intervention is not known. Based on a study of the individual records, the surgical recoveries represent pure salvage, that is, the patients would not have recovered without operation. Furthermore, operation was resorted to after medical treatment had failed. For these reasons, surgical and medical mortality rates are not comparable. One death in fifteen exsanguinated patients, a mortality rate of 6.7 per cent, indicates that our present plan of surgical management has merit, is relatively safe, and should be continued.

Summary and Conclusions

1. The majority of patients with severe gastric and duodenal hemorrhages will recover if treated conservatively by proper medical management. However, approximately 5 to 10 per cent of patients treated conservatively for massive hemorrhage of ulcer origin will have a fatal termination.

2. The incidence of death in bleeding gastric ulcer is higher than in bleeding duodenal ulcer.

3. There appears to be a direct relationship between the duration of the bleeding and the age of the patient to the mortality rate. The increased mortality is noted in patients bleeding longer than forty-eight hours and in patients over forty-five years of age.

4. The more serious massive hemorrhages are arterial in origin and arise usually from the gastroduodenal, pancreaticoduodenal, and the right or left gastric arteries or their major branches.

5. The indications for surgical intervention must be individualized and conservative in order to avoid unnecessary operation. The duration of bleeding and the age factors are important; however, greater emphasis is being placed on the selection of patients for operation according to the rate of bleeding, recurrent hemorrhage, and shock. The failure to maintain a stable circulation with a transfusion of 500 cubic centimeters of blood every eight hours indicates an exsanguinating type of hemorrhage. These are the patients in whom operation is most often employed after the circulation is stabilized by massive transfusions.

6. The operation of choice is a subtotal gastric resection with removal of the ulcer. If it appears impossible to resect the ulcer, subtotal gas-

trectomy with exclusion of the ulcer will control hemorrhage and cure the patient.

7. With the exception of early operation, the mortality rate of emergency surgery in massive gastric and duodenal hemorrhage of ulcer origin has been high. Since the operative procedure is employed after medical management has failed and as a last resort to save life, surgical mortality should not be compared with the mortality of medical management.

8. Twenty-three patients with massive hemorrhage were reported with two deaths, a mortality rate of 8.7 per cent for the entire group. There were fifteen patients with exsanguinating hemorrhages with one death, a mortality rate of 6.7 per cent. The one death in the exsanguinating group was an operative death from peritonitis following a difficult resection in the presence of an old gastroenterostomy. The one death in the group with severe massive hemorrhage was an unavoidable cardiac death from luetic aortitis and heart block that occurred on the operating table. Although this series is small, the mortality rate is low and is due to the recent improvement in anesthesia, surgical technique, and postoperative care.

SOCIALISTIC MEDICINE COSTS BRITAIN MORE THAN SEVEN TIMES COLLECTIONS

Britain's socialistic provision for free medical and dental care for its citizens now costs that country 300 million pounds sterling annually, or about twice the amount originally estimated by the proponents of this paternal plan, Aneurin Bevan, Minister of Health, has admitted.

Minister Bevan explained that one of the reasons why the cost of the health service the first year was so much higher than had been estimated, is the fees paid to physicians were in certain cases raised above the level originally scheduled. However, the chief cause of the high cost of the socialistic scheme was the overwhelming use made of it by the public. Overnight, doctors, dentists, oculists, pharmacists and the hospitals became very popular with the people as health service became "free" and everyone wanted all they could get. In the first year 187 million prescriptions were dispensed free, 5,260,000 requests for eye-glasses were supplied and the year's end found 3,000,000 more on order, dentists took care of 8,500,000 free patients, and 5,071 wigs were supplied to baldheaded folk.—*Insurance Economics Surveys*. February, 1950.

DISSECTING ANEURYSM OF THE AORTA

Report of a Case Diagnosed Two and One-half Years Before Death By Rupture

J. S. BLUMENTHAL, M.D., F.A.C.P.
Minneapolis, Minnesota

THERE ARE few more dramatic episodes in the field of medicine than that produced by a dissecting aneurysm of the aorta. Males are most frequently affected. Baer and Goldburgh[2] report that 65 per cent of their forty-four patients were men, while Schlichter, Amromin and Solway[12] report eleven of fourteen cases as being of the same sex. The age incidence varied greatly, between twenty-six and seventy, with an average of about fifty-three years.

Pain is the most conspicuous feature of the onset of the condition—sharp, shifting, severe. It is usually correlated with the extent and location of the dissection. Collapse and sudden death often with rupture frequently ensues. Occasionally there is no pain. Dyspnea is usually prominent. Agitation, convulsions and other neurological signs may suggest that the central nervous system is involved.[3,9]

Physical findings are extremely varied. Fever and tachycardia usually develop if the patient survives the initial attack. Hypertension may be present but is not nearly as common as frequently asserted, especially in the younger age group. Baer and Goldburgh[2] report that only 58 per cent of their series had a high blood pressure. Schlichter[12] reports that only one in fourteen had a definite history of long-standing hypertension. Four of these fourteen had an elevation of the systolic and diastolic blood pressure only after the onset of dissection; the systolic blood pressure only was elevated in two additional cases and the diastolic blood pressure only in two others. Differences in the pressure in the arms, as in the case presently reported, may be present and very helpful in diagnosis.

Cardiac failure or myocardial infarction are often suggested not only by the history but by the physical and laboratory findings. Cardiac enlargements with decompensation, murmurs, gallop rhythm, faint heart tones, tachycardia, and friction rubs are very frequently present and as frequently confusing.[14] Dilatation and/or deformity of the aortic ring may give the diastolic murmur of aortic regurgitation, and in a patient who had not shown this before, give a very helpful hint to the true condition.[8]

In the patient who survives the initial episode, many confusing symptoms, signs and findings may be presented. Frequent erroneous diagnoses are hypertensive heart disease, coronary sclerosis and cardiac failure.[6] Involvement of the spinal cord may give paralysis.[13] The increasing mental confusion, weakness and even physical findings may point to a cerebrovascular accident.[15] Thoracentesis is frequently done for suspected cardiac, tuberculous or even pneumonic pleural effusion. Gastrointestinal symptoms with nausea, vomiting, abdominal pain and rigidity often suggest an acute surgical abdomen. The point of dissection may simulate a renal syndrome with back-pain and hematuria.[5]

Laboratory findings are of little assistance. The white blood counts vary greatly up to 30,000. Albuminuria, hematuria and casts are common. Roentgenograms of the thorax are a great help in showing the increased aortic shadow but are too often not diagnostic. Fluoroscopy, if possible, is of the greatest assistance in showing the large pulsating aneurysm. The chief value of the electrocardiogram would seem to be in the differentiation from an acute myocardial infarction. This is, however, a false assumption, as the anoxia resulting from the episode results in changes in the tracing, which, as in our case, cannot be differentiated from a true infarction. This may be so even when the coronary vessels are not at all ininvolved. In the series reported by Schlichter,[12] of eight cases in which tracings were taken, one was normal, four showed left heart strain, one showed nonspecific changes, and two showed changes of possible recent infarction. Weiss,[16] Wainwright,[14] and Baer and Goldburgh[2] have reported cases in which dissection extended into the coronary arteries with occlusion and resultant infarction. In other words, the electrocardiogram shows the usual results of interference with the blood supply of the affected area and does not necessarily mean a true thrombosis.

The prognosis in dissecting aneurysm is poor.

While it has been stated[13] that 10 per cent of them will heal, and a case has been reported with a survival of four years,[12] the literature gives a very gloomy picture as to life expectancy in cases with really severe episodes of dissection. Varying surgical procedures[11] have and are being tried with conflicting claims, but as yet no definite conclusions have been reached.

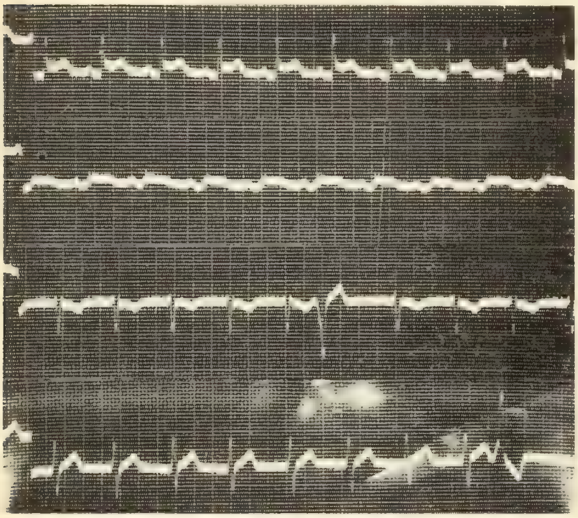

Fig. 1. Elevated ST_1, ST_2, left preponderance, ventricular extra systoles suggestive of an anterior thrombosis.

Healing of this lesion depends, of course, on the extent of the collateral circulation and the extent of dissection. The very separation of the aortic wall from its blood supply is conducive to the extension of the aneurysm.[17]

Since the articles by Gsell[7] and Erdheim,[4] anoxia of the media of the aorta has been implicated as the cause of dissecting aneurysm. The local ischemia may be due, as pointed out by Schlichter,[12] to occlusive disease of the vaso vasorum, alterations of the hemodynamics of the vaso vasorum, severe anemia, congenital abnormalities of the vaso vasorum, or any combination of these factors. The predilection of dissecting aneurysm, and especially those that rupture, for the ascending aorta may be due to the fact that that part of the aorta is much more mobile and gets the greatest strain of the blood stream as it is pumped from the left ventricle. Beyond this, the ascending aorta is not supported and surrounded by connective tissue and other organs which protect and absorb some of the impact. The aorta beyond the ascending also has frequent ostia which may provide more nourishment to the aortic wall directly. Primarily the destruction of the aortic media is the outstanding feature though other factors may play a part. Hypertension[4] may be very important in some cases by causing intimal changes in the small arteries, including the vaso vasorum, with resultant ischemia to portions of the aorta and medionecrosis. Vasoconstriction of nutrient vessels of the aortic wall may be a factor. Once the process is established, even in people with normal blood pressure, transient high blood pressure caused by emotional or physical strain may be enough to cause the dissection, increase the spread, or even rupture the wall.

Case Report

C. P., a white man, aged fifty-three, was first admitted to St. Andrews Hospital on February 22, 1947, with complaints of epigastric pain radiating to the right shoulder. The pain had started on February 20 and increased in severity, in spite of pills given by a doctor, until it had become of great intensity. He was nauseated but did not vomit, and his abdomen had become very hard, and the pain then involved his whole right chest and abdomen. He recalled similar, mild episodes for several years.

On admission, the man was in evident great distress. Pulse was regular at 100. The blood pressure was 130/80 in the left arm but was not obtainable in the right arm—a significant finding, as noted by Dr. Harry Johnson on admission, which gave the first real clue as to the true diagnosis. Heart tones were faint but no murmurs were heard. The abdomen was rigid on the right, but there was tenderness in both lower quadrants of the abdomen, to the extent that on admission a diagnosis of a possible acute surgical abdomen was entertained by the surgeon. There were diminished breath sounds in the left base of the lung. Temperature was 101°; urine showed 1-plus albumin. The hemoglobin was 15.1 gm., and the white blood count was 18,800. Electrocardiogram showed elevated ST_1 and ST_2 (Fig. 1), ventricular extrasystoles and left axis deviation, a typical tracing of anterior infarction.[10] Because of the picture of probable infarction, the patient was started on usual dicoumarol therapy with adequate control of prothrombin times. His condition remained critical with a temperature spiking to 103° until March 20, 1947, when it returned and remained at normal. During this period several urine examinations showed a specific gravity of 1.010 to 1.012 with occasional granular casts and 1 to 2-plus albumin. White cell counts ranged from 8,500 to 21,100. Icterus index ranged from 8.4 to 9.9. Serum bilirubin on February 26, 1947, was direct 10 minutes, 0.7 mg. per cent; direct 30 minutes, 2.05 mg. per cent; and indirect, 1.65 mg. per cent. On March 4, 1947, the serum bilirubin was direct 10 minutes, 0.1 mg. per cent; direct 30 minutes, 1 mg. per cent; and indirect, 1.65 mg. per cent. Stools were normal; blood urea nitrogen ranged to 49 mg. per cent and creatinin to 5.4 mg. per cent. Blood calcium and chlorides were normal. On March 6, 1947, a loud systolic murmur could be heard at the apex. The blood pressure, which had fluctuated, was then 172/78 on the right and 162/108 on the left. Repeated x-ray examinations by Dr. Walter Ude were done, as the clinical picture was quite confusing. The heart showed rather marked enlargement, and the aortic arch was prominent with diffuse dilatation of the aorta (Fig. 2). There was also, on several occasions, an abnormal density at the left base, suggestive of a mild pleural effusion.

The patient gradually improved and was discharged from the hospital fifty-six days after admission. The diagnoses entertained at the start were coronary thrombosis, uremia, cardiac failure, and dissecting aneurysm. The picture gradually cleared so that on March 6, 1947, a definite diagnosis was made of a dissecting aneurysm of the aorta based on laboratory, clinical and x-ray findings.

On October 20, 1949, the patient was readmitted. In the interval his condition had been such that he had resumed with no difficulty his former occupation as guard at the Walker Art Center. On October 18, 1949, he developed pain in the right shoulder strap area which spread to the right lower thorax. He had increasing dyspnea and became nauseated and later vomited. On admission he was pale, apprehensive, but apparently not in shock. Pulse was 150, faint and regular. The right chest showed less movement than the left, dullness, decreased breath sounds—the findings of a pleural effusion. The electrocardiogram showed sinus rhythm, left preponderance, deep Q_3, negative T_3. Blood pressure was 100/60. The liver was down 4 cm. in the right midclavicular line. Crepitant râles were heard in the right chest. Temperature was 103°. White blood count was 27,450, hemoglobin 8.8 gm., red blood cells 3,100,000. Urine showed 2-plus albumin. X-ray now showed a marked pleural effusion on the right. An attempt to aspirate resulted in a small amount of blood. The condition of the patient became progressively and rapidly worse. He complained of pain in the back, vomited, lapsed into a coma and died October 22, 1949.

Autopsy Report (by Dr. Koucky)

Body is that of a white male weighing about 190 pounds. The body shows no jaundice. There is no edema. There are no particular special marks. The peritoneal cavity shows no excess fluid, no blood, and there are no adhesions. The left pleural cavity shows no excess fluid or adhesions. The right pleural cavity is flooded with about 3,000 to 4,000 c.c. of blood, which is principally clotted. The blood has entered the pleural cavity from the junction of the diaphragm and vertebral bodies in the lowermost part of the posterior pleural cavity. The pericardial sac is somewhat discolored by blood infiltrating into it from the diaphragmatic surface. The diaphragm also is infiltrated with blood, and the infiltration extends across the dome and is visible in the attachments of the diaphragm along the anterior costal margin.

The heart weighs about 450 gm. There is very definite hypertrophy of the left ventricle. The muscle shows no evidence of fibrosis or atrophy or softening at any point. The valves show no recent or old endocarditis. The coronaries throughout are large. The walls show a minimal degree of thickening with no atheromata, and there is no evidence of any old or recent occlusion.

Left lung weighs about 350 gm. There is some atelectasis in the base. There is no edema. The right lung is completely atelectatic and is compressed by the clot in the right pleural cavity. The spleen weighs about 150 gm. It shows no infarction and no other gross change. The liver is somewhat rotated around to the right by a mass in the upper posterior retroperitoneal space. It weighs about 1500 gm. and shows no chronic passive congestion or cirrhosis. The gall bladder contains no stones.

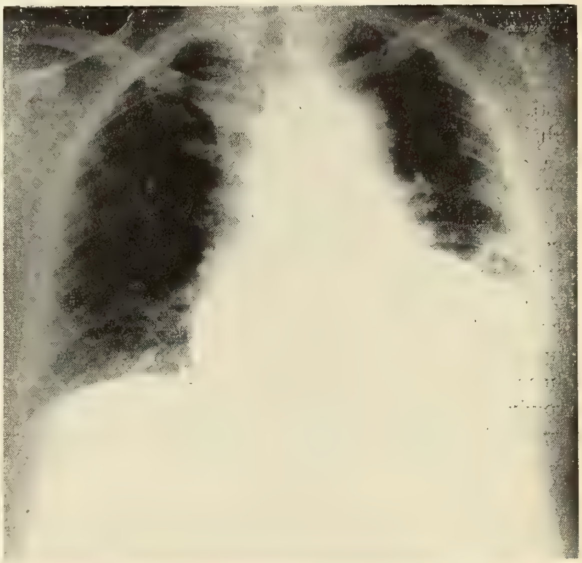

Fig. 2. Generalized enlargement of the aorta. Note duplication of descending aortic wall.

The gastrointestinal tract shows no tumors or ulcers or diverticula or other gross change. The adrenals show no gross change. The pancreas is grossly negative.

The kidneys each weigh about 110 gm. There is extensive atrophy, and the surface of the kidney shows a fine pitting typical of hypertension. There are occasional tiny cysts in each kidney. The ureters are not dilated. The bladder shows no cystitis or trabeculation. The prostate shows occasional small adenomas in each lateral lobe.

The aorta shows a duplication of the lumen beginning immediately below the arch of the aorta. On the convex side of the termination of the arch there is a slit-like orifice which is about 1 by ¾ cm. This opens into the outer chamber of the aorta. There is a prolongation upward along the arch of the aorta as far as the first part of the aorta. This upward prolongation is almost completely closed off by a thrombus. The thrombus is brown and hard and adherent and apparently has been present for a long period of time. The downward dissection of the aorta almost completely encircles the aorta. There is an irregular septum of tissue which generally follows along the anterior part of the aorta which holds the inner and the outer aortic cylinders together. The inner one of the cylinders is quite straight and has a diameter somewhat smaller than the average aorta. The outer cylinder is extremely irregular in outline. There are many irregular vasculations. The lining of the outer cylinder has the smooth and yellowish appearance similar to that of a normal aorta which is involved by arteriosclerosis. The wall of this outer cylinder shows patches of atherosclerosis and areas of calcification. At the level of the diaphragm, the outer cylinder abruptly forms a sacculated mass which measures 7½ by 10 inches. The mass is almost entirely a dilation of the outer cylinder which has become filled with hard adherent thrombus. Following the under surface of the most superior part of this aneurysmal sac there is an irregular channel which passes laterally and to the right and perforates through the wall of the aneurysm. This perforation enters the right crura of the diaphragm and has perforated through the superior surface of the diaphragm into the right pleural cavity. The aneurysmal sac ends about 1 or 1½ inches above the vifurcation of the aorta. This terminal inch is filled with a brown adherent thrombus, and there is more of the thrombus extending along the right ileac artery. There is a small channel on the side of this thrombus in the terminal part of the aorta.

Conclusions

1. Arteriosclerosis
2. Arteriosclerotic dissecting aneurysm of the aorta (old)
3. Recent rupture of arteriosclerotic aneurysm
4. Hematothorax
5. Hypertension
6. Cardiac hypertrophy

The case reported is remarkable in that the patient survived two and a half years after a major, definite episode of dissection. He was able to return to his usual work. It also demonstrates the difficulty in making a diagnosis. The very definite electrocardiogram changes were not of organic origin but rather apparently due to ischemia, as the vessels at autopsy were patent and showed no marked changes. It should be noted that the tracing taken on his last admission showed no marked abnormal changes. While the findings of the electrocardiogram and the whole clinical picture were confusing, in keeping with reports in the literature, the correct diagnosis was made two and a half years before death with the help of x-ray and the fact that the facts did not quite fit the picture of an acute coronary thrombosis in its entirety, especially as to symptomatology and clinical course. It is well to keep this in mind in all cases of atypical cardiac episodes.

HEALTH PROTECTION IN THE HOME

The family is engaged in a variety of activities associated with homemaking, housekeeping, and child care with which we are so familiar that we often fail to realize their significance. If there is to be any effective health care and preventive medicine, as distinguished from treatment of the sick, it cannot be provided by doctors, nurses, or other professionals—however much their knowledge and skills may be needed by the family. Health care and preventive medicine are carried out in the daily activities of housekeeping and homemaking. Through marketing, cooking and the serving of meals, basic nutritional needs must be met, and through housecleaning, laundering, dishwashing, and similar sanitation, the necessary defense against infections and contamination must be maintained. Through provision of rest, care of minor ills, and all the cherishing functions within the home, individual members are protected and restored, so that they can live in health and carry on their daily activities.—Lawrence K. Frank, *The Survey,* December, 1949.

SPONTANEOUS REMISSION IN SUBACUTE LEUKEMIA

Report of Case

JAMES F. HAMMERSTEN, M.D. and CARLETON B. CHAPMAN, M.D.
Minneapolis, Minnesota

THE ACUTE and subacute leukemias are uniformly fatal diseases, the total duration of which may be as short as three weeks. Occasionally, however, patients with the subacute form of the disease may survive as long as eighteen months. No entirely credible report of cure, spontaneous or otherwise, has appeared, but a number of reports of spontaneous remission in the diseases are available. Judging from these accounts, remission may be characterized by symptomatic and hematologic improvement, sometimes to a very remarkable degree. Published descriptions of truly complete remissions, in the sense that the patient becomes asymptomatic, the abnormal physical findings disappear, and the peripheral blood and bone marrow show no evidence of leukemia, are rare. The literature contains only seven cases in which the occurrence of remission was established not only clinically but also by adequate studies of the peripheral blood and bone marrow (Table I). In addition, there have been nine cases with allegedly complete remissions in which no bone marrow studies were done during the period of improvement.[3,4,5,7,12,13,14,19,20] Incomplete remissions in acute leukemia have been frequently reported.[7,10,16,17,21] The incidence and character of such remissions are of utmost importance in view of the fact that chemical agents, thought to produce remissions that are longer than the spontaneous variety, have recently been described.[6,8,9]

The following case of subacute leukemia is presented, not only as an illustration of complete spontaneous remission but also to illustrate the difficulty of assessing the value of therapeutic agents in this type of hematologic disorder.

TABLE I. CASES OF ACUTE LEUKEMIA WITH REMISSION PROVED BY EXAMINATION OF BONE MARROW.

Author	Age	Sex	Type	Duration	Hematologic Remission		Bone Marrow During Remission	Remarks
					Complete	Incomplete		
Birge, Jenks & Davis (2)	33	F	Stem	21 months	+		Normal	
Pellegrini (18)	14	F	Monocytic	5 months		+	Normal	Monocytes in peripheral blood never below 17 per cent.
	52	F	Lymphatic	3 months		+	Nearly normal end of remission.	Per cent of polymorphonuclears never over 57 and hemoglobin never over 75.
	39	F	Monocytic	1 year		+	Normal	Per cent of polymorphonuclears never over 50 and monocytes never below 22.
Moeschlin (17)	23	M	Myelogenous	1st remission 7 months	+		Normal	
				2nd remission 3 months	+		Normal	
				3rd remission 2 months		+	Showed abnormal numbers of myeloblasts	Leukopenia persisted; white blood count never over 4400
	38	M	Myelogenous	6 weeks		+	Normal	Hemoglobin never over 82 per cent and white blood count never over 3000.
Henning (11)	47	M	Myelogenous	3 months	+		Normal	

Report of Case

A twenty-year-old white man was admitted to the hospital on May 17, 1948, complaining of progressive weight loss of six months' duration.

He was perfectly well until January, 1948, when chills and night sweats began. In March, he developed weakness which soon forced him to give up his job as a manual laborer. In April he was told by his physician that he had anemia, and iron therapy was instituted but was without effect. A tooth extraction at this time caused a moderately severe hemorrhage from the tooth socket. In early May, he noted the appearance of numerous, slightly tender masses in the neck, armpits, and groins. Shortly afterwards, his physician found "changes in the white cells" and hospitalization was recommended. A few days before he came to the hospital, members of his family noticed that he was slightly

jaundiced. At the time of admission, he had lost about 35 pounds since the beginning of his illness although his appetite had been excellent.

The past and family histories were irrelevant.

TABLE II. SUMMARY OF HEMATOLOGIC DATA FROM ADMISSION TO THE END OF THE FIRST REMISSION.

Date	Hb. mg.	RBC mill.	WBC Thou.	PMN %	L %	M %	E %	B %	Sed. Rate mm./hr.

10-14-48	9.8		4.1	22	78				

On admission, the temperature was 100.4 degrees, the pulse rate 98, and the blood pressure 118/72 mm. Hg. He was an acutely ill, well-developed young man whose skin and conjunctivae were slightly icteric and who was complaining of pain in the flanks. Other significant finings were malodorous breath, a tender spleen which extended 12 cm. below the left costal margin, tenderness in the right costovertebral angle and in both flanks, small petechial hemorrhages over both ankles, and pronounced generalized lymphadenopathy. The nodes were discrete, firm, and slightly tender, measuring up to 2 cm. in diameter. Tenseness of the anterior abdominal musculature prevented adequate evaluation of the size of the liver.

The hematologic findings on admission are summarized in Table II. In the peripheral blood some of the lymphocytes were young forms but no true blast cells were seen. Bone marrow aspiration showed decreased formation of neutrophils, suppression of erythropoiesis, a pronounced increase in the number of lymphocytes, most of which were immature, and a large number of blast cells which were thought to be lymphoblasts. The bleeding time was one minute and the clotting time four and one-half minutes. The prothrombin cencentration was 58 per cent (control 14.5 seconds, patient 16.9 seconds). A bromsuphthalein test showed 22 per cent retention in forty-five minutes. The one-minute serum bilirubin value was 2.1, and the total 4.1 mg. per 100 c.c. The cephalin-cholestrol flocculation test gave 4 plus results in twenty-four and forty-eight hours. The alkaline phosphatase test showed 43 King-Armstrong units. The blood Kahn test was negative. The initial blood cultures were contaminated but six subsequent ones were negative. Agglutination studies for typhoid, paratyphoid A and B, brucellosis and tularemia were negative as were three heterophil antibody tests, carried out three weeks apart. Urinalysis showed a one plus test for albumin and a few red cells in the spun sediment. An x-ray film of the chest showed no abnormality but a film of the abdomen showed the spleen and liver to be grossly enlarged.

The diagnosis at this time was acute or subacute leukemia. The patient's status appeared to be grave. The temperature chart showed daily elevations to 103 and 104 degrees and he continued to complain of severe, generalized aching. The number of petechiae increased and there was bleeding of the gums. An effort was made to obtain aminopterin for therapeutic use, but before the drug could be obtained, the patient's symptoms began to improve. The leukocyte count began to fall and the fever to subside. Three weeks after admission (June 7) the temperature was normal, the lymphadenopathy and jaundice had disappeared, the spleen had become much smaller, and the patient felt perfectly well. Because of the dramatic improvement the possibility that the initial diagnosis was in error was considered, but a sternal aspiration still showed changes consistent with lymphatic leukemia, although the percentage of blast forms was lower than at the time of admission. Since the leukocyte count fell to leukopenic levels, penicillin therapy was begun but was discontinued after seventeen days because of continued general improvement and changes in the total and differential leukocyte counts toward normal. On June 29, the serum bilirubin, alkaline phosphatase, and bromsulphthalein values were normal but the cephalin-cholesterol flocculation test continued to show 4 plus values in twenty-four and forty-eight hours. On July 13, about two months after entry, the patient was apparently perfectly well. The temperature was normal, he had no complaints, and the physical findings were those of a healthy young man except for a barely palpable spleen. The hemogram was almost normal and the sedimentation rate had fallen to 35 mm. in one hour. The appearance of the bone marrow was normal except for a slight increase in the number of adult lymphocytes. On this date, a severe chill and an elevation in temperature to 103 degrees interrupted the remission but the fever and accompanying symptoms subsided within a few days. During the latter part of July and all of August and September, the patient was perfectly well and spent most of the time at home. On August 31, the bone marrow was completely normal in appearance. The lymphadenopathy, splenomegaly and hepatomegaly had disappeared.

In early October, malaise, weakness, and fever returned, as did the lymphadenopathy, icterus, and spleno- and hepatomegaly. The total leukocyte count was normal but there was a pronounced relative lymphocytosis. The bone marrow was dominated by immature lymphocytes of which 25 to 30 per cent were blast cells. The erythrocyte sedimentation rate was again markedly elevated. Liver function studies gave reults that were very similar to those obtained on admission. Late in October there was a partial remission but the abnormal findings did not disappear altogether. Treatment consisted of occasional blood transfusions and in November, because of an increase in the total leukocyte count to between 50,000 and 100,000, small doses of x-ray therapy were given to the spleen (100 RU total). The leukocyte count dropped rapidly and reached the very low level of 900 per cu. mm. about a month after the treatment was given. Shortly after termination of the treatment there was a marked exacerbation of symptoms and from this time on, the course was one of steady deterioration. Blood transfusions and treatment with antibiotics were continued, without significant effect. During the first half of December, the total leukocyte count varied between 750 and 3,000, of which from 84 to 98 per cent were lymphocytes. Occasional blast cells were seen in the peripheral blood. From this time to the end of February the total count ranged between 1,000 and 6,000 and there was marked improvement in the differential count, which at times reverted completely to normal. During the last month of the patient's course, the total count remained below 3,000 the percentage of lymphocytes steadily increased, and the hemoglobin declined. He finally succumbed on March 22, about fifteen months after the onset of his disease and seven months after admission to the hospital. At the time of death, the total leukocyte count was 2,000, of which 36 per cent were neutrophils and 64 per cent lymphocytes. The hemoglobin was 7.6 grams per 100 c.c. of blood.

Permission for autopsy was refused.

Comment

The case presented is remarkable because of complete spontaneous remission in a disease the course of which is ordinarily characterized by inexorable progression. The remission may fairly be said to have begun in mid-July and to have ended early in October, a period of about ten weeks. During much of this time the only abnormal finding was a moderately elevated erythrocyte sedimentation rate, although during the latter half of the period, the differential leukocyte count showed signs of reverting to a state similar to that found on admission. The bone marrow, five weeks after the remission began, was perfectly normal. The remarkable remission in symptoms and abnormal physical findings was not altered until the end of the period. Even late in the course of the disease there were symptom-free periods, lasting as long as a week, but the hematologic and bone marrow findings never again returned entirely to normal.

The average incidence, degree and duration of spontaneous remission in acute leukemia are not known with certainty. The cases available in the literature (Table I) provide no information with regard to incidence of spontaneous remissions, although one authority, quoted by Farber,[9] is said to have observed them in 10 per cent of 300 cases of acute leukemia in children. The average duration of the remissions in this group was about ten weeks. Had it proved possible to treat the patient, whose case report is presented, with one of the folic acid antagonists, such as aminopterin, or amino-an-fol, the presumption of a cause-and-effect relation between the drug and the remission would have been difficult to avoid.

The extreme difficulty of evaluating a therapeutic agent that does not produce outright cure in acute or subacute leukemia is made apparent by cases such as the one presented. Farber[9] reported recently that over 50 per cent of approximately sixty children with acute leukemia ". . . showed improvement clinically, hematologically of important degree attributable to the action of these compounds." The basis for this judgment and details of the cases are not given, the author contenting himself with the statement that the remissions he observed were due neither to acute infection nor to massive blood transfusion, a procedure which, according to Bessis,[1] is followed by a high incidence of remission. Dameshek,[6] reporting on the effect of treatment with aminopterin in thirty-four cases of acute and subacute leukemia, observed a remission rate of 26 per cent which was thought by him to be higher than the incidence of spontaneous remission. Meyer and co-workers[15] observed beneficial results in only four of forty-three leukemic patients who were treated with aminopterin. Fifteen of their patients showed grave toxic manifestations which could not be controlled either by varying the dose of the drug or by giving liver extract along with it.

The therapeutic value of aminopterin and related compounds, therefore, remains very uncertain. At the present time, it seems wisest to utilize transfusion of whole blood, antibiotics, and symptomatic measures when indicated. Spontaneous remission may provide the patient with welcome relief from symptoms as it did in the case presented, but the attempt to obtain the same result by the use of folic acid antagonists seems premature.

The jaundice and other evidence of hepatic dysfunction are of some interest since they are said to occur rather seldom in patients with leukemia. The possibility that the hematologic disorder was complicated by hepatitis, either homologous serum or epidemic, cannot be ruled out since no autopsy was done.

Summary

A case of subacute lymphatic leukemia with complete spontaneous remission lasting about ten weeks is presented. During the remission the patient's symptoms and abnormal physical findings disappeared. The peripheral blood and bone marrow became normal in all respects. The spontaneous improvement was comparable to remissions that have recently been attributed to the use of folic acid antagonists, the clinical status of which is briefly discussed.

Addendum

Five additional cases of remission in acute leukemia, substantiated by bone marrow biopsy, are cited in the following work, which was not available until after the preceding report was prepared: Leitner, S. J.: Bone Marrow Biopsy. New York: Grune and Stratton, 1949.

MINNESOTA'S SHARE OF PROPOSED FEDERAL BUDGET $789,365,400

If Congress should adopt in full the 42.4-billion dollar budget proposed by President Truman for the fiscal year ending June 30, 1951, Minnesota taxpayers will be required to pay out approximately $789,365,400 in Federal taxes as their share of the cost of this spending program.

The Minnesota Taxpayers Association has pointed out that the $789,365,400 share which would be borne by Minnesota taxpayers to support the President's proposed budget, which does not include social security program, is over five times the $153,617,000 in taxes collected by Minnesota last year to finance the entire State Government.

According to the Association: "These social welfare programs already exact millions of dollars annually from Minnesota wage and salary earners in the form of taxes deducted from their pay checks. If Congress should approve the new proposals, these taxes will rise sharply when the new programs get in full operation."

The Association continued: "A substantially smaller budget of $36-billion was proposed just four weeks ago by Senator Harry F. Byrd of Virginia. Under Senator Byrd's program the Federal budget could be balanced in 1951 with some funds left over to cut the staggering public debt. The difference between the two proposed budgets is 6.4 billions. The saving to Minnesota would be $119,040,000. This would go a long way towards payment of the entire cost of our State Government. It is more than enough, in fact, to pay for the entire Veterans' bonus.

"The Federal budget can be balanced in 1951. It can be balanced without increasing Federal taxes. It should be balanced by reducing non-essential expenditures just as we have had to do it on the farm, in business and in industry, and as every housewife in Minnesota has had to do in these days of high taxes and high prices. Deficit-financing should be stopped."—From *Minnesota Taxpayers Association.*

HEALTH IS A COMMUNITY PROBLEM

DAVID A. SHER, M.D.
Virginia, Minnesota

FACTORS which contribute to health are varied and numerous. The doctor, the nurse, the hospital, the public health official and allied personnel all make their contributions to the cause of individual and community health, and co-operation is essential. Health and illness are problems too complex to be solved by any one of these human elements or organizations.

It is obvious that proper physical and mental health cannot be expected unless there are good housing, proper clothing, satisfactory food and happy family life. The doctor may be unaware of a deficiency in any of the above mentioned essentials for proper physical and mental health, while the nurse in the hospital, through her contacts with visiting parents and relatives, may obtain hints as to the need for further investigation.

This information passed on to the doctor and/or public health nurse may be invaluable in continuing the patient's care at home. In this way the public health nurse can plan her course of action more intelligently when she comes into the home. The doctor, too, can thus outline a more successful course of therapy in the home. If some of the essentials toward proper physical and mental health are missing, perhaps the public health nurse may be able to arrange for their restoration. So often, the doctor will leave proper instructions, assuming that they will be carried out. But without some sort of a check, he has no way of knowing whether or not his orders are fulfilled in their entirety—either because of ignorance or because of lack of the essentials conducive to proper health and recovery.

No field of specialized medicine has a broader scope, greater responsibilities or greater possibilities than has pediatrics.

To some the practice of pediatrics is essentially infant feeding; to others it is the management of the ills of the first two or three years of life; to still others it is preventive medicine; and to a few it is simply the management of behavior disorders. It is all these and more. Concern for the child must antedate conception and extend through the period of adolescence. Care of the unborn child is provided by adequate care of the pregnant woman, and obstetric care at the time of delivery is reflected in the care of the infant. The neonatal period, or the first four weeks of life, is the single most important period of life and presents problems that never exist again. Infancy, or the first two years of life, represents the period of most rapid growth. This is the time when the infant is completely dependent on others for all phases of his care—when he is not only more susceptible to infections and nutritional disturbance but often has a pattern of response which differs from that of later years. As the age of infancy is passed and the preschool, prepuberty and adolescent ages are attained, the child assumes increasing responsibility in his own care, but intelligent and understanding pediatric supervision continues to be an important aid. I mention the above to call attention to the fact that in pediatrics we are always dealing with a growing individual—his physical and mental constitution is constantly going through changes. One must be aware of these metamorphoses in order to deal with any deviations from the normal.

Surveys of children in all economic strata reveal a high incidence of physical and nutritional disturbances and psychological difficulties which are remediable. Obviously in this small space I could not possibly attempt to cover all of these physical disturbances and psychological difficulties. I will try to briefly touch upon two phases which are so often neglected: convalescent care and psychological care of the sick child.

Convalescent Care

Convalescent care as a phase of medical responsibility in the management of the sick child has received only scant attention. There is a great need for a better understanding of both the qualitative and quantitative aspects of such phases of treatment as diet, rest, and activity, and for more adequate measures to determine when convalescence is complete.

In a broad sense, any child who is below par physically is in need of convalescent care. In the more practical sense, the term "convalescent care" should be reserved for the management of the more serious deviations from the states of health which exist as the result of acute or chronic in-

---

Read at the Public Health and Hospital Nurses Conference, Virginia, Minnesota, September 23, 1949.

fections or non-infectious illness but which are not permanent and for which at least some degree of improvement can be expected. The extent to which convalescent care is needed is determined by the pre-existing state of health and by the seriousness and duration of the active state of the illness.

Convalescence from short term acute illnesses in previously healthy children should be completed in a very short time. In such instances gradual increase in activity and special attention to diet are all that is needed. When the illness has been prolonged or unusually severe, greater attention is necessary.

The principal factors are:

1. Rest.
2. Increasing but graded physical activity.
3. Diets which take into account increased need for such essential items as protein, vitamins and minerals.
4. Play and occupational therapy.
5. Provision for formal schooling.
6. An environment which stimulates self-confidence in the child and at the same time provides an adequate sense of security.

The public health nurse, through the co-operation of the hospital nurse, can do a great deal in educating the parent in the above factors.

Children with nutritional deficiencies require special attention. If undernutrition is due to economic factors, every effort should be made to see that ample food supplies are made available. When undernutrition has been due to poor eating habits, which so often are the result of poor training and disturbed parent-child relationships, reconstructive work must be carried out with the parents while the child is still convalescing in the hospital. Supervision and guidance should be maintained after the child is dismissed to his own home, through the co-operation of the public health nurse or social worker.

When the convalescent period is spent in an institution rather than in the child's own home, the parents should be acquainted with the purpose and the methods employed. This should be supplemented by home visits from public health nurses and medical social workers. The nurse visiting in the home can be of great assistance in interpreting instructions for the parents and child and in appraising the home situation for the doctor.

The responsibility for supervision of long convalescent periods within the child's own home will fall upon the physician. If he assumes this responsibility, he must recognize that it is the whole child and not the physical ravages of the disease alone which must be provided for. He will do well to enlist the aid of persons who can provide play and occupational therapy and schooling within limits which stimulate but do not overtax the child. In some instances, the mother may be adequate for this task; in others, dependence will have to be placed upon such persons as visiting teachers and public health nurses. Communities which do not have convalescent institutions could with advantage organize such home care service for convalescent patients.

Psychological Care of the Sick Child in the Hospital

Tens of thousands of children are admitted every year to pediatric hospitals throughout the country. They come at different ages, with different ailments of varying degrees of severity and discomfort. Some never leave the hospital alive; the great majority return to their homes after a short period of residence; others must spend many months or even years in wards of private hospital rooms. They come from the homes of luxury, moderate conveniences, or poverty; from atmospheres of sheltered security, or family disruption; from reasonable parental management, pampering over-solicitude, or inadequate distribution of affection. For many children hospitalization is an unwelcome removal from a happy home, school or play life; for some it is a much enjoyed first opportunity to find kindness, comfort, and an interesting escape from domestic monotony or disagreeable school situations. Unless there is at the time of admission a clouding of consciousness or the suffering is too acute or intense, every child beyond the age of infancy must have the realization that an event of the first magnitude is taking place in his experience. He often brings with him peculiar notions about the meaning and functions of physicians, nurses and hospitals. He may come with confidence or dread, with placid submission or violent protest.

Hospital admissions are often carried out with a gracefulness and charm which cause the child to accept the inevitable as a special privilege. Yet there are situations in which an impatient nurse contributes a great deal toward a few days or weeks of mutual irritation and veritable warfare. A youngster may be snatched away with force and carried to a bed where he is left unheeded, or bewail screamingly what to him seems a major injustice. Or his mother is allowed to lie to him that he will be returned to her and taken back home in a few minutes: he waits and waits until the truth fills him with bitterness and justified resentment. Thus an unpleasant first impression may well play havoc with the patient's adjustments and co-operation.

In spite of the absence from home, in spite of the imposed restrictions of activity, in spite of drugs, injections and enemas, many children look back with pleasant remembrances to the days of their hospitalization.

So many a physician has said to himself that he could help many of his parentally mismanaged patients if only he could get them away from home. Justified fear of losing his patients deters him from making any such recommendations. Illness, necessitating admission to a hospital, comes as an answer to his prayers. The spoiled, overprotected child is away from his agitated mother, and there is a chance to re-educate the child who has temper tantrums, indulgence in food capriciousness with or without vomiting, who is the object of parental bowel overconcern that works with laxatives, suppositories and enemas, has innumerable aches and pains, is afraid of the dark, and gets everything he wants. Successful management of these problems in the hospital can be made to serve as a forceful demonstration to the parents of adequate methods of training. But there must be people on the staff who have learned how to deal with such children and their parents, and of course the public health nurse can see that the hospital management of the problem is continued in the home—or a return to the original difficulty will be the result.

When a child comes to a hospital, he is not just the incidental carrier of a disease that is to be cured. He is not simply a case of pneumonia, rheumatic fever, asthma, or sore throat. He is an impressionable human being, and a member of a family who are very much interested not only in his blood sugar and leukocyte count but very profoundly and essentially in the human being that he is. Professional help receive excellent instruction in the treatment of diseases and care of bodies, in good hospitals. If some time and thought could be given to teaching nurses how to deal with the children themselves, our hospitals, in addition to their great contributions to the physical welfare of children, would render considerable service to the preservation and promotion of the mental health of the patients entrusted to their care.

MORTALITY RATES

The death rate for the United States in 1948 was the lowest in the history of the country, John L. Thurston, Acting Federal Security Administrator, has announced. The announcement was based on a compilation just completed by the Public Health Service's National Office of Vital Statistics.

The crude death rate for 1948 was 9.9 per 1,000 population—2 per cent below the rate of 10.1 for 1947 and 1 per cent lower than the 1946 rate, the previous record low, the report showed.

The leading causes of death remained the same as in 1947. The major chronic diseases associated with advanced age accounted for 63 of every 100 deaths. Death rates in this group showed only slight changes from the 1947 record. The death rate for diseases of the heart was 322.7 per 100,000 population, while the 1947 rate was 321.2. The death rate for cancer and other malignant tumors increased from 132.4 in 1947 to 134.9 in 1948. The death rate for diabetes remained about the same for the two years; the 1947 rate was 26.2, and the 1948 rate 26.4. Deaths from nephritis, and from intracranial lesions of vascular origin each showed small declines. The 1948 death rate for intracranial lesions was 89.7, while the 1947 rate was 91.4. The nephritis death rate dropped from 56.0 in 1947 to 53.0 in 1948.

Mortality from the major infectious diseases continued their long-time declines. The death rate for pneumonia and influenza, combined, and the rate for tuberculosis both reached new lows. A 10 per cent decline from the 1947 rate brought the death rate for tuberculosis (all forms) for 1948 down to 30.0 per 100,000 population and the rate for pneumonia and influenza down to 38.7.

Motor-vehicle accident deaths decreased for the second successive year. The rate for 1948 for this cause was 22.1 per 100,000 population, while the 1947 rate was 22.8. The death rate for accidents other than motor-vehicle accidents also decreased from the 1947 rate of 46.6 to 45.0 in 1948.

Mortality from two of the communicable diseases of childhood increased sharply from 1947, a low year. The number of deaths from poliomyelitis and acute polioencephalitis increased from 580 deaths in 1947 to 1,895 deaths in 1948, bringing the death rate back up to the 1946 level of 1.3 deaths per 100,000 population. Deaths from measles rose from 472 in 1947 to 888 in 1948, which was still well under the figure of 1,310 recorded for 1946. Deaths from whooping cough fell from 1,954 in 1947 to 1,146 deaths in 1948, continuing a long-term decline. Diphtheria deaths also continued their decline, reversed temporarily in 1945; 634 deaths were reported from this cause in 1948.

CLINICAL-PATHOLOGICAL CONFERENCE

DIAGNOSTIC CASE STUDY

ARTHUR H. WELLS, M.D., GORDON C. MacRAE, M.D., and HAROLD H. JOFFE, M.D.
Duluth, Minnesota

Dr. A. H. Wells: Possibly the most common and most difficult diagnostic problems in hospital experiences are those cases with fever of unknown origin. We wish to present an interesting and unusual diagnostic problem of this general nature. Dr. J. D. Fickel will present the history, and Dr. F. W. Conley will give his differential diagnosis; neither knows the postmortem findings.

Clinical Study

Dr. J. D. Fickel: This sixty-five-year-old white male (Case 4439) was admitted to this hospital complaining of weakness and loss of appetite and weight for about one month. The patient dated his present illness to mid-February, when upon arising one morning he fell to the floor on his knees. Following this fall he noticed his knees became painful and slightly swollen. Since that time he had noted generalized weakness especially of both legs, severe loss of appetite and an inability to swallow. The latter was not exactly dysphagia; however, he said he could not choke food down. He had no chills and had noted no fever.

The past history revealed a series of accidents. In 1927 he was in an accident at a coal dock which resulted in fractures of the left elbow, right hip and ribs on the left side. From this he had residual shortening of the right leg and fixation of the left elbow. In 1937, twelve years before admission, he fractured his occiptal skull on a snow plow. Eight years ago a conveyor belt injury of the right hand resulted in amputation of the thumb and three fingers of the same hand. On that admission he gave a history of having a chronic cough which he attributed to coal dust. At that time he weighed 150 pounds. His cough cleared without establishing the etiology. Since then he has been well until the present illness. Social and family history were not contributory.

On admission the blood pressure was 150/60, the pulse 88, respiration 22 and the temperature 101° F. Physical examination revealed a somewhat emaciated white man of approximately 115 pounds in weight in no acute distress. He had an emaciated sallow face. There was a questionable icteric tinge to the sclera. The lungs were found to be clear. The heart tones were strong and free from murmurs. The abdomen was soft and not distended or tender. The liver edge was palpable about 3 cm. below the right costal margin. External hemorrhoids were noted. A grade I benign hypertrophy of the prostate was also palpated. The testes were slightly enlarged and soft and the left one was tender. There was no edema of the extremities. Both knees were a little fusiform in appearance. They were, however, not reddened or inflammed and there was no demonstrable excessive fluid present. They were not especially tender. The left elbow was severely limited in mobility due to an old injury. Absence of the thumb and the first three fingers of the right hand were noted from a previous accident. He had slightly enlarged inguinal, axillary, epitrochlear and cervical lmyphnodes. A consultant found moist râles at the bases of both lung fields; otherwise his examination was essentially as above. The laboratory findings on admission revealed a normal urine; white blood cell counts ranged from 5,000 to 11,000 with normal differential counts. The red blood cell count on admission was 3.4 million and the hemoglobin 7.5 gms. The red blood cell sedimentation rate was increased to 119 mm. per hour (Westergren). Subsequent sedimentation rates were in this range or higher. On the tenth hospital day, for example, the sedimentation rate was 130 mm. per hour. The serum albumin was 4.3 gm. and globulin 1.8 gm. per 100 c.c. Repeated blood cultures were found to be sterile.

Biopsies of an inguinal node was described as histologically normal. An axillary node showed follicular hyperplasia. Bone marrow aspirations from the sternum and from the iliac crest showed 5 per cent plasma cells, otherwise there was a normal distribution of marrow cellular elements. X-ray studies of the knee revealed minimal degenerative changes involving the knee joint on the right side. Chest and skull roentgen pictures were normal.

Because of cold agglutinins it was impossible to cross-match his blood for transfusions. His serum agglutinated his own red blood cells. During the seventy-seven days in the hospital he ran a low-grade fever, never exceeding 101° F. Several tests for Bence-Jones protein in the urine were negative except on one instance there was a question of a positive test. Until just before his death blood cultures were negative. Six days prior to death a culture was found to be positive for staphylococcus aureus. The Felix reaction was negative. The patient's course in the hospital was that of progressive loss of strength, progressive anemia, listlessness and depression. At one time about a month after admission he grew quite disturbed mentally, was violent, upset and hard to keep in bed. Shortly after this he apparently had a remission during which he

---

From the Department of Pathology and Graduate Educational Service, St. Luke's Hospital, Duluth, Minnesota.

became very much improved, was up and about and appeared to be recovering. However, the anemia progressed down to 8 gm. of hemoglobin with 2.9 million red blood cells. He ran a terminal temperature of 107° F., and on the seventy-seventh hospital day he expired.

A definite clinical diagnosis was never established. Considered were multiple myeloma, acute rheumatic fever and rheumatoid arthritis. Two consultants were in on the case, and each of these diagnoses resulted from one of their visits. The terminal episode was that of bacteremia and final death.

Differential Diagnosis

Dr. F. W. Conley: This patient was a sixty-four-year-old man with anemia, weakness, weight loss and joint manifestations. The first three findings are nonspecific; and therefore, I would like to discuss primarily the joint involvement. Our patient's first symptoms included swelling and pain in both knees; however, he also had pain in both ankles, later in both wrists, also in the back and shoulder. The differential diagnosis of polyarthritis includes the following:

I. Rheumatic fever
II. Gonorrheal arthritis
III. Suppurative arthritis
IV. Gout
V. Palindromic
VI. Rheumatoid
VII. Brucellosis
VIII. Symptomatic diseases
  (a) septicemia
  (b) collagen diseases
  (c) carcinoma
  (d) multiple myeloma
  (e) chronic ulcerative colitis
  (f) blood dyscrasias
  (g) malnutrition
  (h) erythema nodosum
  (i) pulmonary disease

Briefly, I would like to review the above list of diseases as they pertain to this case. Rheumatic fever is an acute migratory polyarthritis, while about 10 per cent of the cases of rheumatoid arthritis begin acutely. I feel that in this case both can be excluded. Gout usually starts as a monarticular lesion and as time progresses may involve several joints. Gonorrheal arthritis begins as a polyarthritis and within one to three weeks becomes monarticular. However, in the case under discussion no symptoms of a genital lesion could be found and smears were negative. Brucellosis is usually an arthralgia rather than a true synovial reaction, and also the negative agglutination tests aid in excluding this. The systemic diseases which cause arthritis are the larger and more important group, and it is here we will concentrate our attention. Septicemia can be excluded because of the large number of negative blood cultures. The positive culture in the last week of life was possibly a terminal bacteremia. We can also exclude chronic ulcerative colitis. Blood dyscrasias are something to be considered seriously. An arthritis due to malignancy is most often associated with bronchogenic carcinoma and second in frequency with primary carcinoma in the pancreas. Other common sources are cancer of the gall bladder and kidney. Of course other malignancies can cause joint manifestations, and of these multiple myeloma stands out. He had a severe anemia and a very rapid red blood cell sedimentation rate of 120 mm. per hour. Bone marrow biopsy disclosed 5 per cent plasma cells, and the one finding of Bence-Jones proteinuria is to be noted. All these features strongly favor the diagnosis of mutiple myeloma, yet the negative x-rays of the bones and the very low plasma cell percentage made me hesitate to make this diagnosis.

There are many findings present in periarteritis nodosa and the other disseminated collagen diseases which are missing in this patient. The pains were not "neuritic" in type. There was no albuminuria, hematuria, hypertension, skin lesions, eosinophilia or serous reactions. There was a leukocytosis present in only two white blood cell counts. Leukemia and Hodgkin's disease should be considered. As far as I am acquainted, Hodgkin's disease usually does not cause any joint manifestations of the type we have in this patient. On the other hand, leukemias are one of the common causes of joint pains. The differential counts and bone marrow studies showed no immaturity or suggestion of leukemia.

In conclusion, hidden malignancy in this sixty-four-year-old man cannot be completely excluded. Multiple myeloma remains a possibility. If I am held to one diagnosis, I would choose a low-grade inflammatory disease such as a suppurative polyarthritis with a minimum of joint reaction and occasional episodes of bacteremia as evidenced by the abscesses in the scalp nodules biopsied and the late positive blood culture for staphylococcus aureus. It is possible that the patient's confinement to bed due to the systemic reaction kept him from traumatizing his joints and thus minimized the joint reactions. An aspiration of a knee joint might confirm the diagnosis.

Necropsy

Dr. A. H. Wells: Dr. Conley's diagnosis is correct. The postmortem examination revealed thick greenish gray purulent exudate containing hemolytic staphylococcus aureus in every joint entered, including both knees, shoulders, the right ankle, left elbow and the sternoclavicular joints. The only apparent primary site for the inflammation was the joint cavities themselves. The other organs simply reveal toxic changes. A postmortem blood culture contained a variety of organisms.

Discussion

Dr. A. H. Wells: Concerning the etiology of 140 cases of suppurative arthritis in which cultures were taken, Heberling[1] found the following distributions: staphylococcus aureus, fifty cases; hemolytic streptococcus, thirty-seven; negative joint culture, nineteen; gonococcus, fourteen; staphylococcus albus, ten; streptococcus viridans, eight, and pneumococcus, two cases. Among the less frequent organisms one should also list Brucellae, Eberthella typhosa, Escherichia coli, Bacterium dysenteriae, Leishmania donovani, lymphogranuloma venerium and certain fungi. In most reports well over half of the cases of suppurative arthritis are caused by the staphylococcus and hemolytic streptococcus.

The pathogenesis must frequently be theorized. Synovial tissue becomes infected by hematogenous dissemination from a remote focus in many instances. In others, there is undoubtedly a direct invasion of the joint from a suppurative process in the adjacent bone such as osteomyelitis or epiphysitis. Penetrating wounds may directly introduce the infection into the cavity.

The anatomic incidence of suppurative arthritis in 201 patients[1] was as follows: knee, seventy-two; hips, sixty-five; ankles, seventeen; wrists, ten; elbow, eight; shoulders, seven; small joints, four, and multiple joints, eighteen. The ages of these patients revealed one-fourth of them occurring in the first ten years of life and another fourth in the second ten years, whereas only one-eighth occurred after forty years of age.

The gross and microscopic pathologic changes in acute arthritis are similar to the acute inflammatory reactions found in other tissues except for the complicating features of digestion of articular cartilage resulting in ulceration and irrepairable destruction. This is directly proportional to the severity and duration of the infection. The more severe the cartilage damage the more likely ankylosis will result. Abscesses may form in the marrow of subchondral bone or in the soft tissues throughout the joint.

The usual swelling, pain, heat, tenderness and congestion about a joint leaves little question as to the inflammatory nature of the condition; however, the co-existing systemic disease of which the arthritis is a complication may be so severe as to completely overshadow the joint infection.

In contrast to our patient there is nearly always a neutrocytosis of 15,000 or more with a rapid red blood cell sedimentation rate. Occasionally a positive blood culture is found. The diagnosis generally can be established by a study of the definitely purulent synovial fluid with its many pus cells and bacteria. This demonstration by smear or culture clinches the diagnosis. However, if no bacteria are present, one must rule out acute gout with associated hyperuricema. Dr. Conley has given a differential diagnosis for our case study. The entire gamut in the classification of arthritic conditions may have to be reviewed as possibilities in certain cases[2,3] The articular picture may be masked by the systemic reaction to suppuration as it was in our patient.

Early diagnosis and treatment is stressed by all authorities since irreparable damage can result within two weeks of the onset. Chemotherapeutic and antibiotic therapy, specific for the organism involved given in proper dosage until aspirated joint fluid is sterile and clear, is the generally accepted procedure. Some authors feel that the drugs should also be used in the joint. Willems method[4] of incision and drainage of the suppurative joint followed by immediate active mobilization is highly recommended in the large series of Heberling.[1] This includes an incision of the inflammed joint under general anesthesia and suturing of the appropriate sized rubber drain to the capsule but not inside of the joint. Active motion to full range of motion is repeated every three hours thereafter, even though the joint is put in a plaster cast or in traction. Therapy started in the first week of the infection will have decidedly better results than that started during the second week. If therapy is begun after the third week some permanent injury to the joint generally results.[3]

STREPTOMYCIN IN TREATMENT OF PROGRESSIVE PRIMARY TUBERCULOUS LESIONS

The results of streptomycin treatment in progressive primary tuberculosis may be summarized as follows:

1. It uniformly lessened and in most cases obliterated the toxic manifestations in twenty-five patients treated. The improvement usually became apparent within a few days after the treatment was begun.

2. It reversed the general downward clinical course of the disease.

3. The physical findings improved and were clearly demonstrable in thirty to sixty days after treatment was begun.

4. The decreased roentgenologic findings followed the improvement in the clinical picture.

5. Sputum conversion was completed in four to five months in 89 per cent of progressive primary lesions.

6. The hospital stay was uniformly reduced roughly from two to three weeks to six to eight months' time.

In spite of the fact, however, that streptomycin has shown great promise especially in progressive primary tuberculosis in children, it should not be considered a cure-all; its use is still in the experimental stage and larger numbers will have to be observed over a longer period of time before an exact and complete evaluation of its worth in this field can be given.—McEnery, Sweany, Turner, Chicago, *Illinois Medical Journal,* January, 1950.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY

Rochester, Minnesota

(Continued from the February issue)

From the late nineties Dr. Allen's inventive and mechanical genius became manifest, especially in his Model Invalid Elevator, which he designed to spare the bedridden invalid the strain of assuming different positions for treatment and dressings and the effort of transfer from bed to chair or from room to room. The machine has been described by a physician of Rochester as light but strong and stable. The basic table-like structure ran on small wheels; from it rose a strong metal arm, curved at the top, from which was suspended a horizontal, adjustable sheet of thin metal adequate to support an adult person. The elevation and angle of this metal sheet were controlled by a crank. When the apparatus was wheeled to the bedside, the support could be slipped under the patient, who could then be lifted and transported. Arrangements were made for the manufacture and sale of the elevator, and for some years it was used in hospitals to a considerable extent. It was patented in the United States, Canada, Great Britain, Germany, France and Belgium; in 1899 Dr. Allen was awarded the gold medal of the Academy of Inventors of Paris and was made an honorary member of the society.

Reminiscences of townspeople and gleanings from histories and newspapers of Rochester have thrown light on Dr. Allen's domestic and social, professional and civic life over his many decades in Rochester. A tall, slender, bearded man, he was kindly, gentle and reliable, a good citizen, loyal to his ideals and faithful to his responsibilities. Energetic and industrious, he always asserted that four hours of sleep in twenty-four were enough for any man, especially one engaged in business or professional work. For many years he was a familiar sight, driving on his rounds in town and country in a top buggy drawn by a gentle horse, Kittie; in January, 1912, there appeared a little news item that brought the modest rig sympathetically to the minds of many Olmsted County citizens: the faithful Kittie had died at the age of thirty-two years. In later times Dr. Allen used an automobile, which he himself drove well into his ninety-ninth year. He was a member of the Universalist Church and of fraternal organizations, among them the Masons (he was a member of Lodge No. 21, A. F. and A. M., of Rochester, a Knight Templar, and holder of the Thirty-second Degree), the Independent Order of Odd Fellows and the Ancient Order of United Workmen. He was medical examiner for different organizations and at one time of candidates for the United States Military Academy at West Point.

Dr. and Mrs. Allen had a long life together; on their fiftieth wedding anniversary, and on the fifty-sixth, they were honored by their many friends. Their only child was Caison Monroe Allen, who for twenty-five years after

1900 was cashier of the First State Bank of Wykoff, Fillmore County. Caison M. Allen was married on September 12, 1882, to Betty Cole, of Chatfield. In later years Mrs. C. M. Allen was an able teacher of music in the public schools of many southern Minnesota towns. She died at Wykoff on February 15, 1940; Caison M. Allen died in the Episcopal Church Home at Saint Paul on June 22, 1942. Their son and only child was L. Dana Allen, long of Winona and later of New York City, whose death occurred in Winona in November, 1937; burial was at Rochester.

After the death of Mrs. W. A. Allen, the doctor's friends chose his birthday on which to pay him their respects. On his one hundredth birthday, March 6, 1934, Rochester's esteemed oldest citizen, then in a hospital because of declining strength, eagerly received more than 500 callers. Some weeks later, as he sat writing, he stooped to pick up a postage stamp, his chair slipped, and he fell, suffering trauma and shock. His death resulted within a few days.

Ole W. Anderson (1840-1920) was born on May 22, 1840, near Bergen, Norway, and died in Rochester, Minnesota, on December 26, 1920, an accredited member of the medical profession of Minnesota; MINNESOTA MEDICINE carried a notice of his death. After the passage of the medical practice act of 1883 he received an exemption certificate to practice in the state, on the basis of professional knowledge and years of experience. His was an interesting as well as useful life, and his contribution to medicine, although remembered now by few, was of value in its day.

When Ole W. Anderson was about eight years old he came with his parents to the United States. The family settled in the region of Viroqua, Wisconsin, where they were farmers. In the sixties, a student of the natural sciences and a chemist and pharmacist, Mr. Anderson came to southern Minnesota. For a year or more he alternated between Olmsted County and Mower County and for a time was a contributor to a Norwegian newspaper, founded by Mr. Ole Jorgens, of Grand Meadow.

On July 3, 1865, Ole W. Anderson was married to Gunhild (this name later was anglicized to Julia) Lindelien, of Mower County, near Grand Meadow. Gunhild Lindelien was born in Bergen, Norway, on February 20, 1845, and when a small child came with her parents to southern Minnesota. In Rochester Mr. and Mrs. Anderson established their home on South Franklin Street, where were born their four children, Lillian B., J. William, Albert Oliver and G. Adolph. Life in the household, friends of the family recall, was one of a certain grace and dignity tempered by humor. The mother possessed beauty, a lovely singing voice and musical talent. Dr. Anderson was a tall, fine-looking man, slender when young, heavy but not ponderous when old, who always wore a full beard. A devoted reader of the Bible and the works of Pope, Milton, Byron, Shakespeare and Ruskin, he could quote long passages from each. A member of Rochester's Scandinavian Literary Society, he was one, as was Dr. William Netter, in Rochester in the early eighties, to give "Declamations," and he is remembered as a delightful raconteur of an endless fund of stories.

In May, 1867, O. W. Anderson, druggist and chemist, in a shop next to Head's Stationery Store, Rochester, called the attention of the city and the surrounding country to his New Drug Store, which was stocked with drugs, medicines, chemicals, pharmaceutical preparations, patent medicines, perfumeries, toilet goods, surgical instruments and miscellany and with "pure wines and liquors for medicinal purposes." He was a prohibitionist, at one time active in the Prohibitionist Party, and was as much opposed to tobacco as to alcohol. In December, 1867, he entered partnership with Dr. William W. Mayo, in Rochester since 1863, who made the drugstore his headquarters and put up and dispensed his own prescriptions. Although this alliance ended in the summer of 1869, the mutual respect and esteem of the two men continued; much later Dr. William J. Mayo, then an elderly man, spoke of Dr. Anderson as a fine citizen.

By 1870, well established as a manufacturing chemist and apothecary, O. W. Anderson was offering a long list of remedies of his own compounding, "the Norwegian Family Medicines": a few of the titles were, Hysteric Drops, Elixir of Life, Blood and Liver Renovator, and Compound Syrup of Blackberry Root. In the early years of the business he used a jobbing wagon, enclosed and bearing the legend, "O. W. Anderson's Medicines," which made long trips of distribution. In 1885 he fitted up the second story of La Due's Block on Broadway for a new and enlarged laboratory to supply the growing demand for his preparations.

Dr. Anderson made no pretension to clinical practice such as was carried on by graduate physicians of Rochester. He was essentially a chemist and apothecary, the latter in the early English meaning of the word, who prescribed and dispensed specially compounded tinctures and ointments. A distinguished physician of Rochester who from his youth knew the Anderson family intimately and had knowledge of Dr. Anderson's remedies, has said, "His medicines were of the very best, gave absolute satisfaction, and if they were still manufactured, there would still be a call for them." A son, Dr. G. A. Anderson, in 1945 wrote in regard to this opinion, "I believe that the statement which you quote is true . . . My brother Will was greatly disturbed not to be able to supply the demand, which continued to come long after my father's passing, when the remedies were no longer prepared. Regarding my father's medical practice, it is my impression that it was largely incidental to the distribution of the Norwegian Family Medicines, which he originated and prepared. These remedies were designed to meet the home requirements of the very large Norwegian population of Minnesota, Iowa and the Dakotas, among whom they had become household necessities, and they were sold through the wholesale houses of St. Paul and Minneapolis in great quantities. These consumers often appealed for personal attention and this was, in my opinion, the clientele which he served."

Dr. Anderson survived his wife, who died on June 13, 1913. Of their children, Lillian B. Anderson (1866-1914) was the wife of Dr. John Abraham Freeborn, of Ortonville and later of Fergus Falls; Dr. and Mrs. Freeborn had three daughters, all of whom were living in 1945: Gertrude Lillian (Mrs. Paul E.) Francis, Frances Mary (Mrs. Howard J.) Vandersluis, and Constance Margaret (Mrs. Elmer A.) Haugen. J. William Anderson (1868-1940), a respected and substantial citizen of Rochester, first assisted his father in the laboratory, later ran a printing office, and for twenty-five years was clerk of the municipal court; he lived all his life in the home where he was born, and in 1950 his wife continues to make it her home. Mrs. J. W. Anderson before her marriage was Verona Boelter, a registered nurse, member of a Rochester family. Albert Oliver Anderson (1873-) studied music in Chicago, New York, Paris and Berlin and in 1923 received the Fellowship degree of the American Guild of Organists. G. Adolph Anderson (1877-) on graduation from the Chicago College of Dental Surgery in 1901 became assistant to Dr. E. A. Bogue of New York City, but soon after entered private practice, specializing in the regulation of children's teeth. A landscape artist of merit, he began lessons with Mrs. Mary Catherine Livermore of Rochester, studied at the Art Students' League of New York and at the Académie Julien and Collorossi in Paris; his paintings, exhibited in America and in Europe, drew the favorable attention of John LaFarge (1835-1910). He was married in 1912 to Gertrude Gregory Pease, of Ridgewood, New Jersey, who died in 1917. Since 1928 Dr. Anderson and A. O. Anderson have lived at Mt. Tremper, in the Catskill Mountains, New York, where they conduct extensive work in reforestation (1946).

Amos L. Baker (1852-1932), son of Gorham Baker and Harriet Stowers Baker, was born near Sharon, Franklin County, Maine, on December 6, 1852. His parents were farmers, there were several children, and money was scarce, so that he earned his own way through school and college. After leaving the district schools, he entered Western State Normal School at Farmington, Maine, from which he was graduated in 1876, and in 1881 he finished the course of the Maine Central Institute, at Pittsfield, a classical school whose graduates were qualified to teach in high schools. For a year or two thereafter he taught in the public schools of Maine before coming, about 1883, to Dover, Olmsted County, Minnesota.

In Dover he served two years as superintendent of the village schools and at the same time read medicine under the direction of Dr. A. W. Stinchfield, of Eyota, a few miles west. The long summer vacations he spent in Dakota Territory, at Onida, where he took up a claim, and at Blunt, where he worked at carpentry to improve his finances. On Friday, June 12, 1885, the Dover schools, which had been "under the able management of Professor A. L. Baker, assisted by Mrs. Horace Witherstine," closed for the year. They were "never in more flourishing condition." Mr. Baker was removing to Eyota to study intensively with Dr. Stinchfield.

In the autumn of 1885 Amos L. Baker, more than ten years older than the average medical student, entered Rush Medical College at Chicago; he had sold the relinquishment of his Dakota claim to help with his expenses. In February, 1887, he was graduated with the degree of doctor of medicine and immediately afterward he left for Maine, where he was married to Lula E. Atwood, at Winterport, near Monroe, Waldo County. Miss Atwood, a native of Monroe, had been from 1882 to 1886 principal of the high school at Northfield, Minnesota; she and her husband first met in their student days at Maine Central Institute. Her brother Charles was a physician who practiced at Winterport until his death in the early 1900's; her sister Abbie was married to Dr. John Sewell, of Boston.

Dr. Baker began his initial medical practice at Plainview, Wabasha County, on June 15, 1887, filing with the clerk of court at Wabasha his state certificate No. 1448 (R), which had been issued five days earlier. During his residence in Plainview he occasionally substituted for Dr. Stinchfield and Dr. Nathaniel S. Lane, when those partners were at medical meetings. When Dr. Lane removed to North St. Paul in December, 1887, Dr. Stinchfield invited Dr. Baker into partnership.

For the next two years Dr. and Mrs. Baker were residents of Eyota. Cultured and intellectual, they were representative of down-East manners and customs in the finest tradition. In the vicinity of Dover and Eyota, where many pioneers from New England had settled, they found a congenial atmosphere and there as elsewhere they won and held the admiration and affectionate regard of all who knew them. They furthered civic and educational interests and were supporters of the Methodist Episcopal Church. The doctor was a member of the Masonic Lodge and the Independent Order of Odd Fellows.

From Eyota Dr. Baker removed in April, 1890, to Pleasant Grove, where a vacancy had existed since Dr. Alonzo W. Hill, the local physician from early days, left for the West in the previous autumn. In Pleasant Grove the Baker home and office were in the Russell House. In January, 1891, when a fire destroyed both household and professional equipment and even currency, the doctor in battling the flames incurred sciatica that disabled him for months. He was recovering and had leased new quarters when one day a delegation of citizens from Byron, in Kalmar Township, called to invite him to that village as resident physician. He accepted, bought the practice of Dr. Frank M. Johnson, who was leaving Byron for Dover, and by September 1, 1891, was established in the community that he was to serve well for the next nine years. When the Southern Minnesota Medical Association, of which he was a founder and sometime president, was holding its annual meeting at Rochester in August, 1893, the current officers authorized newspaper comment on "some of the leading members present"; "Dr. A. L. Baker of Byron is one of the best posted among the young men and is a rustler. He has secured a large practice in Byron, and that community is to be congratulated on having so good a man located in its midst."

In September, 1900, after Dr. Charles O. Wright had left Kasson, Dodge County, west of Byron, Dr. Baker with his wife and two daughters settled in that village, which for thirty-two years was the family home and the center of Dr. Baker's exceptionally active and intensive practice.

Dr. Baker was the invaluable village and country doctor of the best and highest type, in sympathy with the needs of the people, who had absolute confidence in him, and with the expanding function, scientific and humanitarian, of his profession. He served many terms as county physician in the different communities of his residence. A keen diagnostician of sound judgment, he had the important virtue that in a difficult case he never hesitated to call for professional consultation. He early became a constructive member of local county medical societies, the Southern Minnesota Medical Association, as noted, and of the Minnesota State Medical Society and the American Medical Association. By frequent clinical trips and postgraduate courses, notably at the New York Polyclinic Medical School and Hospital, and by additions to his library and therapeutic equipment he kept in touch with and aided medical advance.

In 1926 Dr. Baker retired from practice because of failing health; he died at Kasson on July 22, 1932, from cardiorenal disease, survived by Mrs. Baker and the two daughters. Ethel Baker Odden, a graduate of Winona Teachers College, is the wife of Knute Odden, a pharmacist, of Benson, Minnesota. Mr. and Mrs. Odden have three sons: Richard, with the United States Army during World War II; Robert, an electrical engineer with Farnsworth, in Indiana; and Lloyd, in his third year (1945) with the United States Merchant Marine. Vera Baker Tice, a graduate of Stout Institute, is married to Harvey A. Tice, native of Omro, Wisconsin, machine shop teacher at Technical High School of St. Cloud. After Dr. Baker's death Mrs. Baker made her home with Mrs. Tice, for eight years at Huron, South Dakota, and for one year at St. Cloud; she died at St. Cloud on January 26, 1941.

Nathan Morton Baker (1859-1928) was an assistant physician, the ninth appointee, on the staff of the Second Minnesota Hospital for Insane, at Rochester, Minnesota, from October, 1889, to May, 1893.

Born near St. Peter, Minnesota, in 1859, he received his preliminary education in the public schools of Le Sueur County and in St. Peter, Nicollet County, and in 1884 was graduated from the University of Minnesota with the degree of Bachelor of Arts. Subsequently he taught school and later was chemist at the laboratories of the state board of health at Red Wing. Having decided on the profession of medicine, he entered the medical department of the University of Pennsylvania, from which he was graduated in the spring of 1889. On his return to Minnesota he received, on July 6, 1889, as a resident of Goodhue County, license No. 65 (R) from the medical examining board of Minnesota; this certificate in due time he filed in Olmsted County.

During his years in Rochester Dr. Baker made annual trips of several weeks each to New York and Philadelphia for special medical study, and he became a member of the Olmsted County Medical Society and the Minnesota State Medical Society. Social circles found him an asset because of his personal worth and gracious ease and wit, and professional associates valued him in addition for his skill, his equable temper and his ethical conduct.

In May, 1893, Dr. Baker left Rochester for St. Peter, where he was called to serve as assistant superintendent of the Minnesota Hospital for Insane under Dr. H. A. Tomlinson. There again his record was excellent. When he resigned in May, 1895, to enter private practice in Spokane, Washington, the trustees of the hospital paid formal tribute to him as a fine man and conscientious physician.

In Spokane, where he married, Dr. Baker for more than thirty years conducted a general practice, with special interest in surgery. His offices for many years were in the Old National Bank Building, later in the Fernwell Building, and still later in the Paulsen Building. He was a member of the city board of health, of the Spokane County Medical Society (once its president), of the state medical organization and of the American Medical Association. His death occurred in Spokane in 1928.

Ira C. Bardwell, born in Wayne County, New York, in February, 1812, removed with his parents when he was seven years old to Livingston County, New York, where he received his early education and where, as a young man, he read medicine in the office of Dr. Champlain for a year and a half. He next went to Steuben County, New York, and from there to Willoughby, Ohio, where he studied and attended medical lectures two years. For the next few years, always trending west, he practiced medicine at different places, and in the early fifties was in Prophetstown, Illinois.

Early in 1856 Dr. Bardwell, a reputable physician and surgeon, arrived in Rochester, Olmsted County, Minnesota, accompanied by his wife, Louisa Cutler Bardwell, a native of Massachusetts, to whom he was married in 1837. Shortly after his arrival Dr. Bardwell was appointed to a two-year term as the first clerk of the district court for Olmsted County; he served at the first session of the court on April 4, 1856.

In 1859 with his family he left Rochester to settle in the prosperous village of Pleasant Grove in Pleasant Grove Township. Here for twenty-nine years, until the coming of Dr. Alonzo W. Hill, in 1878, he was the only active resident physician; vague reference has been noted to a Dr. Chase and to "the good and venerable Dr. Hunt" who were there in the sixties. Dr. Bardwell was esteemed as citizen and physician and he served his community well. He was local health officer; he was a Republican who faithfully attended county conventions; and a Mason, member of the Pleasant Grove lodge. In August, 1871, when a picnic was held on College Hill, in Rochester, for organization of the Olmsted County Old Settlers' Association, Dr. Bardwell was elected vice president for his section of the county.

Little has appeared about the children of Dr. and Mrs. Bardwell. In November, 1870, a daughter, Ella C. Bardwell, was married at the home of her parents to

J. C. Wagoner; in December, 1878, Ella Bardwell Wagoner was married to Adrien Peck. In the *History of Winona and Olmsted Counties,* of 1883, Mrs. Peck was mentioned as the only living child of Dr. and Mrs. Bardwell.

On April 6, 1883, the *Rochester Post* reported that Dr. Bardwell had sold his residence and other property in Pleasant Grove to D. W. Johnson. This sale no doubt was in preparation for removal to Dakota Territory; on June 13, 1884, the Rochester *Record and Union* noted the death in Sioux Falls of Mrs. Ira C. Bardwell, formerly of Pleasant Grove. It is probable that Dr. Bardwell, seventy-one years old in 1883, did not practice medicine in Dakota; his name does not appear in the roster of physicians who registered in Dakota Territory between June 5, 1885, and June 30, 1890.

For the sake of record: In certain old commercial directories Dr. Bardwell's initials appear in various inaccurate combinations, and in one work the name was printed "Bredwell."

Elbert E. Barnum (1851-1907) was for a few months a member of the medical profession of Olmsted County. Born in 1851, a graduate of the medical department of the University of Michigan in 1876, Dr. Barnum in August, 1884, settled in Eyota, Olmsted County, where he had his office in his residence, the "first door west of Walter Dixon's." Well qualified though he was, he stayed in Eyota so short a time as to leave little impress on the community. In the official directory of physicians of Minnesota for 1883-1890 Dr. Barnum was listed as resident at St. Peter, Nicollet County, holder of state license No. 1293 (R), which was issued on December 10, 1886. Prior to 1896 he was well established in Pine City, Pine County; he died there from pneumonia in January, 1907.

Marshall Thomas Bascomb (1851-1899), who spent his boyhood in Oronoco, Olmsted County, practiced medicine in Pleasant Grove from 1895 to 1899.

Newell Bascomb, father of Marshall Thomas Bascomb, was born on October 25, 1819, in Vermont, the son of Asa Bascomb and Abigail Palmer Bascomb, both of whom were natives of Franklin County, Vermont. Asa Bascomb served the United States on Lake Champlain in the War of 1812. Newell Bascomb in early life went to Cleveland, Ohio, and there and in Mount Vernon, Ohio, followed his trade of carpenter and joiner until 1855. In the autumn of that year he came to Oronoco, Minnesota, where he established a home and sent for his family. He had been married on March 12, 1843, to Mary A. Upton-Damon, daughter of George and Mary Upton-Damon, of Fairfax, Vermont. There were four children of the marriage: Orwin Newell was born on October 20, 1844, and died on April 12, 1865, in a military hospital at Gallatin, Tennessee, from disease incurred in line of duty in the United States Army during the Civil War. Edwin Gordon Bascomb was born on September 1, 1846; he was married on February 13, 1878, to Carrie Wheat, daughter of Dr. and Mrs. John N. Wheat of Austin; Dr. Wheat in the early eighties practiced for a year or two in Rochester. Sarah M. Bascomb was born on June 23, 1849, and was married on December 25, 1866, to Warren Wirt of Oronoco Township, and years later to Mr. Goodell of Oronoco.

Marshall T. Bascomb was born on November 18, 1851, and was four years old when, in a bitter December, Mrs. Bascomb with her young family made the hazardous trip to Minnesota to join her husband. Traveling overland from Ohio to Galena, Illinois, she caught the last steamer of the season to forge up the ice-clogged Mississippi. At La Crosse the boat was frozen at the levee, and it was two weeks before Mrs. Bascomb could get across the river on the last lap of her journey, over hills and prairies. Many travelers perished on the trails during that period, and Newell Bascomb had given his family up for lost when they at last arrived at Oronoco. Only the fact that Mrs. Bascomb had brought many bedclothes, which served as wraps, had saved them. As it was, Sarah and Marshall had frozen their feet.

Marshall T. Bascomb was a pupil in the schools of Oronoco and of Rochester and in the early seventies took a course of medical study at the University of Michigan. In 1875 he was married to Ella B. Cook, daughter of Mr. and Mrs. Martin W. Cook, respected pioneer citizens of Rochester. Martin W. Cook was a native of Canada; his wife was Mary Benedict, from Connecticut. In Olmsted County Mr. Cook was an inaugurator of dairying and fruit farming.

There is record that from 1877 to 1879 Dr. Bascomb practiced medicine in Brownsdale and in Grand Meadow, Mower County, and that for a year or more in 1880 and 1881 he practiced at Eau Galle, Wisconsin. The *Rochester Post* of October 28, 1881, reported that Dr. M. T. Bascomb had gone to Cleveland to attend medical college. On March 14, 1882, he received the degree of doctor of medicine at Western Reserve University and immediately afterward went to Clark, Clark County, Dakota Territory; under the medical practice act of Dakota, in 1885, he registered on July 9 of that year. While in Clark he was a member of the state board of health, in 1893-1894, and county coroner, 1894.

In 1895 Dr. Bascomb returned to Olmsted County to be near relatives, settled in Pleasant Grove, and opened a drugstore as an adjunct to the practice of medicine. The village had lacked a physician since Dr. A. L. Baker left for Byron in the summer of 1892, and Dr. Bascomb, able practitioner and upright citizen, jolly, likeable and good-looking, with his wife and two sons was well received. He had a general practice and at the same time devoted special attention to orthopedics, a field in which he studied to improve his knowledge and skill. He was a strong member of the Olmsted County Medical Society and the Southern Minnesota Medical Association. He served as local county physician during most of his years in Pleasant Grove. He was active in fraternal organizations, among them the Masonic Lodge, Knights of Pythias, Independent Order of Odd Fellows, the Ancient Order of United Workmen and the Modern Woodmen of America.

Dr. Bascomb by reason of personal qualities and professional service was one of Olmsted County's best known and most respected physicians. Regrettably his gradually failing health limited and shortened his career. He died in his forty-eighth year, on January 28, 1899, a few days after undergoing an operation for removal of gallstones, at St. Mary's Hospital, Rochester. He was survived by his wife, two sons, Fayette W. Bascomb and Marshall R. Bascomb, his mother, his sister Sarah and his brother, Edward G. Bascomb, of Austin.

Some weeks after Dr. Bascomb's death Dr. Simeon P. Meredith (*q.v.*), of Spring Valley, Fillmore County, bought the practice and drugstore, and Mrs. Bascomb removed to Rochester, and later to Minneapolis. She died in Hollywood, California, on July 11, 1931. The elder son, Fayette W. Bascomb, became a manufacturing chemist. The younger son, Marshall Royton Bascomb, in 1924 was graduated from the General Medical College of Illinois; in 1947 he was a practicing physician and surgeon at Maywood, Illinois. He was married on July 6, 1923, to Hulda E. Johnson; Dr. and Mrs. Bascomb have one son, a manufacturing chemist.

(To be Continued in the April issue)

President's Letter

WHY COMPROMISE?

NOW AND AGAIN some physician says, "The welfare trend is here. We can't stop it. Let's just compromise and salvage what we can."

That, in my opinion, is the worst type of defeatism. It does not demonstrate a broad-minded tolerance for alternative viewpoints as, superficially, it would seem to. No, it's cowardly thinking, lazy thinking and it has not even the saving grace of logic.

For there can be no compromise with facts.

Medicine has given the American people the highest standard of healthy living, the greatest research discoveries in history, more than twenty additional years of life expectancy and a freedom from disease and suffering never before and never elsewhere experienced.

These are facts.

Medicine is threatened now with a curtailment of its freedom, a regimentation into uniform mediocrity, through annexation by the government, that would not only destroy a proud profession but would rob Americans of the advantages they now possess and the great health-potential of the future.

These are facts.

The medical profession has, therefore, set out to tell these facts to the people who should know them—the people who, in a democratic way, will decide the issue. The education process is being financed by physicians who believe that Americans are as much entitled to the facts about health as they are to health itself. Every medium of communication is being taken into consideration, and no effort is being spared in this highly important educational work.

As in the case of those who would compromise with the facts, there are those in the profession who would compromise in the measures taken to ward off this first approach to the welfare state. These are the physicians whose contributions to the campaign are negative ones—who apparently think that their responsibility in the informational project is limited to criticizing the methods of conducting it.

This compromise of inaction is as disastrous as out and out opposition.

Unfortunately, some of our members, who failed to assume the obligation of an AMA assessment in 1949, have been guilty of a compromise of inaction that not only detracts from the financial backing necessary for a program of this scope and intensity, but weakens the spirit of unity and strength that should characterize the message of the American Family Doctor to the American public he serves.

Let's not be guilty here of further compromises with fact and action.

F. J. Elias.

President, Minnesota State Medical Association

DOCTOR ROSSEN—COMMISSIONER OF MENTAL HEALTH

THE dinner held at the Coffman Memorial Building at the University of Minnesota on the evening of February 2, 1950, served to publicise the assumption of duties of the first Commissioner of Mental Health of the State of Minnesota by Dr. Ralph Rossen. Appointed December 15, 1949, Dr. Rossen officially took charge on February 1. The dinner was arranged by a special committee, of which Dr. Ernest M. Hammes of Saint Paul was chairman, and was attended by some 950 individuals from all over the state who are interested in the new mental health program which has been so ably sponsored by Governor Youngdahl. The Governor, appropriately and with his usual ability, presided at the dinner and called upon a number of those active in the state's program who attested Dr. Rossen's qualifications and pledged him their support.

The care of the mentally ill has always been a neglected field. Commonly a long drawn out illness, most families have been forced to rely on state aid in the care of affected family members. As a rule, the care provided has been custodial only, and a hopeless attitude as to cure has been evident. Today such a pessimistic view is not justified, for a sizeable percentage of the mentally ill recover and resume their places in society.

There has been a growing consciousness that much too little was being done for the mentally ill by our State. The survey of the mental sanatoria by Mr. Ries, under the sponsorship of the Minnesota Unitarian Committee, of which the Reverend Arthur Forte was chairman, confirmed the suspicion. Our Governor, with his Advisory Council, backed the bill for increased appropriations which passed the Senate without a dissenting voice and was signed by the Governor on April 20, 1949. This provided for an increase of 15 million dollars in the appropriation over the last biennium for expanding the care of the mentally ill within the State. This includes the construction of new wings and buildings, modernizing the present institutions, the employment of enough personnel to man the institutions, a forty-hour week for institutional employes, a psychiatric training program to staff the hospitals, and a research program. The bill provides, in addition to the creation of a Commissioner of Mental Health, the appointment of two psychiatrists, a chief nurse, a chief psychiatric social worker, a chief dietitian, a chief psychologist, a personnel manager, and a supervisor of maintenance work.

In the not so distant past, the State appropriated but $1.50 a day for the over-all care of its mental patients which now number 14,000 in the ten state hospitals. This has been increased recently to $3.00 a day which is about half the $5.85 a day cost at the Veterans Psychiatric Hospital at St. Cloud. There is good reason to believe that with a sufficiently well-trained personnel, the turn-over of patients can be greatly increased to the benefit of patients and taxpayers.

In entering this new mental health program, Minnesota is taking its place among the states that are pioneers in this enlightened outlook in the care of the mentally ill. Other states will have their eyes upon us.

The choice of Dr. Ralph Rossen seems to have met unanimous approval. Born in Hibbing, Minnesota, he is a graduate of the University of Minnesota Medical School and has taken advanced degrees in psychiatry and neurology. Assistant superintendent at St. Peter in 1936 before serving as a Lieutenant Commander in the Navy, he became superintendent at the Hastings mental hospital at the age of twenty-eight. He is said to have done away with restraints at this hospital—no mean accomplishment. He is also said to have a personal acquaintance with all his patients. Our best wishes go to Dr. Rossen in his new undertaking. As he has stated, progress will of necessity be slow.

NATIONAL HEALTH PROPOSALS

PHYSICIANS who attended the Democratic-Farmer-Labor Conference on National Health Proposals at the Radisson Hotel in Minneapolis on Saturday, February 18, could not fail to be impressed with the importance of the health issues before the American people today. The meeting was supposed to be in the nature of a workshop for the presentation of various subjects such as the Truman Health Program, the Voluntary and Cooperative Health Plans, the points of view of the AMA and CIO, ending with a summary by Senator Hubert H. Humphrey.

Much of the program constituted fair and instructive presentations of the various health subjects. Dr. Elmer Hess, vice chairman of the Council on Medical Sciences of the AMA, gave an able presentation of the reasons members of the medical profession favor voluntary insurance plans to provide for the cost of medical care and are opposed to compulsory government insurance.

Roy Reuther, one of the three Reuther brothers of CIO fame and himself co-ordinator of political action of the United Auto Workers, let it be known in no uncertain terms that the members of his labor unions want government-supplied medical care and intend to attain their objective. He severely criticized the AMA for what he called its horse-and-buggy day attitudes in public relations. He claimed that the AMA had early opposed the principle of voluntary insurance plans recommended in the report of the Committee on the Cost of Medical Care which appeared in 1932; that support was given to the Blue Cross and Blue Shield plans only when the government threatened to supply this type of hospital and health insurance on a compulsory basis. He mentioned the Group Health experience in Washington, the 5,000,000 rejected draftees as a proof of the deplorable lack of medical care in our country, the necessity for compulsory $25.00 AMA dues because of the poor response of the membership on a voluntary basis, the low overhead cost of government-operated insurance compared with private insurance, and now the accusation of socialism and even communism when the proposal of compulsory government medical care is made. All of these statements merit more amplification than is possible here. Suffice it to say that many in the medical profession from the onset backed the voluntary insurance principle to meet the high cost of hospital care; that the medical profession deserves the credit for the Blue Shield which was advocated in certain quarters at least as far back as 1932; that there was considerable question as to the legality by the appropriation of government funds for the establishment of Group Health in Washington; that the number of rejections at the time of the draft for World War II does not constitute a deplorable condition of health amongst the American youth which could be bettered by compulsory government health insurance; that the $25.00 dues is to provide funds for informing the public about the advantages of free enterprise and is not a lobby fund (there is some truth to the statement that the response to the voluntary assessment of $25.00 in 1949 was not as great as it should have been); that government operation of any undertaking has always proven more expensive than private management. The insistence that compulsory government health insurance is not socialism is so absurd that it smacks of the psychology put forth in *Mein Kampf*. If a falsehood is repeated often enough, a certain amount of credence will result.

Our Senator Humphrey wound up the program with a summary of the national health proposals. His statement that the battle for national health insurance has already been won received widespread newspaper publicity. It was certainly a startling statement, and we beg to suggest that there may be room for some difference of opinion. He, being a member of the Committee on Labor and Public Welfare, should know whereof he speaks when he states that the Senate has already passed four of the seven points in Truman's Health Plan. According to Mr. Humphrey, all that remains to be done is to select one of the five health insurance bills now before the Senate. The total cost to the Federal Government of the Truman health proposals already passed by the Senate will amount to an estimated $300,000,000 a year, for which Senator Humphrey believes there will be more than due compensation by the cutting down in sickness and the saving of lives.

It was unfortunate that Senator Humphrey seemed so vindictive in his attitude toward the AMA and the local profession.* The Senator had

---

*The Senator claimed that the AMA had insulted Senator Murray of Montana by failing to answer his request for assistance in drawing up the 1946 Wagner-Murray-Dingell Bill. He also resented the statement which appeared in *The Bulletin of the Hennepin County Medical Society* of September, 1949 that "Senator Hubert H. Humphrey, with his usual agility to distort facts, stated that Reorganization Plan No. I was in line with the recommendations offered by the Hoover Commission." What happened was that the Task Force of the Hoover Commission which had to do with the reorganization of the medical activities of the Federal Government made a supplemental report which appeared in March, 1949, recommending that these governmental activities be established as a Health Department under a physician with the status of a Cabinet Officer instead of being included with Social Security and the Department of Education as a Welfare Department as provided in Reorganization Plan No. I. It is stated that Mr. Hoover gave his approval to Reorganization Plan No. I at the time hearings were being held by the Senate Committee. Thus the Hoover Commission made one recommendation and Mr. Hoover another. Therefore, a statement that Mr. Hoover recommended Reorganization Plan No. I would not have told the whole story. The medical profession also blocked the Reorganization Plan No. I which was backed by our Senator.

received many replies to the letters he had sent the profession asking for an expression of their opinion on health matters. So he must have known that his activities in Washington in backing President Truman's health plans have not met with their approval. Possibly the result of the recent poll of the *Minneapolis Tribune* has not been called to his attention. Whereas, according to the *Tribune's* poll held in February, 1949, 56 per cent favored a national health insurance and only 23 per cent were against it in September, 1949, in answer to the question as to whether one would like to see a health program similar to Britain's adopted in this country, only 29 per cent voted yes and 53 per cent voted no. This is very evidently a reversal in public opinion in Minnesota.

After all, our senators as well as representatives in Washington are supposed to represent the ideas and further the wishes of their constituents. They are the servants of the people, not their rulers, and are delegated to pass laws according to the wishes of their constituents. The Democratic platform in the last national election did not include a plank for compulsory government health insurance, and Senator Humphrey need not feel in duty bound to support such legislation on that score. We, the people, include a lot more than the officials of certain labor unions, and there are certain indications that we are beginning to arouse ourselves to oppose the extension of socialism in our country.

COURSE FOR NATIONAL GUARD AND RESERVE OFFICERS

For the convenience of National Guard and Reserve medical officers, the School of Aviation Medicine at Randolph Field, Texas, has divided its Aviation Medical Examiner course into three phases of three weeks each. It is anticipated that many National Guard and reserve officers who have been unable to leave their civilian practice long enough to take the course can now do so by taking it in installments of three weeks each. The only requirement is that they complete the nine weeks of special medical training over a period of four years. However, this does not preclude a National Guard or reserve officer from taking two phases of the course or the entire course in one year if he wishes to do so. The National Guard and reserve officers who take the course by phase will be required to complete their two weeks of flight indoctrination with the National Guard or reserve unit to which they are or may be assigned. On completion of the course they will be rated as Aviation Medical Examiners and qualified to serve as such with their respective National Guard and reserve units. After a year of such duty in the field, and on proper recommendation, they will be eligible to become flight surgeons.

OUR SOCIAL SECURITY

Our legislative and administrative difficulties with the Social Security Act have arisen largely from the fact that the Act sets up two competing methods for tackling dependency: social assistance and social insurance. The latter is a cruel hoax. Workers are not buying insurance; they are not paying premiums; they are paying an ordinary income tax.† They do not have a contractual agreement that for such and such a premium they will be entitled to a certain annuity at age 65. The workers of this country think they are paying for old-age annuities which will become payable at age 65. In reality they will not get anything unless they stop work, and unless they have had a specified number of years in covered employment. What they will get, if they get it, is a small wage-loss retirement annuity which will come to them as a gift from the Government, that is, from other taxpayers. These facts should be explained to the people so that we may have an end to all this talk about "benefits as rights."

The fact to be borne in mind is that millions of workers are destined to be fooled. Even now they are being cheated right and left, while the Government pockets the taxes without either paying benefits or returning what the individual has paid in. Thus a woman may work for 8 or 9 years before marriage and may never again return to the labor market. At age 65, if her husband has qualified under OASI, she will be insured by virtue of her married status and will be entitled to the fractional benefits accruing to her as wife or widow of an insured worker. However, she would have been entitled to those benefits even had she paid no taxes herself. She has thus been cheated out of 8 or 9 years' taxes for which she receives nothing at all. In the aggregate, the Government "saves" large sums by the scheme. I leave it to you to decide what name to apply to that sort of sharp practice.

I wish to call to your attention still another form of "saving" which Federal officials have in mind. There are now 3.5 million persons 65 and over who are entitled to benefits. Of this number 1.5 million have not applied for OASI benefits, presumably because they do not know their rights or are still working. During the next 50 years millions of workers will be cheated in this way. They will pay taxes for years but never collect anything. This is part of the Federal plan, not an accident. The Council of Economic Advisers to the President, in discussing this matter, states:

"The following table illustrates, for the next quarter century, the probable growth of the total aged population and of the numbers eligible for and receiving retirement benefits under proposed legislation. The estimates are based on our belief that many aged individuals will not retire voluntarily in an economy with abundant job opportunities. Accordingly, the number of individuals receiving benefits is estimated to be well below the number eligible under the insurance system."*—*American Medicine and the Political Scene,* February 2, 1950.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

ORGANIZATIONS IN STATE OPPOSE SOCIALIZED MEDICINE

Minnesota has 119 organizations on record against compulsory health insurance, making it eighth in the nation, according to a report issued by Dr. Elmer L. Henderson, chairman of the Campaign Co-ordinating Committee of the AMA's education campaign.

Much credit is given by Dr. Henderson to the state medical associations for their efforts to get state and local organizations to pass resolutions against socialized medicine. Continued action of the state medical association in making data available to the public, will assure an even better record for 1950.

Organizations on record against compulsory health insurance include 145 national, 480 state and 2,136 local groups, a total of 2,761 organizations, the report states. The first seven states and their total resolutions are: Indiana, 385; Illinois, 166; Pennsylvania, 160; Michigan, 152; New York, 140; West Virginia, 131; Ohio, 125.

Dr. Henderson notes that facts have proven the case against government medicine for these organizations. He says:

> "All organizations listed in this report have raised their voices in formal protest against compulsory health insurance.
>
> "They have studied the facts behind this important public issue, and by their action, have notified their national lawmakers that they are opposed to government control of medicine or for any further destruction of their basic American freedoms.
>
> "This is the 'grass roots' voice of the American people.
>
> "Numerous organizations are taking a position on a national issue for the first time—and doing it in spite of charter restrictions or partisan politics or precedent to the contrary. This is real proof of the growing recognition that the principles underlying this campaign are the same as those underlying democracy itself."

MEDICAL COSTS MORE EASILY PAID HERE

The cost of medical care, recurrent theme of government-medicine addicts, is not so much a problem to be answered in terms of dollars, but in time it takes a worker to earn those dollars. Economists point out that the important consideration is not that an appendectomy costs $150, but how long the patient has worked to earn $150 and the relationship of that sum to the price of other commodities.

The Standard Steel Spring company of Pennsylvania has released figures showing that, in the United States, it takes an average of thirty-eight and one-half hours of work to purchase a two-pants wool suit. The report states that an Englishman would work 163 hours for that same suit and a Russian, 506 hours. By the time the Russian earned enough to purchase one suit, the American could have bought thirteen. In other words, the American's earning power is about four times that of the Englishman and over ten times that of the Russian.

> "It is only natural, therefore, that Americans should own more commodities because their purchasing power is far greater. They are wealthier. In the United States one out of every four people owns a car; in socialist England there is one car for every twenty-two; in communist Russia, one for 252. In the free United States one of every three people owns a radio; in England there is one for five, and in Russia one for forty-five. Or take the telephone. In America there is one telephone for every five people; in socialist England there is one for every 155; in communist Russia there is one for every 188."

Americans, then, work fewer hours for the necessities and luxuries of life. But even in a democracy the cost of government is high (right now, to pay obligations of past wars, the average man must, each year, work eleven days; for defense and the cold war, twenty-four days; other federal expenses, twelve days; state and local taxes, fourteen days). And, if present "welfare" plans now before Congress are passed, Mr. American citizen will contribute one-third of his working time to the government.

ANALYSIS SHOWS UNITED STATES HEALTHIEST NATION

Despite figures showing that two other countries have a higher health index than the United States, Representative Donald L. Jackson, California, contends that American standards are highest. He reasons that advanced methods of statistical and medical research here make possible an analysis of national health that cannot be matched for accuracy.

He noted that there are statistics which show that other countries have a higher health index, but, he said, these statistics "should be carefully weighed to determine whether or not the published mortality figures exclude the aboriginal or native populations. The Maori tribes of New Zealand, which country is one of only two nations in the world with a better health index than the United States, are not computed in arriving at mortality and clinical data. In our own case, every segment of our population is considered in arriving at national health figures."

Research Advancing

Amplifying his thesis, Representative Jackson added:

> "In brief, American health standards are more adequate and more comprehensive than those of any other country in the world. When one looks for disease it will be found, but no one should draw any hasty conclusions or make comparisons of our national health on the basis of discovery and knowledge. We know of illness and disease here at home *only because our efficient clinical methods have brought the conditions to light.*"

Citing another aspect of the national health comparisons, he said, "Ours is the only country in the world today which is expending vast sums of money for research into the causes and cure of those diseases which are the great killers of our day."

Our health standards will stay as high as they are, and continue to improve as long as we can keep our health insurance on a voluntary basis. Mr. Jackson emphasized:

> "If the government is to assist in insuring better health to the American people, it is my opinion that the assistance can be better rendered at the local levels of government than by building a new Pentagon Building in Washington, D. C. . . . I believe that American ingenuity, proceeding on a voluntary and American basis, can meet the need for completely adequate protection."

SECURITY REPLACING FREEDOM AS GOAL

Many present-day Americans are trying to avoid the personal responsibility of freedom, Dean Russell of the Foundation for Economic Education says in his new pamphlet "Wards of the Government." By voting for men who promise to install a system of compulsory, government-guaranteed "security," they are voting for a partial return to the old slave laws of Georgia that guaranteed to all slaves "the right to food and raiment, to kind attention when sick, to maintenance in old age." Mr. Russell notes that the arguments used to foster the compulsory security program today are very similar to those used to defend slavery in Lincoln's day. For example, he says:

> ". . . many of the slaveholders claimed that they knew what was 'best for the slaves.' After all, hadn't the masters 'rescued' the slaves from a life of savagery? The advocates of government-guaranteed 'security' also claim that they know what is best for the people. Many of them argue in this fashion: 'After all, haven't the American people conclusively shown that they are incapable of handling the responsibility for their own welfare?'
>
> "Many of the slaveholders sincerely believed that the 'dumb, ignorant slaves' would starve to death unless their welfare was guaranteed by the masters. And the advocates of compulsory 'security' frequently say: 'Are you in favor of letting the people starve?' "

The advocates of government insurance seem to indicate that they believe all Americans are too ignorant, or lazy, or worthless to be trusted with their own responsibility of free choice in these matters, and it is quite true that those already receiving support from the state are led to expect, and to demand, more and more support from the state. Thus they become dependents.

The constitutions of former American slave states usually specified that the masters must provide their slaves with adequate housing, food, medical care and old age benefits. The Mississippi constitution contained this sentence:

> "The legislature shall have no power to pass laws for the emancipation of slaves . . . (except) where the slave shall have rendered the State some distinguished service;"

Apropos, Mr. Russell comments that the highest honor that Mississippi could offer a man for distinguished service to his country was personal responsibility for his own welfare.

> "His reward was freedom to find his own job and to have his own earnings, freedom to be responsible for his own housing, freedom to arrange for his own medical care, freedom to save for his own old age. In short, his reward was the individual opportunities—and the personal responsibilities—that have always distinguished a free man from a dependent.
>
> "What higher honor can any government offer?"

The Choice Is Ours

Mr. Russell gives this sound advice to those still fortunate enough to have a choice between freedom and government control:

> "Before choosing, however, consider this: When one chooses freedom, that is, personal responsibility, he should understand that his decision will not meet with popular approval. It is almost certain that he will be called vile names when he tries to explain that compulsory government 'security'—jobs, medicine, housing, and all the rest—is bad in principle and in its total effect; it saps character and strength by encouraging greed and weakness; it destroys the individual's God-given responsibility for self-help, respect, compassion and charity; in some degree, it automatically turns all who accept it into wards of the government; it will eventually turn a proud and responsible people into cringing dependence upon the whims of an all-powerful state; it is the primrose path to serfdom.
>
> "No, the choice is not an easy one. But then, the choice of freedom never has been easy. It never will be easy. Since this capacity for personal responsibility—freedom—is God's most precious gift to mankind, it requires the highest form of understanding and courage."

CONGRESS, BILLS AND TAXES

The 81st Congress is considering more bills relating to the public health and welfare than any United States Congress ever has, thereby emphasizing the omnipresent danger of not only compulsory medicine, but the entire gamut of government controls on the individual that socialism can bring.

During the first session there were 226 such bills on the docket; and, of this number, about sixteen related to health insurance and about sixty to social security. The 79th Congress had about seventy-five bills, and the 80th Congress considered a few more than 200 similar bills.

Most of these "security" bills, if passed, naturally would mean more taxes for the American people. The cost of the compulsory health insurance bill alone has been estimated often at 15 billion dollars per year.

But the individual, who already pays from 20 to 25 per cent of his wages in taxes to the government, should have even more cause for alarm over this raft of new taxes pending in the form of "security" bills. He may be interested to know that the federal government is taking 74 per cent of the total taxes collected and leaving only 26 per cent for state *and* local governments. Results: crippling of local responsibilities and individual freedom.

THE "ISM" MANIA

Nowadays when sociological planning is couched largely in "ism" words, it is interesting to consider a literal application of the theories being propounded. The Colorado Department of Agriculture makes its translation of theory by means of a simple bovine equation, thus:

Idealism: If you have two cows you milk them both, use all the milk you need and have enough left for everyone else.

Socialism: If you have two cows, you keep one and give the other to your neighbor.

Communism: If you have two cows, you give both to the Government; then the Government gives you back some milk.

Soft-Pink Communism: If you have two cows, you're a capitalist.

Imperialism: If you have two cows, you steal somebody's bull.

Capitalism: If you have two cows, you sell one cow and buy a bull.

New Dealism: If you have two cows, the government shoots one cow, you milk the other cow, then throw part of the milk down the sink.

Anarchism: If you have two cows, your neighbor shoots one and takes the other.

Nazism: If you have two cows, the government shoots you and takes both cows.

Realism: If you have two cows, they're both dry.

It is increasingly clear that screening the general population for tuberculosis must be combined and coordinated with other screening programs for other important pathological conditions—such as cardio-vascular disease, cancer, syphilis, and diabetes—similarly characterized by relatively long subclinical periods in which detection may be life conserving or important to community protection.—JAMES E. PERKINS, M.D., *Bull. Nat. Tuberc. A.*, January, 1950.

✦ Reports and Announcements ✦

INTERNATIONAL AND FOURTH AMERICAN CONGRESS ON OBSTETRICS AND GYNECOLOGY

The International and Fourth American Congress on Obstetrics and Gynecology will take place at the Statler Hotel, Chicago, May 14 through 19. Mornings will be devoted to addresses and discussions by well-known specialists from North America, South America and Europe.

Detailed information may be obtained from headquarters of the Congress at 161 East Erie Street, Chicago 11, Illinois.

AMERICAN ACADEMY OF NEUROLOGY

The American Academy of Neurology will hold its first interim meeting in Cincinnati on April 14 and 15, 1950. The meeting this year is being held in conjunction with the American Chapter of the International League Against Epilepsy which is meeting on April 15 and 16. On April 15 there will be a joint meeting between the two societies and a large symposium on psychomotor epilepsy.

AMERICAN ASSOCIATION OF INDUSTRIAL PHYSICIANS AND SURGEONS

The American Association of Industrial Physicians and Surgeons, with the allied groups comprising the American Conference of Governmental Industrial Hygienists, the American Industrial Hygiene Association, the American Association of Industrial Dentists and the American Association of Industrial Nurses, Inc., will hold its thirty-fifth annual meeting in Hotel Sherman, Chicago, from April 22 to 29.

The extension program consists of addresses, clinics, and panel sessions covering a great variety of problems encountered in industrial medicine. A number of industries in the Chicago area will arrange to have their medical departments and plants open during the week to those attending the conference.

AMERICAN CONGRESS OF PHYSICAL MEDICINE

The American Congress of Physical Medicine will hold its twenty-eighth annual scientific and clinical session, August 28, 29, 30, 31 and September 1, inclusive, at the Hotel Statler, Boston, Massachusetts. Scientific and clinical sessions will be given on the days of August 28, 29, 30, 31 and September 1. All sessions will be open to members of the medical profession in good standing with the American Medical Association. In addition to the scientific sessions, the annual instruction seminars will be held August 28, 29, 30 and 31. These seminars will be offered in two groups. One set of ten lectures will consist of basic subjects and attendance will be limited to physicians. One set of ten lectures will be more general in character and will be open to physicians as well as to therapists, who are registered with the American Registry of Physical Therapy Technicians or the American Occupational Therapy Association. Full information may be obtained by writing to the American Congress of Physical Medicine, 30 North Michigan Avenue, Chicago 2, Illinois.

AMERICAN BOARD OF OPHTHALMOLOGY

Candidates for the certificate of the American Board of Ophthalmology are accepted for examination on the evidence of a written qualifying test, held annually in various parts of the United States. Applications are now being accepted for the 1951 written test, and they will be considered in order of receipt until the quota is filled.

Practical examinations for acceptable candidates of 1950 will be held in Boston on May 22 to 26, in Chicago on October 2 to 6, and on the West Coast in January, 1951.

A new directory of all diplomates to date, arranged alphabetically and geographically, will be published early in 1950. No biographical material will be included.

Diplomates are urged to keep the Board office informed of all changes of address.

AMERICAN PHYSICIANS ART ASSOCIATION

The American Physicians Art Association will have its twelfth art exhibition in conjunction with the American Medical Association Convention at San Francisco Auditorium, June 26 to 30.

Any physician who follows the hobby of fine or applied arts can exhibit at this convention by becoming a member of the A.P.A.A. and applying for entry blanks and shipping labels of the secretary, F. H. Redewill, M.D., 526 Flood Bldg., San Francisco 2, Calif.

Over one hundred trophies will be awarded to advanced physician artists (A) as well as to beginners (B—who have done art work less than two years), the main purpose of the Association being to encourage all physicians to take up art in some form as an avocation.

Those physicians who have never done any painting, photography, sculpture, wood or metal craft, et cetera, can, without obligation, learn how to become creditable amateurs by writing to the secretary.

The American Physicians Art Association with its 4,000 members is recognized as having the finest amateur art shows in the world during the A.M.A. conventions, and the Association is desirous of having every physician who does art work to participate.

AMERICAN COLLEGE OF CHEST PHYSICIANS

The First International Congress on Diseases of the Chest will be held at the Carlo Forlanini Institute, Rome, Italy, September 17 to 20, under the auspices of the Council on International Affairs of the American College of Chest Physicians and the Carlo Forlanini Institute, with the patronage of the High Commissioner of Hygiene and Health, Italy, in collaboration with the National Institute of Health and the Italian Federation Against Tuberculosis.

Physicians who are interested in attending the Congress should communicate at once with Dr. Chevalier L. Jackson, chairman of the Council on International Affairs, American College of Chest Physicians, 500

NATIONAL GASTROENTEROLOGICAL ASSOCIATION 1950 AWARD CONTEST

The National Gastroenterological Association again takes pleasure in announcing its Annual Cash Prize Award Contest for 1950. One hundred dollars and a certificate of merit will be given for the best unpublished contribution on gastroenterology or allied subjects. Certificates will also be awarded those physicians whose contributions are deemed worthy.

Contestants residing in the United States must be members of the American Medical Association. Those residing in foreign countries must be members of a similar organization in their own country. The winning contribution will be selected by a board of impartial judges and the award is to be made at the Annual Convention Banquet of the National Gastroenterological Association in October of 1950.

Certificates awarded to other physicians will be mailed to them. The decision of the judges will be final. The Association reserves the exclusive right of publishing the winning contribution, and those receiving certificates of merit, in its official publication, *The Review of Gastroenterology*.

All entries for the 1950 prize should be limited to 5,000 words, be typewritten in English, prepared in manuscript form, submitted in five copies accompanied by an entry letter, and must be received not later than June 1. Entries should be addressed to the National Gastroenterological Association, 1819 Broadway, New York 23, N. Y.

CONTINUATION COURSES

Dermatology.—The University of Minnesota announces a continuation course in dermatology for doctors of medicine who are engaged in general practice. Throughout the course, emphasis will be placed on the diagnosis and management of common skin disorders. Presentations which will be of special interest include the psychosomatic aspects of skin disorders and a clinic on dermatological problems to be presented in University Hospitals.

A special feature at the close of the course will be a conference on diagnostic problems which will challenge the diagnostic ability of the registered physicians. The faculty for the course will be made up of clinical and full-time members of the staff of the University of Minnesota Medical School and Mayo Foundation.

This course will be presented at the Center for Continuation Study on March 27 to 29.

Gynecology.—The University of Minnesota announces a continuation course in gynecology for doctors of medicine engaged in private practice. The course will be presented at the Center for Continuation Study on April 17 to 19. Among the subjects to be considered are uterine bleeding, inflammation of the cervix uteri, urinary incontinence, and lesions of the vulva.

Cardiovascular Disease.—The Center for Continuation Study announces a continuation course in cardiovascular diseases for general physicians on April 20 to 22. The course is sponsored by the Minnesota Heart Association, the Minnesota State Medical Association, and the Minnesota Department of Health. A limited number of Minnesota physicians will attend as guests of the Minnesota Department of Health. It is hoped that this course will accommodate the large number of physicians who could not be accepted for a similar course which was given in January.

Otolaryngology.—The University of Minnesota announces the seventh biennial continuation course in otolaryngology, to be held June 26 to 30. This course is designed to bring to the practicing otolaryngologist the newer concepts and developments in the specialty. The course will be under the direction of Dr. Lawrence R. Boies and associates of the University Medical School. Dr. Fred A. Figi, Dr. Henry L. Williams and others of the Graduate School faculty will participate in the instruction. Guest lecturers will include Dr. Percy Ireland, Toronto; Dr. LeRoy Schall, Boston; Dr. Philip Meltzer, Boston; and Dr. John Shea, Memphis.

The fee for this course is $50. The enrollment is limited. Application should be made at an early date to the Director, Center for Continuation Study, University of Minnesota, Minneapolis 14, Minnesota.

BLUE EARTH VALLEY SOCIETY

Approximately thirty-five physicians from Faribault and Martin Counties attended a meeting of the Blue Earth Valley Medical Society in Fairmont on January 12. The principal feature of the program was a discussion of bone surgery by Dr. Maynard Nelson, Dr. Daniel Moos and Dr. Earl C. Henrikson, all of Minneapolis.

MC LEOD COUNTY SOCIETY

Election of officers highlighted the monthly meeting of the McLeod County Medical Society in Hutchinson on January 19. Dr. Arthur Neumaier, Glencoe, was elected president of the organization, and Dr. L. L. Kallestad, Brownton, was named secretary-treasurer.

WASHINGTON COUNTY SOCIETY

The regular monthly meeting of the Washington County Medical Society was held February 4. Forms submitted by the Washington County Welfare Board were discussed, and it was decided to communicate with the state medical association and other county societies regarding them.

Dr. Manley F. Juergens was elected to membership on transfer from the Red River Valley Medical Society. He formerly practiced at Thief River Falls.

A technicolor motion picture on pentothal sodium in obstetrics was presented at the meeting and met with enthusiastic approval.

Announcing . . .

The First
NEUROLOGIC CENTER FOR CIVILIANS
in the Northwest

Governor Luther Youngdahl formally opened and dedicated our neurologic center and opened the doors to the public on February 12, 1950, thereby offering the following new services:

1) treatment of the hemiplegic patient
2) multiple sclerosis
3) retraining of speech disorders
4) paraplegia and other paralyses
5) ataxias

Qualified neurologists and neurosurgeons staff this center. The staff also includes qualified personnel who have been trained in special therapy, occupational therapy, corrective therapy and physical therapy.

◆ Woman's Auxiliary ◆

PUBLIC RELATIONS WOMAN LAUDS AUXILIARY WORK

More than half of the women in the Auxilary to the American Medical Association crusade actively on behalf of the National Education Campaign, according to Mrs. Paul C. Craig, Reading, Pennsylvania, National Auxiliary public relations chairman. Mrs. Craig spoke at the second annual conference of the National Education campaign of the American Medical Association in Chicago on February 12.

Mrs. Craig pointed out that the Auxiliary in no sense wants to go out doing things on its own, but wants to co-operate with the medical society of which it is an active part. "The Auxiliary appreciates recognition and the accompanying responsibility," she said.

The Auxiliary is now twenty-eight years old and has approximately 50,000 members, Mrs. Craig continued, pledging the women in the organization to continued furthering of the educational campaign of the AMA.

Mrs. Craig, wife of a Reading, Pennsylvania, ophthalmologist, has been associated with the national and the Pennsylvania auxiliary for many years. She became vice president of the Pennsylvania auxiliary in 1946 and then served as president during 1948-49. She is a member of the American Dietitic association and the Daughters of the American Revolution.

Liaison Officer Named

Following Mrs. Craig's talk, it was announced that Dr. Ernest B. Howard, assistant secretary of the AMA, had been named liasion man between the Auxiliary and the Board of Trustees. The announcement was made by Dr. Elmer L. Henderson, president-elect of the AMA and chairman of the Campaign Co-ordinating Committee.

NEW CAMPAIGN MATERIALS NOW AVAILABLE

Continuing efforts in the campaign against compulsory health insurance, which the Auxiliary has actively aided, will be bolstered by the availability of several new pamphlets and the revision of two standard ones.

The new ones include two by Harold E. Stassen, president of Pennsylvania university, entitled "Never! Never! Never!" and "Granny Is Gone!"

The first pamphlet in the series, based on Stassen's study of the British national health scheme, takes its dramatic title from one doctor's simple warning: "Please tell our friends in America never, never, never adopt such a program!"

The second is the story of Granny, a sixty-two-year-old woman who couldn't get a hospital bed and subsequently died of pneumonia. Stassen offers this case as a sample of what is happening in Britain today. He concludes: ". . . apprehension was later revealed by a London doctor. He told me emphatically: 'I believe this system is in to stay. I therefore have nothing whatever to say for it or against it.' "

"He was afraid to speak out. But the story of Granny and thousands of her countrymen—and the facts of the operation of the system—speak clearly for him."

Another new pamphlet, entitled "Nationalized Medicine and the Welfare State," connects compulsory health insurance with socialism, by pointing out that socialism is approached by way of the welfare state "in which the early emphasis is on measures for increasing physical comfort including provision for medical care." It warns that Americans are on the way and should rise to defend individual democracy: "When the American citizen learns that the regimentation of war, to which he willingly acquiesced as a patriotic duty, is to be renewed and extended in peace-time by a compulsory tax to pay for something he does not want, he will assert his own right to choose his doctor and his medical service."

Also available is a reprinted address, "Socialized Medicine," given by Louis H. Bauer, chairman of the Board of Trustees of the AMA, which gives a down-to-earth analysis of the compulsory health insurance situation and what it would mean. Through definition and explanation, Dr. Bauer compares the British system with the proposed compulsory health insurance bill and concludes that it is necessary to get back to the philosophy of Lincoln in his famous remark, "government of the people, by the people, for the people."

"The Doctor Brushed Off Utopia" by Henry La Cossitt, tells the story of a British doctor who argues the case against socialized medicine. Disgusted with red tape and the impossibility of giving *good* medical care to his forty to fifty patients a day, he left England, to practice medicine in America. It is the first-hand story of a doctor swamped by too many patients and too many forms.

A new pamphlet for distribution by druggists, called "Profit or Freedom?" emphasizes the druggists' part in the fight for the voluntary way of obtaining health insurance.

The twelve-point program for the advancement of medicine and public health, developed by the AMA, is also available in pamphlet form. It gives a statement and explanation of each point, together with supporting statistics.

Revision means improvement in two pamphlets of standard use. The first, "The Voluntary Way is the American Way," has a new cover and is revamped to let appearance aid in the fight. It answers forty questions, instead of the previous fifty, on "health insurance—compulsory or voluntary." The second, "The Doctor," changes somewhat in content, making better and more convincing use of facts and figures.

Any of these publications may be obtained by writing to the office of the Minnesota State Medical Association.

ANNUAL MEETING COMMITTEE HEADS NAMED

Mrs. S. N. Litman
St. Louis County Medical Society

Mrs. Anthony J. Bianco and Mrs. Kenneth W. Teich were appointed by Mrs. John K. Butler, president of the Women's Auxiliary to St. Louis County Medical Society, as chairman and co-chairman for the Minnesota State Auxiliary annual meeting. The meeting will be in Duluth on June 12, 13 and 14.

Dr. F. J. Elias, president of the Minnesota State Medical Association, addressed the St. Louis County Medical Society auxiliary at the second session of the study class held February 14.

AUXILIARY HELPS HOSPITAL WORK

Mrs. Byron B. Cochrane
Goodhue County Medical Society

Members of the Auxiliary to the Goodhue County Medical Society have been helping to refurnish a room for pediatric cases in a local hospital. Members donated toys and have made stuffed toys at monthly meetings. Future plans include supplying children's furniture for the room.

Another new project was a plan to visit older patients in the hospital. Each member was made responsible for one old person and plans to visit him on his birthday and provide refreshments.

The source of Aminosol, animal blood fibrin, is one of the highest biologic value proteins. As a hydrolysate, Aminosol contains all the essential amino acids in the correct pattern for optimum tissue repletion.

Clinical usage has shown Aminosol may safely serve as the *only* intake of amino acids (2000 cc. daily for a 70-Kg. man) or as a dietary supplement in critical or prolonged illnesses (1000 cc. daily).

Stable for two years or more, Aminosol is sterilized by filtration and autoclaving. Rigid tests prove each manufactured lot pyrogen- and antigen-free. It is available in 250-cc., 500-cc. and 1000-cc. containers. A sure way to preserve the safety of Aminosol in venoclysis is to employ sterile, disposable Venopak* equipment—which has a strip of gum rubber tubing next to the needle adapter for easy injection of vitamin B complex or vitamin C during the infusion. For detailed literature on the Aminosol line of Abbott's parenteral solutions, take a moment now to drop a card to Abbott Laboratories, North Chicago, Illinois.

In Memoriam

CHARLES WILLIAM CUTLER

Dr. Charles W. Cutler of Park Rapids, Minnesota, died on November 3, 1949, at the age of ninety-one, following fracture of the hip. Dr. Cutler was a graduate of Rush Medical College of the class of 1880. He served as county commissioner and village health officer and was a director of the State Bank of Park Rapids.

JOHN ESSER

Dr. John Esser of Perham, Minnesota, died January 26, 1950, at the age of sixty-six.

Dr. Esser was born in St. Cloud, Wisconsin, June 10, 1883. He graduated from the high school in Austin, Minnesota, in 1902 and from the medical school of the University of Minnesota in 1908. His internship was served at Bethesda Hospital, Saint Paul.

He was most active in local affairs, having been mayor of Perham for four years, president of the Chamber of Commerce in 1925, a member of the State Board of Health, chairman of the Board of Health at Perham and on the county Board of Health for six years.

Dr. Esser was a member of the Park Region District and County Medical Society, the Minnesota State Medical Association and American Medical Association.

In 1909, Dr. Esser married Lucy Belle Wallace. Mrs. Esser and an adopted son, John, survive him. His brother, Dr. J. C. Esser of Seattle, and sister, Mrs. Lina Johnson of Blooming Prairie, also survive him.

JOHN CHARNLEY McKINLEY

Dr. J. C. McKinley, formerly professor of neuropsychiatry and head of the Department of Medicine at the University of Minnesota Medical School, died following an illness of four and one-half years, on January 3, 1950.

Dr. McKinley was born in Duluth, Minnesota, on November 8, 1891. His primary schooling was obtained in Duluth public schools, following which he attended Central High School in Duluth, West High School in Minneapolis and the Horace Mann High School in New York City.

He attended the University of Minnesota where he obtained his B.S. degree in 1915, and later M.A. in Anatomy, his thesis subject being "Myology of the Newborn Infant." He received his M.D. degree at the University of Minnesota in 1919 and Ph.D. in Neuropsychiatry in 1921, his thesis subject being "The Intraneural Plexus of Fasciculi and Fibers in the Sciatic Nerve."

Dr. McKinley held the following appointments at the University of Minnesota during his academic career:

Student Assistant in Anatomy—1915-1917
Instructor in Pathology—1917-1918
Teaching Fellow in Neuropsychiatry—1918-1921
Associate Professor of Neuropathology—1921-1925
Associate Professor of Neurology—1925-1929
Professor of Neuropsychiatry—1925-1945
Acting Head of the entire Department of Medicine—1932-1943
Head of the Department of Neuropsychiatry and Director of the Psychopathic Unit at the University of Minnesota Hospitals—1943-1945
Professor Emeritus of Psychiatry and Neurology at the University of Minnesota—1946 until the time of his death.

In 1928 Dr. McKinley received a John Simon Guggenheim Fellowship and studied in Europe at Breslau and Munich.

Dr. McKinley held many very important positions in organizations in his special field. He was a member of the Board of Directors of the American Board of Psychiatry and Neurology from 1941-1945. He was chairman of the Committee on Nervous and Mental Diseases of the Minnesota State Medical Association from 1943-1945. He was president of the Minnesota Pathological Society from 1946 to 1947, and president of the Central Neuropsychiatric Association in 1939.

Dr. McKinley was a member of many societies, among which were the Minnesota Society of Psychiatry and Neurology, the Minnesota Academy of Medicine, the Central Clinical Research Club, the Central Neuropsychiatric Association, and the American Neurological Association. He was also a Fellow of the American Association for the Advancement of Science, the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association.

He was a member of a number of honor societies, including Alpha Omega Alpha and Sigma Xi.

Dr. McKinley, during his career, published a large number of scientific articles. He was editor of the *Outlines of Neuropsychiatry* and co-author with Dr. S. R. Hathaway of the Minnesota Multiphasic Personality Inventory. He was listed in Who's Who in America, Who's Who in American Men of Science, Who's Important in Medicine, Biographical Encyclopedia of the World, Who's Who in American Education, and Who's Who in Minnesota.

CHARLES LEROY RODGERS

Dr. Charles L. Rodgers, for the past seven years medical officer at the Minnesota Soldiers' Home, Minneapolis, died on December 15, 1949, at the age of sixty-seven.

Dr. Rodgers was born February 15, 1882, at Farmington, Minnesota. He graduated from the University of Minnesota medical school in 1907. He is survived by his wife, Frances; two brothers, Walter S. and James, both of Minneapolis, and a sister, Nancy, also living in Minneapolis.

Of General Interest

Dr. Paul R. Hawley has resigned his position as chief executive officer of the Blue Cross and Blue Shield Commissions to become the director of the American College of Surgeons. The change became effective on March 1. Dr. Hawley is retaining the presidency of the Blue Cross's Health Service, Inc., which was charted in Illinois in November as a national insurance company designed to offer uniform benefits to employes of large industrial organizations operating in the areas of several of the Blue Cross plans.

* * *

Dr. Stanley W. Olson, assistant director of the Mayo Foundation at Rochester, has been named dean of the College of Medicine at the University of Illinois.

* * *

At a meeting of the American College of Allergists in St. Louis on January 15 to 18, **Dr. Albert V. Stoesser,** Minneapolis, was elected to the newly created position of assistant secretary-treasurer. He was also appointed chairman of the Program Committee for the next meeting of the College, which will be held in Chicago in February, 1951.

* * *

Dr. Edward B. Kinports, International Falls, showed slides on thoracic surgery at a meeting of the Border Registered Nurses Club in International Falls on January 23.

* * *

On January 25, **Dr. Albert C. Martin** officially began medical practice in Luverne when he opened offices in the Pengra Building. A graduate of the University of Illinois College of Medicine, Dr. Martin has been engaged in private practice near Chicago for the past three years.

* * *

Representative Martin of Massachusetts recently submitted figures to the House Ways and Means Committee showing that in 1946 **grants-in-aid to the states** amounted to $645,000,000. This was quite a sizeable sum. In 1948, however, it was $1,418,000,000. This was also quite a sizeable sum. We haven't as yet the figures for 1949. Included in the total were: $39,252,000 for public health, $21,409,000 for maternal and child health and welfare, $573,304,000 for old age assistance, $141,738,000 for aid to dependent children, and $16,947,000 for aid to the blind. We paid this enormous amount in taxes, paid U. S. government employes to collect and pay it back to the different states to supplement funds raised by voluntary subscription and state taxes. Let it be clearly understood—there is nothing free about these grants-in-aid.

* * *

Dr. C. L. Sherman, Luverne, has been appointed coroner and county health officer of Rock County. He succeeds Dr. J. S. Burleigh, who resigned to join the staff of the Minneapolis Veterans Hospital.

* * *

Announcement has been made of the engagement of Miss Olive Constance Hurlock of Oakland, California, to **Dr. Harry Ogden,** son of Dr. and Mrs. Warner Ogden of Saint Paul. Both are stationed at the U. S. Naval Hospital at Bremerton, Washington. The wedding is planned for early April in San Francisco.

* * *

Dr. Vincent Ryding, who has practiced at Howard Lake for the past four years, has accepted a surgical residency at the Methodist Hospital, Dallas, Texas. The hospital is affiliated with the Southwest Medical University at Dallas. Dr. Ryding will begin his new duties on July 1.

* * *

Dr. J. T. Holcomb of Marine-on-St. Croix has been spending the winter in Phoenix, Arizona.

* * *

The Minnesota branch of the American Medical Women's Association held a dinner meeting at the Colony Restaurant, Minneapolis, on January 28. Following a business session, **Dr. Nora Winther** showed motion pictures of her European trip. Eighteen members were in attendance, all from the Twin Cities.

* * *

Announcement has been made of the existence of **vacancies for full-time physicians** in the Veterans Administration Regional Office in San Antonio, Texas. The announcement was made by Dr. A. S. Brussell, a graduate of the University of Minnesota in 1933, now chief medical officer of the San Antonio VA office.

Salary range for these positions is $6,400 to $11 000 a year, with liberal annual and sick leave and retirement privileges. Qualified candidates for the positions can apply to Dr. Brussell at the regional office, 307 Dyer Avenue, San Antonio, Texas.

* * *

Dr. Lloyd Nelson, Minneapolis, spoke on the subject of respiratory allergy in children at a meeting of the Stearns-Benton County Medical Society in St. Cloud on February 16. Dr. Nelson is associated in practice with Dr. Albert V. Stoesser.

* * *

Northfield acquired a new physician when **Dr. J. Richard Utne** moved there on February 1 to become associated in practice with Dr. S. T. Kucera. A graduate of the University of Illinois College of Medicine in 1948, Dr. Utne served his internship at Minneapolis General Hospital. He recently completed seven months of practice in Minneapolis.

Not just milk replacement but casein replacement...

Casein—and also lactalbumin—are frequently the cause of hypersensitiveness to cow's milk. This hypersensitiveness can be manifested by gastrointestinal upsets followed in time by eczema of a mild or acute nature. In such cases cow's milk of all types must be eliminated from the diet. Mull-Soy is the near equivalent for milk to be used in these cases.

	Mull-Soy diluted with equal volume of water	Average whole cow's milk
Calories per fl. oz.	20	20
Protein	3.1%	3.3%
Fat	4.0%	3.8%
Carbohydrate	4.5%	4.9%
Total Minerals	1.0%	0.7%
Water	87.2%	87.3%

"Socialized Medicine" was the title of a talk given by **Dr. Martin O. Wallace,** Duluth, at a meeting of Duluth Scottish Rite groups on February 9.

* * *

Approximately 1,200 New Ulm school children, as well as some from surrounding rural schools, received inoculations against diphtheria and tetanus at special clinics on January 25. The clinics, which were conducted through the co-operation of all New Ulm physicians, were under the direction of **Dr. C. A. Saffert,** city health officer.

* * *

Dr. Paul Nyberg, formerly of Latvia and now on the staff of Bethesda Hospital, Saint Paul, was the principal speaker at a meeting of the Auxiliary to the Ramsey County Medical Society in Saint Paul on January 23. The title of his talk was "Practicing Medicine Under Nazi Regime."

* * *

After two years of practice in Detroit Lakes, **Dr. Gerald E. Bourget** left on February 1 to open offices for the practice of medicine in Hudson, Wisconsin. In Detroit Lakes he was associated with Dr. L. H. Rutledge.

* * *

Dr. D. P. Bernard has announced the opening of offices for the practice of medicine at 3400 Dakota Avenue, St. Louis Park (Minneapolis suburb). A graduate of Marquette University Medical School, Dr. Bernard interned at Minneapolis General Hospital, then served in the Army for three and one-half years during the war. For a time he was associated in practice with Dr. Alton C. Olson at the Nicollet-Lake Medical Clinic, Minneapolis.

* * *

The Saint Paul Archdiocesan Council of Catholic Nurses has organized the **Our Lady of Sorrow Nursing Guild,** the purpose of which is to provide volunteer nursing care for critically ill, hospitalized patients of any color or creed who would otherwise be unable to afford such care. The designation of patients to be the recipients of such free nursing care is to be by the attending physician and the head nurse on the floor. The plan has been instituted in certain Saint Paul hospitals.

* * *

Dr. Nelson Bradley, clinical director at the Hastings State Mental Hospital for the past two years, has been chosen superintendent of the hospital to replace Dr. Ralph Rossen. Dr. Bradley assumed his new office on February 1.

A graduate of the University of Alberta, Canada, Dr. Bradley took postgraduate work at the University of Minnesota. In 1943 he joined the Canadian Army Medical Corps and did psychiatric work in England. He was released from the army in 1946.

* * *

At a meeting of the Democratic-Farmer-Labor women of Minneapolis on February 4, **Dr. Frederic J. Kottke,** associate professor of physical medicine at the University of Minnesota, spoke on health legislation facing the 81st Congress.

* * *

Dr. W. L. Benedict, Rochester, was honored at a coffee party given on February 1 by members of the Worrall Hospital ophthalmology staff. He was presented with an album depicting his work in the hospital.

* * *

At a meeting of the **Saint Paul Surgical Society** on January 25, Dr. John J. Culligan was elected president of the organization. Dr. Victor Hauser was named vice president, and Dr. William F. Hartfiel, secretary-treasurer. Principal speaker at the meeting was Dr. George T. Pack, attending surgeon of the Memorial Cancer Center, New York City, and clinical professor of surgery at New York Medical College.

* * *

Dr. Robert J. Brimi has joined the medical staff of the Richards Clinic in St. Cloud. A graduate of the University of Minnesota Medical School in 1944, Dr. Brimi served his internship and a residency in pathology at the Wayne County General Hospital, Detroit, Michigan. After serving for two years in the Army, he spent two years as a medical fellow at the University of Minnesota. He specializes in the field of internal medicine.

* * *

On February 1, **Dr. William O. Finkelnburg,** a former resident of Winona, returned to Winona to become associated in practice with Dr. Irving W. Steiner. A graduate of the University of Minnesota Medical School in 1941, Dr. Finkelnburg interned at Ancker Hospital, Saint Paul. After serving in the the Army for three years, he began a residency in surgery at Ancker Hospital in 1946 and completed it in January, 1949. During the past year he was associated in practice with Dr. Stanley R. Maxeiner, Minneapolis.

* * *

Dr. Frederick W. Wittich, Minneapolis, was re-elected secretary-treasurer of the American College of Allergists at its meeting in St. Louis, Missouri, January 15 to 18.

* * *

It was announced on January 22 that the library of the St. Louis County Medical Society would be incorporated as the **David L. Tilderquist Memorial Library,** to pay tribute to the late Dr. Tilderquist, Duluth ophthalmologist and otolaryngologist. Dr. Tilderquist, who died on September 26, 1948, has been described as having been the library's "best friend and most avid patron." Naming the library after him is the result of a study to find a suitable memorial to the physician whose professional efforts set an enduring example for his colleagues.

The memorial corporation, which will be separate from the medical society, will have its own board of directors and governing regulations. At present the library has nearly 3,000 bound volumes including texts and periodicals, and receives 105 weekly, monthly and quarterly periodicals on medicine.

THE FINAL OF A SERIES

We are using the opportunity afforded by the advertising facilities of Minnesota Medicine to discuss Municipal securities for investment of your savings.

This article will merely summarize the important points concerning Municipal securities as outlined in the four previous discussions. Be sure to bear in mind these important factors when considering your next investment.

1. Next to United States Government Bonds, municipal securities have proven themselves to be the safest form of investment.
2. Under present laws, income received from them is exempt from Federal Income taxes.
3. They are available in a wide range of maturities, geographical location, types and interest rates to fit the needs of large or small individual investors, trust funds, insurance companies and banks.
4. They are secured by taxes levied on real and personal property, earnings of municipal utilities such as water, electric light and gas systems, by assessments against property benefited by local improvements or by other municipal revenue.
5. The taxes levied for their payment constitute a lien prior to a first mortgage on real or personal property.
6. We are merchants dealing exclusively in municipal securities and believe that our experience in this field will be helpful to you.

IF YOU WISH TO RECEIVE OUR MUNICIPAL OFFERINGS OR OBTAIN A COPY OF OUR TAX FREE VS. TAXABLE INCOME CHART FILL IN THE ENCLOSED BLANK AND MAIL TO US.

Dr. E. P. Strathern, retired St. Peter physician, vas honored at the annual meeting of the St. Peter Civic and Commerce Association on January 18. The eighty-one-year-old physician completed fifty ears of medical practice in St. Peter last December. Nearly 100 businessmen attended the honor meeting t which Dr. Strathern received an original painted archment scroll, a lifetime membership in the organization.

* * *

Announcement was made on January 24 that **Dr. Russell H. Frost,** director of tuberculosis work in ten Midwestern states for the Veterans Administration, had been named superintendent of the Glen Lake Sanatorium. The appointment, which became effective on March 1, ended a six-month search for a successor to Dr. Ernest S. Mariette, who resigned because of ill health after thirty-three years as superintendent.

A graduate of the University of Minnesota Medical School, Dr. Frost has had experience as a physician, as a sanatorium administrator, and as a member of the Navy medical corps in World War II. At the time of his appointment to the Glen Lake post, he was stationed at Fort Snelling as chief of the tuberculosis service at the area medical office and acting attendant physician on the staff.

Farewell ceremonies were held in Winsted on January 22 for **Dr. Edwin E. Shrader,** who was retiring from active practice and moving to Watertown to live. More than 400 persons gathered at the high school auditorium to say goodbye to Dr. Shrader and to present him with gifts. Dr. Shrader, now eighty-seven years of age, began his medical practice in Watertown in 1893.

* * *

Dr. John R. Earl, Saint Paul physician, was elected president of the Minnesota Council of Churches at its annual meeting in Saint Paul on January 19.

* * *

The **Lakeland Medical Center** has been completed in Willmar by five physicians. They are Dr. Robert J. Hodapp, Dr. Robert V. Hodapp, Dr. Douglas L. Jacobs, Dr. Lloyd C. Gilman and Dr. Ray K. Proeschel. The newly constructed building, costing $200,000, houses offices, laboratories and x-ray facilities. Dimensions of the structure are 120 by 42 feet, with two floors, the second floor housing eight residential apartments.

* * *

Dr. Benjamin Spock, staff member of the Child Health Institute in Rochester, was a speaker at the annual meeting of the Family and Children's Service in Minneapolis on January 25. Title of his talk was "What Is Discipline for Children?"

* * *

January 18 marked the ninety-fourth birthday of **Dr. George Haggard** of Minneapolis, Minnesota's oldest active physician. Though Dr. Haggard no longer goes out on calls, he still sees some patients at his office-home. He began practice in 1893.

* * *

The marriage of Miss Mary Kay Simon, of New Prague, and **Dr. Donald L. Alcott,** formerly of Watertown, South Dakota, took place at New Prague on January 7. The bride was a nurse at St. Mary's Hospital, Rochester. Dr. Alcott, a graduate of Rush University, is a fellow of the Mayo Foundation.

* * *

At the annual meeting of the **Waseca County Medical Society,** held in Janesville on January 11, Dr. R. D. Davis was elected president of the organization. Dr. S. C. G. Oeljen was named vice president, and Dr. William B. Gallagher, secretary-treasurer. All three are from Waseca.

* * *

Dr. Byron H. McLaughlin, who recently completed a three-year fellowship at the Mayo Clinic, Rochester, announces his association with Dr. Stanley R. Maxeiner at 1653 Medical Arts Building, Minneapolis.

* * *

Dr. Kendall B. Corbin, consultant in neurology in the Mayo Clinic and professor of neurosurgery in the Mayo Foundation, has been appointed associate director of the Foundation by the Board of Regents of the University of Minnesota, it was announced on January 13.

In his new post Dr. Corbin shares administrative luties with Dr. Victor Johnson, director of the Foundation.

Dr. Corbin became a member of the department of eurology and psychiatry at the Mayo Clinic in July, 1946. Before that he had been an instructor in natomy at Stanford University and professor of natomy at the University of Tennessee. He was lso chairman of the department of anatomy and upervisor of the department of clinical neurology. He received his medical degree at Stanford in 1935.

* * *

More than 2,000 students in the Edina-Morningside chool system received **eye examinations** in January hrough a survey sponsored by the Edina-Morningside Parent-Teachers Association. The survey was onducted by the Minnesota Society for the Prevenion of Blindness, with the endorsement of the Hennepin County Medical Society.

* * *

Principal speaker at a regional meeting of the Jniversity of Minnesota Alumni Association in Virinia on February 13 was **Dr. William G. Kubicek,** ssociate professor of medicine at the University of Minnesota. The meeting gave special recognition to he medical school and honored all physicians in the rea who were graduates of it.

* * *

Two addresses were made in Duluth on February by **Dr. Frank H. Krusen,** professor of physical medicine in the Mayo Foundation and head of the section on physical medicine at the Mayo Clinic. He spoke on "Rehabilitation of the Handicapped" at a meeting of the Duluth Association for the Physically Handicapped and at a meeting of the St. Louis County Medical Society.

* * *

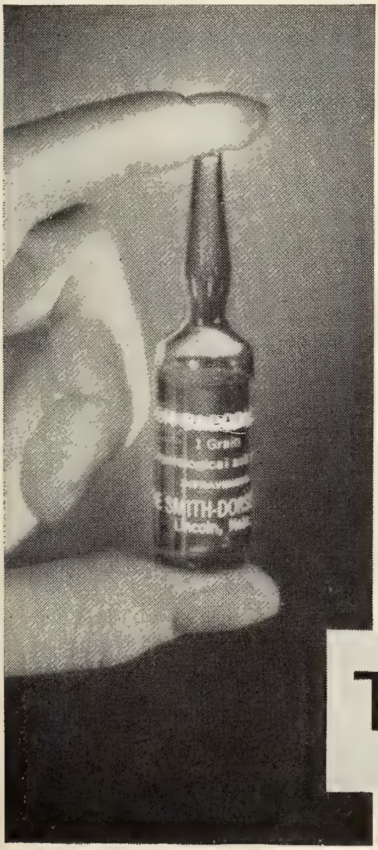
A dinner to honor **Dr. Ralph Rossen,** Minnesota's first mental health commissioner, was held at the Coffman Memorial Union on the University of Minnesota campus on February 2. Governor Luther W. Youngdahl presided at the dinner, which was attended by members of the medical profession, state officials, legislators, citizens groups that fought for the mental health program, and institutional and psychiatric workers concerned with the program. Dr. Ernest M. Hammes was chairman of the sponsoring committee of the affair.

* * *

Dr. Maurice B. Visscher, professor and head of the department of physiology at the University of Minnesota, has been elected to the board of directors of the National Society for Medical Research. The organization is currently emphasizing the importance of animal experimentation in medicine and has set as one of its goals improved methods for procurement and care of laboratory animals.

* * *

Aims and objectives of the **Hennepin County Medical Society** were explained by Thomas P. Cook,



What's Behind an Ampoule?

A FORMULA, a couple of machines and a label?
. . . That's about it—for *just any* ampoule.

But the careful physician won't settle for just
any product—ampoule or otherwise.
When he prescribes, he wants the label to
signify—beyond the shadow of a doubt—
a clean manufacturing record, preferably
one stretching back a generation or more;
unfailing adherence to controls;
a research program with adequate staff
and facilities; and for final confirmation, a
place on the roster of Council accepted products.

You need settle for nothing less when
you specify medication labeled

An Observation on the Accuracy of Digitalis Doses

Withering made this penetrating observation in his classic monograph on digitalis: "The more I saw of the great powers of this plant, the more it seemed necessary to bring the doses of it to the greatest possible accuracy."[1]

To achieve the greatest accuracy in dosage and at the same time to preserve the full activity of the leaf, the total cardioactive principles must be isolated from the plant in pure crystalline form so that doses can be based on the actual weight of the active constituents. This is, in fact, the method by which Digilanid® is made.

Digilanid contains all the *initial* glycosides from Digitalis lanata in crystalline form. It thus truly represents "the great powers of the plant" and brings "the doses of it to the greatest possible accuracy".

Clinical investigation has proved that Digilanid is "an effective cardioactive preparation, which has the advantages of purity, stability and accuracy as to dosage and therapeutic effect."[2]

Average dose for initiating treatment: 2 to 4 tablets of Digilanid daily until the desired therapeutic level is reached.
Average maintenance dose: 1 tablet daily.
Also available: Drops, Ampuls and Suppositories.

1. *Withering, W.:* An account of the Foxglove, London, 1785.
2. *Rimmerman, A. B.:* Digilanid and the Therapy of Congestive Heart Disease, Am. J. M. Sc. *209:* 33-41 (Jan.) 1945.

Literature giving further details about Digilanid and Physician's Trial Supply are available on request.

executive secretary of the organization, at a meeting of the Rotary Club in Excelsior late in January.

* * *

Dr. Victor W. Doman and **Dr. John T. Rose** are now occupying a newly constructed clinic building in Lakefield. The modern structure contains offices, a treatment room, an x-ray and minor surgery room, a laboratory and a business office.

* * *

Dr. Donald C. Balfour, director emeritus of the Mayo Foundation, received the Builder of the Name award of the University of Minnesota at ceremonies held on February 16. The award was established in 1947 and is given in recognition of service to the University. Only three other persons have received the award.

Dr. Balfour, who served as director of the Mayo Foundation from 1937 to 1947, first joined the staff of the Mayo Clinic in 1907. He was named head of a section in the division of surgery in 1912 and later became head of the division. He was appointed professor of surgery in the Mayo Foundation in 1923 and was named associate director in 1935.

* * *

Among Minnesota physicians attending a continuation course in cardiovascular diseases, held at the University of Minnesota Center for Continuation Study on January 5 through 7, were Dr. G. Ruggles, Forest Lake; Dr. R. E. Billings, Franklin; Dr. William A. Owens, Montevideo; Dr. C. L. Roholt, Waverly; Dr. C. A. Anderson, Hector; and Dr. F. M. McCarten and Dr. Henry Van Meier, both of Stillwater.

* * *

Plans for construction of a $12,000,000 **ten-story clinic building** were announced on January 5 by Dr. Arlie R. Barnes, chairman of the Mayo Clinic board of directors.

Site of the proposed structure will be the block across the street from the present clinic, where the Mayo Foundation medical museum now stands. The new building will more than double the floor space of the present clinic buildings. It will be planned to handle 150,000 to 160,000 patient registrations a year, and it will have the structural strength to allow an additional eight stories, if necessary. Construction cost, estimated to be $12,000,000, will be paid entirely by the Mayo Association, a non-stock "charitable, benevolent and educational" corporation established by the Mayo brothers in 1919.

It was expected that ground-breaking for the structure will take place this year, perhaps in August. Completion of construction is expected within four years.

* * *

At a meeting of the Winona County Public Health Nursing Advisory Committee in Winona on January 17, **Dr. Viktor O. Wilson,** acting district health officer for the Minnesota Department of Health, outlined a plan for a joint county-city health department, as permitted by 1949 state legislation.

* * *

A ham radio operator and a Minneapolis physician collaborated on January 5 to diagnose and prescribe treatment for a child on a ship in the Atlantic Ocean 1,500 miles away.

Fred Kaefer, a St. Louis Park amateur radio operator, picked up an emergency call from the captain of the Flying Enterprise, a trading vessel 400 miles off the coast of New Jersey. A six-year-old child passenger was very sick, the captain said. Kaefer telephoned Northwestern Hospital in Minneapolis, reached **Dr. Cherry Cedarleaf,** a resident pediatrician, and let her talk to the captain. The captain described the symptoms and signs; the physician diagnosed acute tonsilitis and prescribed appropriate treatment. Fifteen hundred miles away, the captain followed the broadcast instructions.

A few hours later, the child—a German on his way to the United States with his parents—was apparently well on the road to recovery . . . thanks to a triple play in communications: ship captain to radio operator to physician.

Dr. Burril Crohn, of Mt. Sinai Hospital, New York, will deliver the annual Phi Delta Epsilon Lecture at the Museum of Natural History on the University of Minnesota campus at 8:00 p.m., April 20. His subject will be "Regional Iléitis."

* * *

Duluth's longest practicing surgeon, **Dr. William R. Bagley** celebrated his eightieth birthday on January 15. A graduate of the University of Michigan Medical School, Dr. Bagley began his practice in Duluth in 1893, when he became associated with Dr. William H. Magie, a pioneer Duluth surgeon. By 1910 Dr. Bagley's strenuous night-and-day medical schedule had undermined his health so severely that he was forced to retire to Oregon for a long rest. After five years of unhurried ranch life, he returned to Duluth and his practice. Since then he has set aside a part of each year for a good vacation to reenforce his health.

A civic leader and an ardent supporter of conservation—he is an ex-state president of the Izaak Walton League—Dr. Bagley was chosen for Duluth's Hall of Fame in 1941, when the city paid tribute to him for his numerous contributions to state and city. Among his children are two physicians, Dr. Elizabeth C. Bagley and Dr. Charles W. Bagley, both Duluth practitioners, and the wife of a physician, Mrs. C. L. Oppegaard, of Crookston.

Dr. Abbott Skinner has opened an office at 714 Lowry Medical Arts Building, Saint Paul, for the practice of general surgery. Dr. Skinner was graduated from Harvard Medical School in 1942 and interned at Ancker Hospital, Saint Paul. After serving in the Army for three years, part of the time in the South Pacific, he took a residency in surgery at Ancker Hospital, which he has just completed. He received an M.S. degree in surgery at the University of Minnesota in June, 1949.

Dr. Joseph N. Gahlen and **Dr. Frank J. Milnar** announce their association for the practice of internal medicine, with offices at 714 Lowry Medical Arts Building, Saint Paul.

HOSPITAL NEWS

Following are the results of various hospital staff elections recently held in Minnesota.

St. Joseph's Hospital, Brainerd.—Dr. A. M. Mulligan, chief-of-staff; Dr. J. H. Bender, vice chief-of-staff; Dr. W. W. Anderson, secretary-treasurer.

Maternity Hospital, Minneapolis.—Dr. Ray F. Cochrane, president; Dr. Helen Haberer, secretary.

St. Andrews Hospital, Minneapolis.—Dr. Frank E. Mork, Anoka, chief-of-staff.

St. Mary's Hospital, Duluth.—Dr. K. R. Fawcett, chief-of-staff-elect; Dr. R. P. Buckley, chief-of-staff; Dr. A. C. Kelly, secretary.

St. Luke's Hospital, St. Paul.—Dr. Victor P. Hauser, chief-of-staff; Dr. C. W. Leverenz, secretary. Officers of the board of trustees: E. G. Carpenter, president; B. G. Griggs, first vice president; G. O. House, second vice president; William J. Gratz, secretary-treasurer. The hospital has been certified by the American College of Surgeons.

St. Barnabas Hospital, Minneapolis.—Dr. Arthur C. Kerkhof, chief-of-staff; Dr. L. A. Whitesell, vice chief-of-staff; Dr. Edgar A. Webb, secretary-treasurer. Executive committee: Dr. E. A. Arlander, Dr. C. M. Cabot, Dr. M. T. Mitchell, Dr. N. H. Lufkin, Dr. M. E. Knapp, Dr. A. V. Stoesser, Dr. C. W. del Plaine, Dr. E. J. Lillehei, Dr. W. E. Proffitt and Dr. H. H. Noran.

babies were born in the hospital and 1,351 patients were admitted for care. The hospital, which was opened by Dr. J. P. Nehring in 1944, has been operating to full capacity since its start.

* * *

At a meeting of the medical staff of **Maternity Hospital,** Minneapolis, on January 17, Dr. Milton Abramson reported that the hospital had established what was believed to be a record in 6,845 consecutive maternity cases without a maternal death. The record ran between April, 1940, and August, 1947. During the past thirteen years there were only three maternal deaths in 13,009 cases—a rate of .023 per 1,000. The national average maternal mortality is 1.3 deaths per 1,000.

* * *

Plans for the proposed hospital at **Madison** have been changed to include a penthouse addition to furnish living quarters for twelve nurses and a superintendent. The one-story hospital, when completed, will have a normal capacity of thirty and a full capacity of forty-two beds. Cost of the project is $450,000. Of this amount, residents of the Madison area were asked to raise $150,000. When contributions and pledges were counted after a fund-raising campaign, the total was $177,369.

* * *

At the annual meeting of the **Oakland Park Sanatorium** commission, Dr. O. F. Mellby of Thief River Falls was re-elected president. Dr. Mellby has held the office for the past thirty years. Dr. Baldwin Borreson, superintendent of the sanatorium, is secretary of the commission.

BLUE CROSS-BLUE SHIELD NEWS

With 260,500 persons enrolled, Minnesota Blue Shield is the thirteenth in size of the sixty-seven Blue Shield Plans in the nation. This increase in enrollment during 1949 amounts to more than two and a half times the enrollment in 1948, and placed Minnesota Blue Shield as fifth in size of increased enrollment during the first nine months of 1949.

Nearly 31,000 claims were paid by Minnesota Blue Shield during 1949. Of the total number of claims, over 29,000 were submitted by participating Blue Shield doctors, who received $1,076,513.31 in Blue Shield payments for care given subscribers. Total payments to doctors during the year amounted to more than $1,156,230. Throughout the United States and Canada, Blue Shield Plans will have paid approximately $100,000,000 during 1949 for medical care to their thirteen million subscribers.

Hospital care to Minnesota Blue Cross subscribers during 1949 totaled $8,746,831, or 94.4 per cent of the year's income. This is 7.9 per cent more of earned income than was paid to hospitals for care of subscribers in 1948. Operating expenses during 1949 amounted to 10.8 per cent of the year's income, and is a decrease

from 1948 when operating expenses came to 11.2 per cent of the total income for the year.

More persons using hospital care, increased usage of certain hospital services, and higher hospital costs were chief reasons for the increased utilization in 1949. Hospitalization of persons protected under family contracts was the highest in Blue Cross history, and hospitalization under single subscriber contracts was the highest its been in the last five years. Combined, the increased utilization under single and family contracts resulted in a rate of 417 cases paid per thousand Blue Cross contracts compared with 374 per thousand contracts paid in 1948.

Respiratory illnesses were the chief cause for hospitalization during 1949, accident cases ranked second and maternity cases third. This is the first time since 1940 that accident cases exceeded the number of maternity cases paid. The rate of increase, however, in both accident and maternity cases was not as great as the rate of increase in 1948.

With 966,483 persons enrolled, Minnesota Blue Cross continues to maintain its position as ninth largest Blue Cross Plan in the United States. Throughout the United States and Canada over thirty-five million persons are enrolled in Blue Cross, and about $300,000,000 has been paid for subscribers' hospital care during 1949.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

BRUCELLOSIS (Undulant Fever). Second Edition. Harold J. Harris, M.D., F.A.C.P.; with assistance of Blanche L. Stevenson, R.N. Foreword by Walter M. Simpson, M.S., M.D., F.A.C.P. 618 pages. Illus. Price $10.00, cloth. New York: Paul B. Hoeber, Inc., 1950.

MEDICAL MANAGEMENT OF GASTROINTESTINAL DISORDERS. Garnett Cheney, M.D. Clinical Professor of Medicine, Stanford University Medical School. 478 pages. Illus. Price $6.75, cloth. Chicago: The Year Book Publishers, Inc., 1950.

QUINIDINE IN DISORDERS OF THE HEART. Harry Gold, M.D. Professor of Clinical Pharmacology at Cornell Medical College; Attending Physician-in-Charge of the Cardiovascular Research Unit at the Beth Israel Hospital; Attending Cardiologists at the Hospital for Joint Diseases; Managing Editor of the Cornell Conferences on Therapy. 115 pages. Price $2.00, cloth. New York: Paul B. Hoeber, Inc., 1950.

PRIMER OF ALLERGY. Third Edition. Warren T. Vaughan, M.S., M.D. 175 pages. Illus. Price $3.50. St. Louis: C. V. Mosby Co., 1950.

CARDIOVASCULAR DISEASE—Fundamentals, Differential Diagnosis, Prognosis and Treatment. Louis H. Sigler, M.D., F.A.C.P. Attending Cardiologist and Chief of Cardiac Clinic, Coney Island Hospital; Consulting Cardiologist, Rockaway Beach Hospital; Consulting Cardiologist, Menorah Home and Hospital for the Aged. 551 pages. Illus. Price $10.00, cloth. New York: Grune & Stratton, 1949.

THE PHYSIOLOGY OF THOUGHT. A Functional Study of the Human Mind in Action. Harold Bailey, M.D., F.A.C.S. 313 pages. Price $3.75, cloth. New York: William-Frederick Press, New York, 1949.

X-RAY TREATMENT, ITS ORIGIN, BIRTH AND EARLY HISTORY. Emil H. Grubbé, B.S., M.D., F.A.C.P., Charter Member and Emeritus Member of the Radiological Society of North America; Charter Member of the American Roentgen Ray Society; Diplomate of the American Board of Radiology; Associate Fellow of the American Medical Association; Emeritus Member of the Illinois State Medical Society, and a Member of the Chicago Medical Society. 153 pages. Illus. Price $3.00. Saint Paul: The Bruce Publishing Co., 1949.

This is the professional autobiography of a living pioneer of radiology, whose professional life parallels the development of that science. The locale is Chicago, the historical aspects correct and the reading excellent. I was impressed by the author's scientific and physical tenacity, the latter evidenced by the fact that he personally has undergone some eighty-three operations as a result of x-ray burns. I feel that the book should be included in the libraries of all radiologists, of workers in the atomic field, and in medical libraries generally, not only because of the historical interest but because of the contemporary interest and current reawakening of the effects of radiation.

Leo A. Nash, M.D.

LIFE AMONG THE DOCTORS. Paul De Kruif in collaboration with Rhea De Kruif. 470 pages. Price $4.75. New York: Harcourt, Brace and Co., 1949.

Essentially this book deals with the activities of a number of medical men of the past few years. It is colored by the recurring thought that all of the individuals discussed are persecuted heroes. The men whom we recognize in the book do not need that particular type of patronage. A number of direct statements are made and a number of reports are given which should be challenged. Examples of poor literary taste are present

even to the point of the actual words used. It is unfortunate that the author, who has set himself up in the eyes of the reading public as an able medical and scientific reporter, has to resort to the brand of sensationalism which pervades. In spite of the publisher's note that the book has the deepest social implications of all of De Kruif's works, I doubt that any discerning reader will be moved very much by it, if for no other reason than that the tone is bitter, vindictive and generally low.

LEO A. NASH, M.D.

CONGENITAL ANOMALIES OF THE HEART AND GREAT VESSELS: Clinicopathologic Study of 132 Cases. Thomas J. Dry, M.D., of Mayo Clinic, Jesse E. Edwards, B.S., M.D., of Mayo Clinic, Robert L. Parker, M.S. in Medicine, M.D., F.A.C.P., of Mayo Clinic, Howard B. Burchell, M.D., Ph.D., in Medicine, of Mayo Clinic, H. Milton Rogers, B.S., M.S. in Medicine, M.D., Fellow in Medicine of Mayo Clinic, and Arthur H. Bulbulian, M.S., D.D.S., F.A.C.D. of Mayo Clinic. 68 pages. Illus., including color plates. Price $4.50. Springfield: Charles C Thomas, 1949.

This slender book is an atlas of anomalies of the heart and great vessels, based on a study of 132 clinicopathologic cases. The atlas is divided into sixteen sections, roughly corresponding to a classification of the pathologic anatomy of congenital heart disease. Each section is composed of two pages with the following illustrations:

1. A picture of the scientist who described the entity,
2. colored photographs of models of the heart based on autopsy material,
3. a black and white photograph of an autopsy specimen,
4. a pen and ink drawing clarifying the photograph,
5. the pertinent electrocardiograph, and
6. the chest film.

A biographical and historical note accompanies each scientist's picture.

The text is brief, pithy and interspersed among the illustrations in such a fashion that the illustrations yield a maximum of information with a minimum of study. The atlas is so well planned and illustrated that it does the job that would otherwise require hundreds of pages of dull text.

The atlas can be recommended to all physicians, especially those who seek an easy, painless method of understanding the recent advances in cardiac surgery by studying the pathologic anatomy.

COLEMAN J. CONNOLLY, M.D.

ERNIA DEL DISCO E SCIATICA VERTEBRALE. F. Delitala and A. Bonola. 213 pp. Price—2500 lire. Bologna: L. Cappelli, 1949.

This Italian monograph, published in 1949, contains 213 pages including an extensive bibliography on the intervertebral disk. There are 108 illustrations, many of which are excellent.

The authors consider "posterior intraspinal herniation of the disk" as a more exact term for the pathologic condition which has been variously called "protrusion," "dislocation," "luxation," "extrusion," and so forth of the intervertebral disk. They point out that the herniated material removed at the time of operation frequently is composed of fragments of the annulus.

Although the authors have observed only 200 cases of herniated intervertebral disk, they have made a careful study of the world's literature on the subject and have brought the subject up to date for the Italians who were shut off during World War II "from the great currents of scientific thought."

The authors have restricted the use of iodized oil for myelography because they fear an untoward reaction when the oil comes in contact with the nerve roots. They consider the neurologic examination as the basis of diagnosis.

They have abandoned the intradural method of removal of fibrocartilaginous fragments of disks because of the harm that such a procedure may cause.

The authors have had to reoperate on six patients. From those six experiences they feel that systematic surgical exploration of the space above, below and on he opposite side should be done in instances of pluriraliculitis because of the possibility of multiple herniation of a disk or disks. They also recommend vertebral arthrodesis or radicotomy when the situation is doubtful.

COMPARATIVE RÉSUMÉ OF RESULTS OBTAINED BY INTERVENTION FOR EXTIRPATION OF HERNIATED INTERVERTEBRAL DISKS

Results	Per cent				
	Best	Good	Moderately good	Mediocre	Bad
ove: 987 of 1,217 patients operated on from 1939 to 1941		53.7	36.7		9.6
andy: 843 cases	23.8	43.7		21.9	17.0
rand: 200 cases		63.0	29.0		8.0
ur own cases: Series 1; 78 of 100 patients operated on from 1934 to 1947	26.9	58.9	3.8		10.2
ur own cases: Series 2; 170 of 217 patients operated on from 1934 to 1948	34.1	31.7	25.2	7.6	1.1

The authors have compared their results of surgical reatment of herniated intervertebral disks with those f some American authors.

In the entire United States about 270,000 mental paients are coming back into the community each year. he spread of the disease from those who may have ontracted tuberculosis while in mental hospitals thereore becomes a community problem which we cannot fford to ignore.—*Public Health Reports*, January 7, 1949.

Minneapolis Man Arrested Third Time for Illegal Practices

Re State of Minnesota vs. Frank Herman Gold, also known as Frank H. Gould.

On January 24, 1950, Frank Herman Gold, also known as Frank H. Gould, 32 years of age, residing at 47½ Washington Avenue South, Minneapolis, was sentenced by the Hon. John A. Weeks, Judge of the District Court of Hennepin County, to a term of one year in the Minneapolis Workhouse. Gold had pleaded guilty on January 18, 1950, to an information charging him with the crime of practicing healing without a basic science certificate. Gold was arrested on January 14, 1950, during an investigation by the Minnesota State Board of Medical Examiners and the Minneapolis Police Department. At the time of his arrest Gold was representing himself as "Dr. Frank H. Gould." Gold had requested one of the Minneapolis drug stores to print some prescriptions for him and after receiving the prescriptions wrote several. The prescriptions were questioned by a pharmacist and this led to Gold's arrest.

Gold has never studied medicine but was employed for several years as an orderly at a hospital in New York City, and also worked in the same capacity for at least three hospitals in Minneapolis and St. Paul. Gold was first arrested on May 18, 1946, by Minneapolis Police officers for representing himself as a physician and surgeon. He pleaded guilty on May 21, 1946, and on June 12, 1946, was sentenced to a term of one year in the Minneapolis Workhouse. Because it was Gold's first conviction the sentence was stayed and the defendant placed on probation. In March, 1948, it was learned that Gold was again practicing healing illegally by representing himself as a doctor of medicine. On March 8, 1948, Gold pleaded guilty to the charge and was sentenced by Judge Levi M. Hall to one year in the Minneapolis Workhouse. Judge Hall required Gold to serve the entire sentence, less time off for good behavior. In December, 1949, there was evidence that Gold again was attempting to practice healing. The investigation made, resulted in his arrest for the third time. Gold was unable to give the Court any logical explanation for his unusual behavior in persisting in his attempt to practice medicine without any medical education or license.

Gold stated that he was born in New York City, June 16, 1917; that he graduated from the James Monroe High School in the Bronx, New York City. Gold further stated that he had been in Minneapolis for the past nine years, except for the time that he served in the United States Navy during World War II. Gold has in his possession, papers indicating that he served as a Pharmacist Mate Third Class.

ANNOUNCES CONTINUOUS COURSES

SURGERY—Intensive Course in Surgical Technic, two weeks, starting March 20, April 17, May 15.
Surgical Technic, Surgical Anatomy and Clinical Surgery, four weeks, starting March 6, April 3, May 1.
Basic Principles in General Surgery, two weeks, starting April 3.
Personal Course in General Surgery, two weeks, starting April 17.
Surgery of Colon and Rectum, one week, starting April 10, May 15.
Esophageal Surgery, one week, starting June 5.
Breast and Thyroid Surgery, one week, starting June 26.
Thoracic Surgery, one week, starting June 12.
Gallbladder Surgery, ten hours, starting April 24.
Fractures and Traumatic Surgery, two weeks, starting March 20, June 12.
GYNECOLOGY—Intensive Course, two weeks, starting March 20, April 17.
Vaginal Approach to Pelvic Surgery, one week, starting April 3.
OBSTETRICS—Intensive Course, two weeks, starting April 3, June 5.
PEDIATRICS—Intensive Course, two weeks, starting April 3.
Personal Course in Cerebral Palsy, two weeks, starting July 31.
Personal Course in Diagnosis and Treatment of Congenital Malformations of the Heart, two weeks, starting June 5.
MEDICINE—Intensive General Course, two weeks, starting April 24.
Electrocardiography and Heart Disease, two weeks, starting July 17.
Hematology, one week, starting May 8.
Gastro-Enterology, two weeks, starting May 15.
Liver and Biliary Diseases, one week, starting June 5.
Gastroscopy, two weeks, starting May 15, June 12.
DERMATOLOGY—Formal Course, two weeks, starting May 8. Informal Clinical Course every two weeks.
UROLOGY—Intensive Course, two weeks, starting April 17. Cystoscopy, ten day practical Course, every two weeks.

General, Intensive and Special Courses in all Branches of Medicine, Surgery and the Specialties.

Cereal story familiar to millions
PABLUM
PABENA
PRECOOKED OATMEAL
JIMMIE
JANIE

A story familiar to millions of mothers is the daily preparation of PABLUM* and PABENA* as the first solid foods for millions of infants.

Pablum is a *mixed cereal*—Pabena is *oatmeal*.

Both are precooked, vitamin and mineral enriched, and practically identical in nutritive values. They are palatable and readily digestible, and quickly prepared by simply mixing with milk or water, hot or cold.

Pablum and Pabena may be freely alternated to provide variety in taste for infants, or for children and adults requiring a bland, low residue diet. Both are prescribed by physicians everywhere, and are advertised to physicians only.

Flying Saucers?

You and I probably have not seen a flying saucer, nor have we had the opportunity to touch or feel its exterior smoothness. Most of us are not even aware of its importance if it does exist.

This is also directly true of Accident and Sickness insurance. The value and importance of income protection is not readily apparent unless you have had an occasion to use the policy. But just ask the man who's been through a protracted period of disability. He will settle that question for you and in a hurry.

The simple, but important, aspect is that you must buy this coverage BEFORE disability strikes. Simple? Yes, because your Society has already made available to you an outstanding contract.

AUREOMYCIN

HYDROCHLORIDE LEDERLE

in Coliform Infections

Aureomycin has been found to exert a dramatic effect in the treatment of *Escherichia coli* infections; including peritonitis, bacteremia, urinary infections, meningitis and brain abscess. The prognosis in many of these infections has in the past been guarded, but the advent of aureomycin renders prompt recovery more likely.

Aureo-
mycin

Aureomycin has also been found effective for the control of the following infections: African tick-bite fever, acute amebiasis, bacterial and virus-like infections of the eye, bacteroides septicemia, boutonneuse fever, acute brucellosis, Gram-positive infections (including those caused by streptococci, staphylococci, and pneumococci), Gram-negative infections (including those caused by the coli-aerogenes group), granuloma inguinale, *H. influenzae* infections, lymphogranuloma venereum, peritonitis, primary atypical pneumonia, psittacosis (parrot fever), Q fever, rickettsialpox, Rocky Mountain spotted fever, subacute bacterial endocarditis resistant to penicillin, tularemia and typhus.

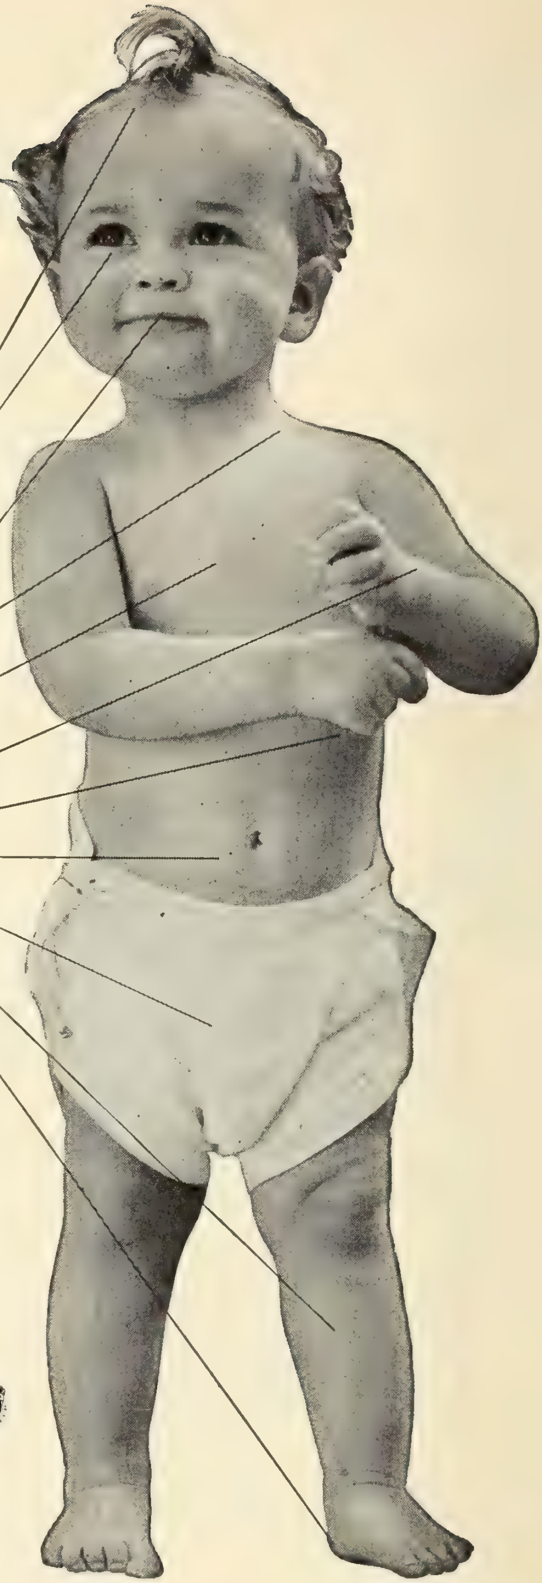
Capsules: Bottles of 25, 50 mg. each capsule.
Bottles of 16, 250 mg. each capsule.

Ophthalmic: Vials of 25 mg. with dropper; solution prepared by adding 5 cc. of distilled water.

LEDERLE LABORATORIES DIVISION AMERICAN Cyanamid COMPANY 30 Rockefeller Plaza, New York 20, N. Y.

from *head* to *toe*

CEREVIM-fed children showed greater clinical improvement, in the following nutrition-influenced categories, than children fed on ordinary unfortified cereal or no cereal at all:[1]



- hair lustre
- recession of corneal invasion
- retardation of cavities
- condition of gums
- condition of teeth
- skin color
- skeletal maturity
- skeletal mineralization
- *blood plasma vitamin A increase
- *blood plasma vitamin C increase
- subcutaneous tissues
- dermatologic state
- urinary riboflavin output
- musculature
- plantar contact

Here's why: CEREVIM is not just a cereal.

Much more: CEREVIM provides *8 natural foods:* whole wheat meal, oatmeal, milk protein, wheat germ, corn meal, barley, Brewers' dried yeast and malt – PLUS added *vitamins* and *minerals.*

CEREVim

CEREALS + VITAMINS + MINERALS

[1] "A Study of Enriched Cereal in Child Feeding" Urbach, C.; Mack, P. B., and Stokes, Jr., J: Pediatrics 1:70, 1948.

*Cerevim contains neither vitamin A nor C but possibly exercises an A-and-C sparing effect attributed to its high content of protein and major B vitamins.

Old at Forty

OR

YOUNG

AT

SIXTY?

CLINICAL observation and nutritional science agree that much depends upon the diet whether the individual will be biologically old at forty or biologically young at sixty.

To extend biologic youthfulness and vigor into later years, a good nutritional state based on an adequate diet is mandatory at all times. The efficient functioning of many physiologic processes is involved in maintaining good nutrition. On the other hand, only the adequate diet can sustain these processes. To assure such dietary adequacy under many conditions of physiologic stress encountered in day to day living, a properly organized food supplement often assumes vital importance.

The *multiple-nutrient dietary food supplement* Ovaltine in milk richly provides many nutritional essentials when such supplementation is indicated. It provides excellent amounts of vitamins A and D, ascorbic acid, niacin, riboflavin and thiamine; the important minerals calcium, iron and phosphorus; and biologically complete protein. Its satisfying flavor and its easy digestibility make it widely useful in both general and special diets whether for children, adults, or the aged.

The wealth of nutrients presented by three glassfuls of Ovaltine in milk is shown in the table below.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

OVALTINE
OVALTINE

Ovaltine

Three servings daily of Ovaltine, each made of ½ oz. of Ovaltine and 8 oz. of whole milk, provide:*

CALORIES	676	VITAMIN A	3000 I.U.
PROTEIN	32 Gm.	VITAMIN B_1	1.16 mg.
FAT	32 Gm.	RIBOFLAVIN	2.0 mg.
CARBOHYDRATE	65 Gm.	NIACIN	6.8 mg.
CALCIUM	1.12 Gm.	VITAMIN C	30.0 mg.
PHOSPHORUS	0.94 Gm.	VITAMIN D	417 I.U.
IRON	12 mg.	COPPER	0.5 mg.

*Based on average reported values for milk.

Two kinds, Plain and Chocolate Flavored. Serving for serving, they are virtually identical in nutritional content.

"Premarin"—a naturally occurring conjugated estrogen which has long been a choice of physicians treating the climacteric—is earning further clinical acclaim in the treatment of functional uterine bleeding.

The aim of estrogenic therapy in functional uterine bleeding is to bring about cessation of bleeding, and to produce subsequent regulation of the cycle. Once hemostasis is achieved, the maximum daily dosage of "Premarin" must be continued to prevent recurrence of bleeding. This schedule forms part of cyclic estrogen-progesterone treatment for attempted salvage of ovarian function.

While sodium estrone sulfate is the principal estrogen in "Premarin," other equine estrogens...estradiol, equilin, equilenin, hippulin...are probably also present in varying amounts as water-soluble conjugates.

An "estrogen of choice for hemostasis is 'Premarin' in tablets of 1.25 mg. ... The usual dose for hemostasis is 2 tablets three times a day. If bleeding has not decreased definitely by the third day of treatment the dosage level may be increased by 50 per cent."*

*Fry, C. O.: J. Am. M. Women's A. 4:51 (Feb.) 1949

"PREMARIN"®

Estrogenic Substances (water-soluble)
also known as Conjugated Estrogens (equine)

Four potencies of "Premarin" permit flexibility of dosage: 2.5 mg., 1.25 mg., 0.625 mg., and 0.3 mg. tablets; also in liquid form, 0.625 mg. in each 4 cc. (1 teaspoonful).

Ayerst, McKenna & Harrison Limited
22 East 40th Street, New York 16, N. Y.

5009

....YES! *Keleket's* new
Give you COMPLETE

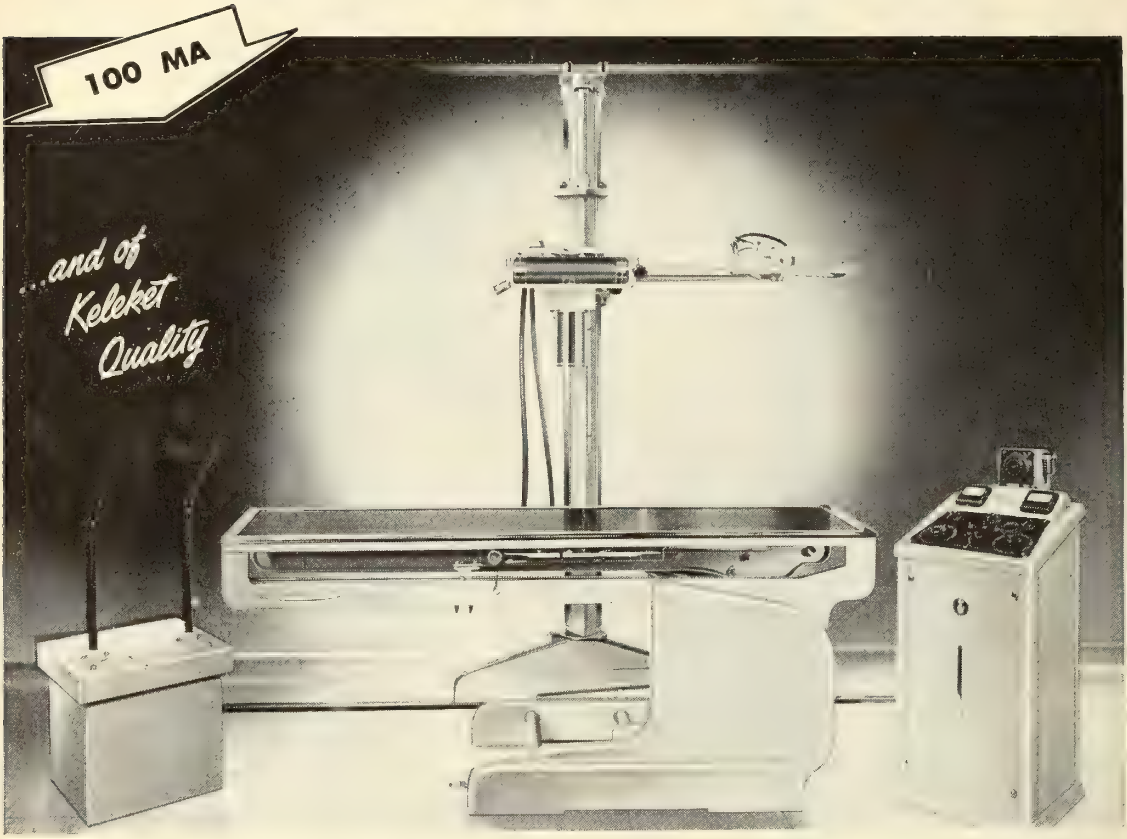

Illustration above shows 100 MA Combination with the basic table and Floor-To-Ceiling tubestand. This combination includes the famous Keleket Multicron Generator.

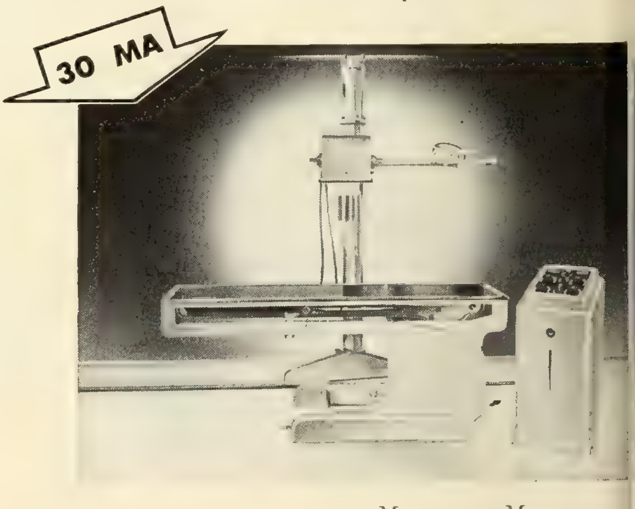
Illustration below shows 30 MA combination with the same basic table and Floor-To-Ceiling tubestand. This combination includes the 30 MA self-contained tubehead and precision control.

Here is how the Keleket Add-A-Unit Combinations Work

Choose the combination to suit your practice!

You purchase the new standard (not a reduced) size Keleket Tilt Table and Tubestand. Then add either 15, 30 or 100 MA tube and generating equipment. You can advance from 15 to 30 and to 100 MA but still retain the original table and tubestand. As a result, this investment is never lost when you step up to higher power tubes and generating equipment.



Add-a-Unit Combinations
X-RAY EQUIPMENT

. for FULL RANGE Fluoroscopy and Radiography

eleket scores again, with a new approach to the use and rchase of X-ray equipment. Keleket has developed a JLL SIZE Standard Tilting Table with a completely w, highly flexible floor to ceiling tubestand. This basic -ray equipment is equally adaptable for either 15, 30 100 MA tube and generating units.

ROWS WITH YOUR REQUIREMENTS

art out with the simplest 15 MA tubehead; then at a ture date change to a 30 MA tubehead, if you desire. henever you're ready, step up to a 100 MA generating it. As a result, your Keleket equipment grows with ur requirements.

HROUGHOUT ALL INTERCHANGES YOU RE- AIN THE SAME KELEKET "ADAP"-TABLE AND UBESTAND.

TURE COSTS SAVED

is means you eliminate one of the biggest cost factors in equipment—new table and tubestand costs as you step up your tube capacity and power.

In addition, your original investment is never lost—Keleket offers you generous allowance values on the equipment you interchange.

FULL RADIOGRAPHIC-FLUOROSCOPIC FACILITIES

Any of these combinations will fully meet your current needs for full range radiography and fluoroscopy. Perform radiography in horizontal and trendelenburg positions, vertical and horizontal fluoroscopy. The tubestand, for example, is so flexible that you can swing the tubehead away from the table and radiograph stretcher cases on the opposite side.

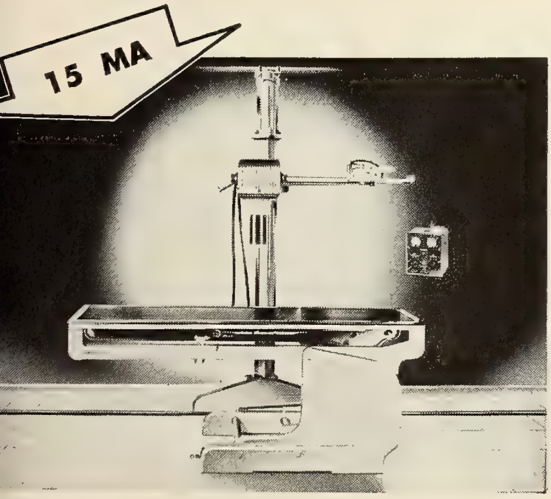
And if you want a bucky diaphragm, even the lowest cost unit is equipped to accommodate one.

Write of phone us for more information

Keleket X-Ray Sales Corporation of Minnesota

1111 Nicollet Avenue Minneapolis 3, Minnesota

ustration below shows same basic table and tubestand with new self-contained 15 MA tubehead and control.



A new approach to use and purchase of X-Ray equipment.

GENEROUS ALLOWANCE VALUES . . .
YOUR ORIGINAL INVESTMENT NEVER LOST.

Yes, with minimum cost you can obtain full radiographic-fluoroscopic facilities with Keleket Add-A-Unit Combinations—made possible for the first time with the new Keleket Flexible Floor-To-Ceiling Tubestand and Basic Tilt Table. Write for complete information.

SULFONAMIDES

as they like 'em

If the patient likes candy, he'll like the Duozine *Dulcet* Tablet. It's a pale orange cube the child can eat like candy, that tastes like candy all the way down—absolutely nothing about it to even remind the child of medicine. Yet, each tablet contains equal parts of sulfadiazine and sulfamerazine, as pure, stable and accurate as it is possible to compound. Indications and dosage are the same as for unflavored tablets. Duozine *Dulcet* Tablets are available in two sizes, the regular 0.3 Gm. and the half-size 0.15 Gm., through pharmacies everywhere in bottles of 100. For more complete information on Duozine and other sulfonamide *Dulcet* Tablets, write to Abbott Laboratories, North Chicago, Illinois.

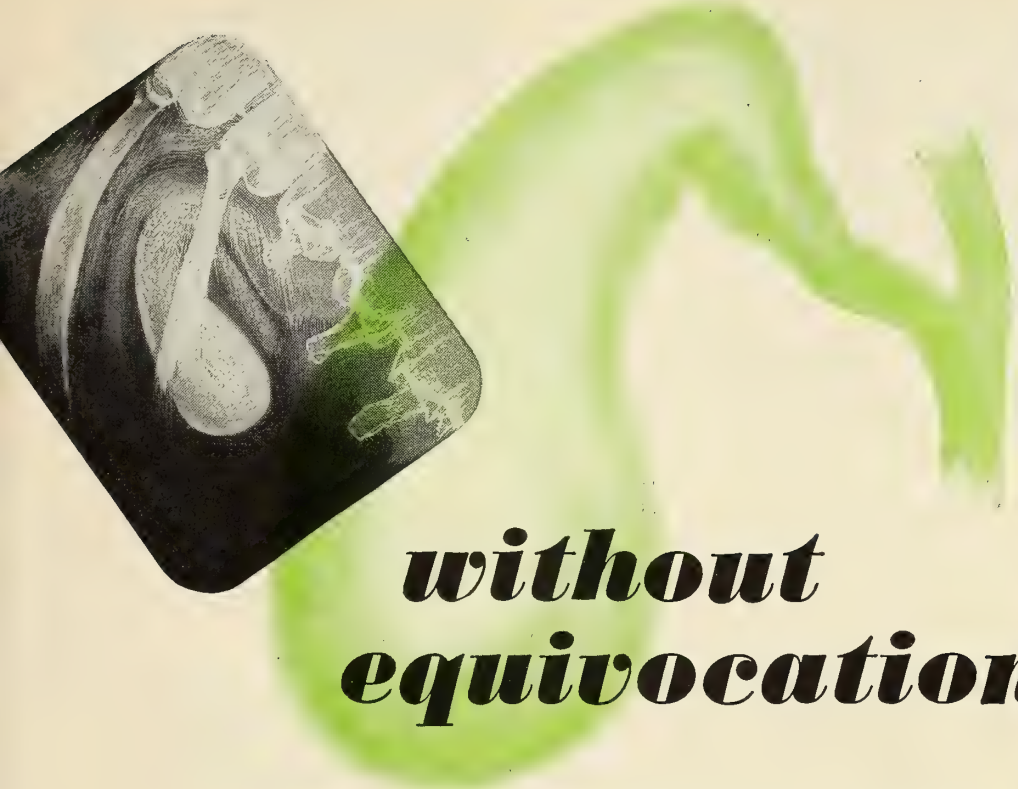
(Sulfadiazine-Sulfamerazine Combined, Abbott)

®Medicated Sugar Tablets, Abbott



without equivocation

In cholecystography, the "equivocal result" has virtually been eliminated. Cholecystograms made with Priodax® are a valuable aid to diagnosis. An unsatisfactory, equivocal roentgenogram is a disappointment to the physician and an annoyance to the patient requiring a repeat examination. "Non-visualization of the gallbladder after administration of Priodax is dependable evidence of organic gallbladder disease."[1] Formerly, such confusing factors as poor absorption, vomiting, diarrhea and residual contrast medium in the intestines hampered interpretation. Today, Priodax provides results with minimal interference from such factors.

PRIODAX

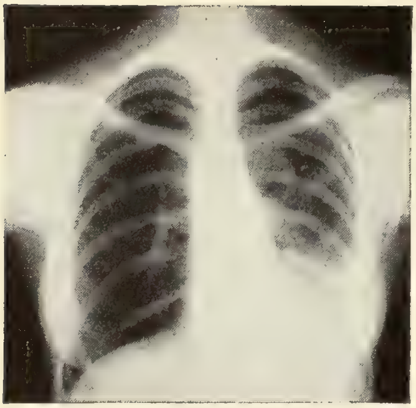
(iodoalphionic acid)

Priodax, beta-(4-hydroxy-3, 5-diiodophenyl)-alpha-phenyl-propionic acid, is available as 0.5 Gm. tablets in envelopes of six tablets and economy packages of 100 envelopes and in boxes of 1, 5 and 25 envelopes each bearing instructions for the patient. Also the Hospital Dispensing packages containing 4 rolls of 250 tablets each.

1. Brewer, A. A.: Radiology *48*:269, 1947.

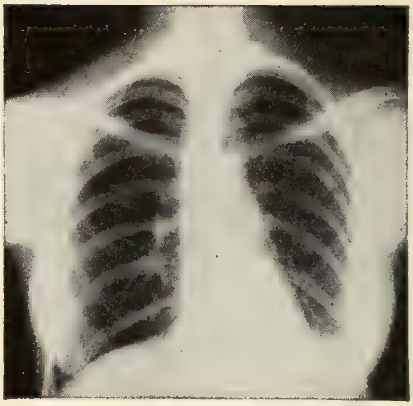
Schering **CORPORATION · BLOOMFIELD, NEW JERSEY**

PRIODAX



Before Treatment *(9 days prior to Dihydrostreptomycin therapy) Diffuse lobular tuberculous pneumonia, lower half of left lung; thin-walled cavity above hilus (3 x 3.5 cm.).*

After 3 Mos. Treatment *(2 days after discontinuance of Dihydrostreptomycin) Considerable clearing of acute exudative process in the diseased lung; cavity smaller and wall thinner.*



Preferred Adjuvants in the treatment of

TUBERCULOSIS

Dihydrostreptomycin and Streptomycin are unquestionably the most potent antibiotics now available for use against tuberculosis. Extensive clinical results have defined the important role of these antibiotics in suppressing the activity of the tubercle bacillus.

Detailed literature including indications, pharmacology, dosage, and administration is available upon request.

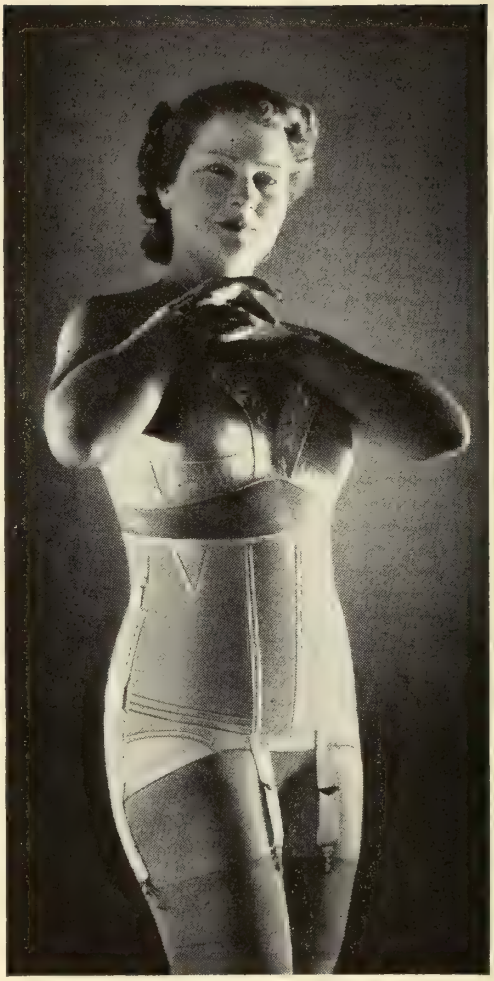
CAMP

for POSTOPERATIVE and POSTPARTUM NEEDS

Basic design and the unique system of adjustment make a large variety of Camp Scientific Supports especially useful as postoperative aids. Surgeons and physicians often prescribe them as assurance garments and consider them essential after operation upon obese persons, after repair of large herniae, or when wounds are draining or suppurating. A Camp Scientific Support is especially useful in the postoperative patient with undue relaxation of the abdominal wall. Obstetricians have long prescribed Camp Postoperative Supports for postpartum use. Physicians and surgeons may rely on the Camp-trained fitter for precise execution of all instructions.

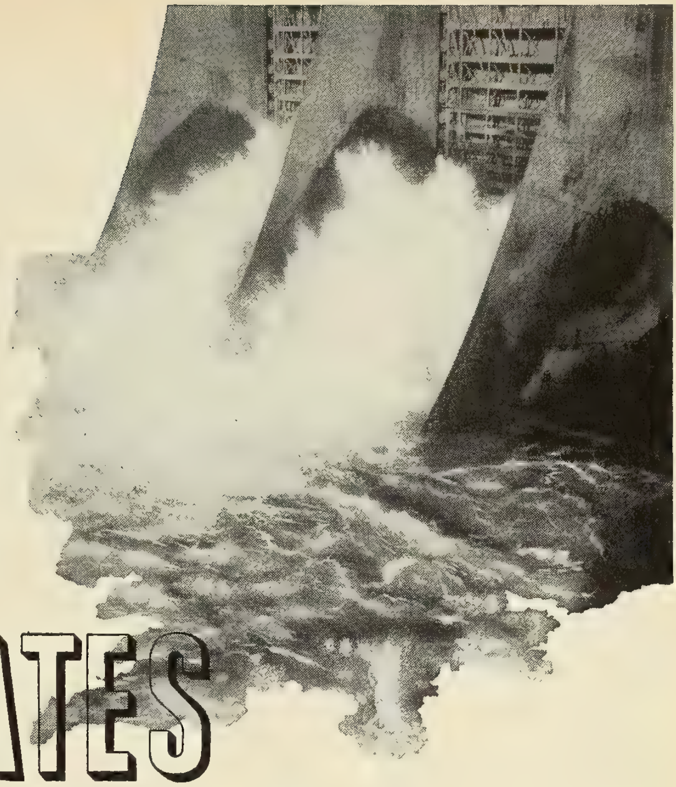
If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent on request.



Authorized Service
CAMP
Scientific Supports

THIS EMBLEM is displayed only by reliable merchants in your community. Camp Scientific Supports are never sold by door-to-door canvassers. Prices are based on intrinsic value. Regular technical and ethical training of Camp fitters insures precise and conscientious attention to your recommendations.

S. H. CAMP AND COMPANY, JACKSON, MICHIGAN
World's Largest Manufacturers of Scientific Supports
Offices in New York • Chicago • Windsor, Ontario • London, England



release the FLOOD GATES

in Cardiac Edema Control

". . . the diuretic drugs not only promote fluid loss but in many instances also effectively relieve dyspnea . . . not only may the load on the heart be decreased but there may also occur an increase in the organ's ability to carry its load . . . With good average response the patient perhaps voids about 2000 cc. of urine daily, but in exceptional instances the amount rises to as high as 8000 cc."[1]

"Not only are the diuretics of immense value in cases of left ventricular failure . . . but where edema is marked, as it is most likely to be in failures occurring in individuals with chronic nonvalvular disease with or without hypertension and arrhythmia, their employment is often productive of an excellent response. In [edematous patients with] active rheumatic carditis (rheumatic fever) the use of these drugs may be life-saving."[2]

Salyrgan-Theophylline is effective by muscle, vein or mouth.

Modernize Your Laboratory

Make your laboratory as efficient as your examining room. Equip it with a modern Hamilton laboratory bench designed for compactness, yet with space and accommodations for everything you need. Save valuable time and precious energy by concentrating all your laboratory equipment and materials in this one convenient unit.

The working surface is dark gray, unbreakable resisto, 13⅜″ x 65″. It has seven large wood-steel drawers, ranging from 3⅛″ to 7¾″ deep. The big cupboard provides ample storage space for bulky boxes and bottles. Chrome plated gas, air, electric and water service are located above the working surface. Above the cupboard unit is an acid-resisting porcelain enameled sink. See this "One-Piece" laboratory on our display floor or write for our descriptive Hamilton Laboratory Bench Catalog M-450.

STUDIES ON BRUCELLOSIS IN MINNESOTA

WESLEY W. SPINK, M.D.
Minneapolis, Minnesota

BRUCELLOSIS is an endemic disease of livestock, especially cattle, swine and goats. In Minnesota, it is the most common infection of animals transmitted to man. The disease derives its name from Sir David Bruce,[6] a British Army surgeon, who first identified the causative microbes toward the end of the last century on the Island of Malta. The human disease has also been designated as Malta fever and undulant fever.

In an area like Minnesota, this infection not only is of serious concern to the health of the people, but the disease is costly to the livestock and dairy industries. It is estimated that 4 to 5 per cent of the cattle in the state have brucellosis, and that 2 to 3 per cent of the hogs are infected. Brucellosis is one of the most common causes of abortion in cattle and in swine. Wherever this disease occurs in livestock, the reproduction of animals is decreased. In cattle, the infection also localizes in the udder so that milk production is reduced. With 20 per cent of the annual cash income of the farmers in Minnesota derived from butter, it can be readily seen why brucellosis is of importance in the economy of the state. It has been calculated on a national level that brucellosis costs the cattle industry around $100,000,000, annually.

It is difficult to estimate the number of human cases of brucellosis occurring in Minnesota because the disease can be insidious in its symptomatology, difficult to diagnose, and many mildly ill patients do not seek the advice of a physician. The number of recognized cases since the end of World War II has increased. Recent studies carried on at the University Hospitals indicate that in the rural population up to one-fourth of the people have been infected at some time in their lives.[25]

The problem of brucellosis has not remained unrecognized in Minnesota. Many studies have been pioneered in this area. Investigations on the control of the disease in cattle and in swine have occupied the attention of a group in the Division of Veterinary Medicine in the School of Agriculture at the University of Minnesota, first, under the direction of the late Dr. C. P. Fitch, and now under Dr. W. A. Boyd. Participating in these efforts has been the Minnesota Livestock Sanitary Board under the leadership of Dr. R. L. West. Recognition was also given to the human aspects of brucellosis as long ago as 1913 when the late Dr. W. P. Larsen, Professor of Bacteriology at the University of Minnesota, and Dr. J. P. Sedgwick,[14] former Professor of Pediatrics, reported evidence of the disease in the blood of infants, although the first proved human case of brucellosis was not established in Minnesota until 1927. The Minnesota State Department of Health, especially the Sections of Medical Laboratories and Preventable Diseases, has long been interested in attempts to recognize and prevent brucellosis in human beings.

From the Department of Medicine, University of Minnesota Hospitals and Medical School, Minneapolis.

Presented, in part, as a Sigma Xi Lecture, University of Minnesota, February 23, 1950.

Investigations on brucellosis were supported by research grants from the Division of Research Grants and Fellowships of the National Institute of Health, United States Public Health Service; Lederle Laboratories; the Graduate School, University of Minnesota; Committee on Scientific Research, American Medical Association.

Against this rich background of traditional interest in brucellosis in Minnesota, investigations on human brucellosis were initiated in the Department of Medicine at the University Hospitals in 1937. These studies had their origin at the bedside of patients ill with suspected brucellosis. It soon became apparent that the disease was difficult to recognize and to diagnose correctly, and that specific treatment was lacking. Some of the observations that have been made will be summarized at this time. Certain outstanding features of the disease have commanded interest. First, have been investigations on the epidemiology of brucellosis, or the manner in which patients acquired the infection. Second, has been a study of the natural history of the illness in patients seen at the University Hospitals. In addition, various tissues have been examined in an effort to ascertain what reactions occur as a result of invasion of the body by the microorganisms. Such an inquiry has been directed not only to human patients, but to experimentally infected animals, where the reactions have been more precisely defined. Third, a critical analysis has been made of the diagnostic methods employed for recogizing human brucellosis. Fourth, has been an evaluation of specific therapy for human brucellosis, the results of which have yielded quite encouraging results to date.

Epidemiology of Brucellosis in Minnesota

There are three species of Brucella that cause disease in livestock and in human beings. The most invasive species is *Brucella melitensis,* which originally had the goat as its reservoir. Recent observations in Iowa have shown that *Br. melitensis* also infects hogs under natural conditions.[13] A serious aspect of this finding is that an increasing number of human infections caused by *Br. melitensis* are being encountered in Iowa and in Minnesota. These cases due to *Br. melitensis* result from direct contact with infected swine, or their tissues. In Minnesota, practically all human illness due to *Br. melitensis* occurs in the southern part of the state, particularly in the counties adjacent to the Iowa border.[16] The next most invasive species is *Brucella suis,* which has as its normal habitat the tissues of swine. Strains of *Br. suis* have invaded and localized in the udders of cattle, and human epidemics of brucellosis have been caused by the ingestion of unpasteurized cow's milk containing this species of brucella.[2,3,12] In recent years, fewer and fewer cases of human brucellosis in Minnesota have been caused by *Br. suis.* The least invasive species is *Brucella abortus* with cattle as its natural reservoir. While in general, *Br. abortus* causes a less severe disease than that due to *Br. melitensis* or *Br. suis,* nevertheless, a protracted and grave illness can be induced by *Br. abortus,* in which serious and even fatal complications can occur. In a collaborative study carried out between the Department of Medicine at the University Hospitals and the Laboratories and Section of Preventable Disease of the Minnesota State Department of Health, the etiology of 268 bacteriologically proved cases of brucellosis occurring in Minnesota between January 1, 1945, and June 30, 1948[16] was determined as follows:

Species	*No. Cases*	*Per cent*
Brucella abortus	230	85.8
Brucella melitensis	22	8.2
Brucella suis	16	6.0

It is quite apparent that the great majority of human infections in Minnesota are due to *Br. abortus.*

Brucellosis is very rarely transmitted from human to human. The disease in Minnesota is acquired through direct contact with infected animals or their tissues or secretions, and by ingesting contaminated, unpasteurized milk or cream. The microorganisms enter small abrasions of the skin quite readily. Although there is experimental evidence indicating that brucellosis may be acquired through the respiratory tract following the inhalation of dust which contains viable organisms, there is still no clear-cut proof that this occurs under natural conditions.

In the collaborative epidemiologic study already referred to, it was found that about three-fourths of all proved cases of brucellosis occurred in males, and that three-fourths of these cases were in the third, fourth or fifth decade of life. There is no doubt that recognizable brucellosis in children under twelve years of age occurs much less frequently than in adults. Children appear to be more resistant to the infection. This study also revealed that approximately 75 per cent of all the cases of brucellosis in Minnesota resulted from direct contact with infected animals, or their tissues and secretions, while about 25 per cent were due to drinking unpasteurized milk. It should be emphasized that in whole milk, Brucellae appear in larger numbers in the cream fraction, and that the disease is quite readily contracted by ingesting fresh cream in one form or another. This Minnesota study has emphasized quite clearly that at least 60 per cent of the cases were occupational in origin involving farmers as the largest single group, followed by meat-packing plant employes.

In summary, human brucellosis in Minnesota is due primarily to *Br. abortus* with three-fourths of the cases occurring in males. Approximately 75 per cent of the cases are caused by contact, and 25 per cent are due to the ingestion of unpasteurized milk. At least 60 per cent of the cases are occupational in origin with farmers constituting the largest single group, followed by meat-packing plant employes.

Natural History of Human Brucellosis

There is no question that a clinical description of brucellosis will depend upon the status of the population infected, and the species of brucella causing the disease. Thus, the over-all picture in a well nourished people infected with *Br. abortus* in Minnesota differs from that seen in undernourished Mexican Indians infected by *Br. melitensis,* and who are frequently suffering from other parasitic invasion. Acute brucellosis caused by *Br. abortus* is characterized by weakness, chilly sensations and fever, sweats, bodily aches and pain, headache and backache. Physical abnormalities may be absent in many cases, but when present include splenomegaly, and cervical and axillary lymphadenopathy. In general, the duration of the illness is less than 6 months, and many cases terminate in a state of well-being within a few weeks. Not infrequently, the acute phase of the illness is so mild the cause of the illness may be unrecognized. Acute brucellosis is most frequently misdiagnosed by being called "influenza" or an "unknown virus disease." In an occasional case, a mild but acute illness may be succeeded by a persistent state of ill health featured by a continual feeling of weakness, low-grade fever, mental and physical inertia, vague aches and pains, and mental depression. From time to time these smoldering cases of brucellosis are diagnosed as instances of psychoneurosis, neurasthenia or an anxiety state. Only 10 to 15 per cent of the cases in the Minnesota study fall into this category of chronic brucellosis, or an illness enduring for more than one year. It has been observed in a large number of patients having either psychoneurosis or an anxiety state that many have been misdiagnosed as having chronic brucellosis on the basis of inadequate information, such as a positive skin test following the injection of brucella antigen. In an occasional patient, acute brucellosis may be followed by a post-infectious state of neurasthenia. But this is not specific for brucellosis, and occurs in other infectious diseases. The majority of cases of culturally proved chronic brucellosis studied at the University Hospitals whose illness extended beyond one year have been associated with demonstrable complications such as spondylitis, encephalomeningitis and endocarditis.[24,29,30] Brucellosis does not cause human abortions any more frequently than other bacterial infections. Orchitis in the human is more frequently associated with infection due to *Br. melitensis* than to *Br. abortus.* Likewise, neurological complications, such as severe sciatica, are encountered much more often in patients with illness due to *Br. melitensis.*

A study of the tissue reactions induced by brucella in human patients and in experimentally infected animals, has yielded very helpful information in an understanding of the natural history of the disease. Brucellae localize principally in the reticuloendothelial system. A characteristic granulomatous type of lesion free of suppuration or caseation has been demonstrated repeatedly in sections of sternal bone marrow and liver obtained by biopsy techniques.[28,32] These lesions are similar to those encountered in sarcoidosis, tuberculosis and syphilis. The nonsuppurating tubercles of brucellosis induced by *Br. abortus* have been interpreted in experimentally infected animals to represent a good defense mechanism and invasion of the tissues by microorganisms that are only mildly virulent. In contrast, strains of *Br. suis* frequently cause destruction of tissues with suppuration. *Br. melitensis* induces a severe state of toxemia and a chronic state of debility, but less suppuration than that caused by *Br. suis.*

The death rate from brucellosis is low. In the series at the University Hospital three patients have died, all deaths being due to subacute bacterial endocarditis and caused by *Br. abortus.* This is a mortality rate of about 3 per cent of all culturally proved cases.

The Diagnosis of Brucellosis

A history of exposure to the disease and an otherwise undefined febrile illness permit only a presumptive diagnosis of brucellosis. A precise diagnosis depends upon laboratory data. The total leukocyte count is either normal or reduced, and very rarely above 10,000 cells per cubic millimeter. A relative lymphocytosis is usually present. The erythrocyte sedimentation rate may be normal or accelerated, and is of no diagnostic value.[1] The most reliable method for screening suspected cases is by means of the agglutination test, which is carried out on request by the Laboratories of the Minnesota Department of Health. During the past twelve years, not a single case of bacteriologically proved brucellosis has been seen at the University Hospitals in which agglutinins have been absent from the blood. The agglutinin titer is usually 1 to 160 or above. In fact, over 90 per cent of the culturally proved cases have had a titer of 1 to 320 or more. It is most unusual to encounter a titer of 1 to 80 or less in a specimen of blood from which brucellae are recovered. A significant segment of the healthy population of Minnesota have a low titer of brucella agglutinins. In a recent study of over 1,627 healthy donors appearing at the blood bank of the University Hospitals, it was found that 18.54 per cent had brucella agglutinins in a titer up to 1 to 80. Less than 2 per cent had a titer of 1 to 160 or more, and in many of these individuals a history of exposure to the disease was elicited.[22]

If repeated examinations of the blood in a suspected case of brucellosis reveal the absence of agglutinins, it is highly unlikely that the patient has the disease. In the absence of postive blood cultures, too much dependence cannot be attached to titers that are consistently below 1 to 160. At least one culture of blood for brucella should be made in a patient suspected of having the disease, and such a culture should be carried out in every case when the agglutinin titer is 1 to 160 and above. Appropriate culture flasks may be obtained from the Minnesota Department of Health. At the University Hospitals, organisms have been recovered from the blood in about 25 per cent of the cases having active disease.

A positive intradermal test with brucella antigen denotes a state of hypersensitivity due to invasion of the tissues by the organisms at some time in the past. A positive skin test does not mean the presence of active disease. Since a survey at the University Hospitals revealed that approximately 20 per cent of a predominantly rural group of individuals had positive skin tests without other evidence of the disease, the skin test as a diagnostic procedure has been abandoned.[25] A positive skin test in a suspected case of brucellosis having either low titer of agglutinins or absent agglutinins is more confusing than enlightening. The opsonocytophagic test, which is a quantitative determination of phagocytosis of viable brucella by the polymorphonuclear leukocytes, has not yielded enough reliable information as a diagnostic procedure. Its use is not recommended.

The Treatment of Brucellosis

Considerable advancements have been made in the last few years in the specific therapy of brucellosis. While many patients with acute brucellosis may recover from the disease spontaneously, there are a significant number of patients whose illnesses pursue a more chronic course, often with debilitating and painful complications. Therefore, an extensive research program has been directed toward an evaluation of many agents, which might abruptly terminate the illness when administered to patients. These investigations have called for the screening of a large number of drugs in the laboratory and in experimentally infected animals.[5,10,15,18,19,34] The studies began in 1937, the year in which sulfanilamide became available for the treatment of bacterial infections. Because sulfanilamide, and some of the derivatives of sulfanilamide, such as sulfapyridine, sulfathiazole, sulfadiazine, and sulfamerazine, yielded encouraging results in the laboratory, patients were treated with these agents. While there was no question that in a few patients with acute brucellosis, therapy with one of the sulfonamides coincided with prompt recovery, the over-all results made it quite clear that the sulfonamides were not the answer to specific therapy.

A series of experimental and clinical studies were then undertaken with the antibiotics. Penicillin was soon found to be ineffective. Much more promising results were obtained experimentally with streptomycin, but when the drug was administered to acutely ill patients, the course of the disease was not significantly altered. This inconsistency between a good antibrucella effect of streptomycin under laboratory conditions and the poor results obtained in human beings has not been adequately explained. By a set of fortuitous circumstances, it was observed in a patient critically ill with brucellosis that the simultaneous administration of streptomycin and sulfadiazine caused a decided improvement. The advantage of this combination was soon confirmed in several more patients.[20,21,26,27] The most dramatic effect of this combined treatment was in a patient with a highly fatal complication of brucellosis, that of subacute bacterial endocarditis due to *Br. abortus.* This patient recovered following treatment, and has remained well for almost three years. Other workers have also reported on the success of the combination of streptomycin and sulfadiazine in culturally proved acute and chronic brucellosis.[9,17] One of the best controlled studies is that of Herrell and Nichols[11] of the Mayo Clinic, who treated 14 patients with excellent results.

Although the combination of streptomycin and sulfadiazine provided a definite advancement in the therapy of human brucellosis, this treatment also offered certain disadvantages. Prominent among the undesirable effects was the toxicity of streptomycin, which was reflected in vestibular dysfunction. In addition, some of the patients had a relapse after the completion of treatment. Streptomycin also had to be injected intramuscularly. A more desirable therapeutic approach would be with an agent or agents that could be administered by mouth; that would be less toxic; and that would be just as efficient, if not more so. It was just at this stage of experience at the University Hospitals that aureomycin appeared. This was a relatively nontoxic antibiotic that could be given by mouth. Preliminary experiments with this new antibiotic indicated that aureomycin was not as effective against brucella as the combination of streptomycin and sulfadiazine.[15] Accordingly, a therapeutic trial with aureomycin in human brucellosis was not seriously anticipated until a most unusual opportunity for evaluation presented itself. Through an invitation by the Government of Mexico, a co-operative study on the therapy of brucellosis was carried on at the General Hospital in Mexico City with Dr. M. Ruiz-Castaneda, who was in charge of brucellosis control in that country. Following the use of aureomycin by mouth in critically ill patients, the results were unexpectedly most dramatic.[23] Patients who had relapsed following the use of streptomycin and sulfadiazine, and some who were not expected to live, recovered promptly after receiving aureomycin. These results were subsequently confirmed in the treatment of patients in Minneapolis.[4] More recently there appeared in the British literature the significant paper of Dr. J. E. DeBono, Professor of Medicine in the Royal University of Malta.[8] He stated, "after a long and disappointing experience in the treatment of undulant fever one cannot help being somewhat cautious in expressing one's opionion. Notwithstanding this, the results have been so constant, so rapid, and even dramatic that it is impossible to deny that aureomycin has a specific action on *Brucella melitensis* in vivo." Bryer and his associates[7] of Baltimore also look upon aureomycin with favor in the treatment of brucellosis. Almost two years have elapsed since aureomycin was introduced into the treatment of brucellosis at the University Hospitals. This has permitted a follow-up of patients treated with the drug. Over 90 per cent of the patients have remained well following treatment. The recommended dose is now 20 to 30 mgs. per kg. of body weight per day, administered in three or four divided doses for two weeks. A maximum daily intake in an adult should be 2 gm., given in a dose of 0.5 gm. four times a day for two weeks. It has not been found necessary thus far to give aureomycin in combination with another antibiotic. A few patients who have relapsed have recovered following a second course of therapy.

Another antibiotic introduced for the treatment of brucellosis has been chloromycetin. This drug too can be administered orally and does not produce serious toxic reactions. There is no doubt that chloromycetin is effective in some cases of brucellosis.[33] Experience with chloromycetin in brucellosis at the University Hospitals has been limited, but it appears to be less effective than aureomycin.

There should remain no doubt that specific therapy is now available for the treatment of human brucellosis. Prompt treatment of acute cases not only hastens recovery, but also prevents devastating and serious complications.

Some Urgent Problems in Brucellosis Requiring Resolution

While many advancements have been made in our knowledge of brucellosis, much work and research remain to be done. Of paramount importance is the eradication of the natural reservoir of this disease. Brucellosis will not cease to be a threat to human health as long as there are infected cattle, hogs and goats. It is now generally agreed among authorities that brucellosis can only be wiped out in livestock by eliminating the infected animals and by protecting susceptible animals. In cattle this has called for a program of test and slaughter in heavily infected areas, and the immunization of calves with living, but avirulent brucella. Excellent progress along these lines has been made in Minnesota. There are many areas, especially in the northern part of the state, that are free from the disease. But a more persistent and aggressive effort is needed in some other areas. The very difficult problem of control of swine brucellosis requires further study. Brucellosis in hogs is not so readily diagnosed as in cattle. Because brucellosis is highly contagious in livestock it is readily seen why an eradication program must be a co-operative effort on an area or county basis. It is not enough that a few determined farmers and livestock producers should fight this disease. Because of the economic loss that is entailed it takes courage and vision to slaughter or eliminate highly prized, but infected, animals from a herd. Leadership and an educational program are essential in spearheading an effort of eradication. Physicians practicing in rural areas may greatly encourage this program by becoming acquainted with the status of the animal disease in their areas, and then lending their support to the local efforts by citing the danger of brucellosis to public health. Finally, brucellosis can only be completely stamped out in animals, and the constant threat of infection eliminated, by a nation-wide campaign of eradication. It is encouraging to see the progress that has been made along these lines during the past few years.

One of the most urgent problems in the field of human brucellosis is a more scientific clarification of what is meant by chronic brucellosis. During the past decade or two, some individuals have crystallized attention on the chronicity of the disease to such an extent that the diagnosis is frequently being made on the basis of flimsy and uncritical data. The widespread use of the skin test in diagnosing active disease has been most devastating in rupturing scientific inquiry into the nature of chronic brucellosis. A positive skin test and the symptoms of neurasthenia are all that many physicians require for an absolute diagnosis of chronic disease. It reflects a serious state of unscientific approach to problems in psychosomatic medicine. It is as though the phthisiologist were to diagnose *and treat* active tuberculosis on the basis of a positive tuberculin test and a vague symptomatology, without any objective evidence of localization of the disease. In an attempt to define more accurately the nature of chronic brucellosis a collaborative study has been instituted between the Department of Medicine at the University of Minnesota Hospitals and the section of Preventable Diseases of the Minnesota Department of Health. Careful follow-up clinical and laboratory studies are being made on a large group of patients with *bacteriologic proved* brucellosis. This investigation is being conducted with the aid of physicians throughout the state, whose willingness to co-operate in the effort has been most gratifying. It is only on the basis of a much needed study such as this that the frequency and nature of chronic brucellosis can be deliniated.

Acknowledgment

In the prosecution of these studies I am indebted to many individuals, especially to Dr. W. H. Hall, Dr. A. I. Braude, Dr. R. Magoffin, Dr. J. M. Shaffer, Dr. E. Yow, and Dr. B. Waisbren, and to Dorothy Anderson for valuable technical assistance.

SOME RECENT ASPECTS OF CARDIAC AND JUXTA-CARDIAC SURGERY

I. D. BARONOFSKY, M.D.
Saint Paul, Minnesota

SOME of the most notable advances during the last decade have been made in surgery of the heart and great vessels. It is not surprising that this should be so, as it has become possible to perform extensive operations because of the enormous amount of detailed study and experiment which has been devoted to answering the question of why patients die after operations from causes other than hemorrhages. One of the major trends in the past twenty-five years of American surgery is the emphasis on training in physiology in the long-term preparation of the young surgeon. Most advances in thoracic and vascular surgery have been made by physiologically minded surgeons.

It is our intention at this time to review briefly some of the studies made in cardiac and juxtacardiac surgery. The following classification is not intended to be a diagnostic chart, but merely a group listing of the diseases that have been or are being attacked in the human or in the experimental animal. It must be understood that this review can only be a small part of the work that is probably going on in laboratories or hospitals all over the world and has not as yet been reported.

Surgery of Heart and Great Vessels

I. Congenital Abnormalities
  A. Malformations which permit the body to receive an oxygen supply sufficient for the growth of the individual.
    1. Patent ductus arteriosus
    2. Defects in the auricular septum
    3. Defects in the ventricular septum
    4. Anomalies of the aortic arch
    5. Coarctation of the aorta
    6. Anomalies of the aortic valve and the ascending aorta.
  B. Malformations which deprive the body of an adequate amount of oxygenated blood.
    1. The tetralogy of Fallot
    2. Defective development of the right ventricle and tricuspid atresia
    3. Pure pulmonary stenosis
    4. Complete transposition of the great vessels and the common associated anomalies
    5. Anomalies of the venous return
  C. Defects of pericardium

II. Acquired abnormalities
  A. Sequelae of rheumatic heart disease
    1. Mitral stenosis
      (a) Valvulotomy
      (b) Commissurotomy
      (c) Interatrial septal defect
      (d) Pulmonary vein to azygos vein anastomosis
      (e) Sympathectomy
      (f) Ligation of auricular appendage
  B. Coronary heart disease
    1. Sympathectomy for anginal pain
    2. Pericoronary neurectomy
    3. Coronary sinus ligation
    4. Revascularization of the heart by graft from aorta to coronary sinus
    5. Anastomosis between the arterial bed of lung grafted upon the heart and the coronary arteries
    6. Excision of cardiac infarcts
  C. Constrictive pericarditis

III. Pump oxygenators

Congenital Abnormalities

Malformations Which Permit the Body to Receive an Oxygen Supply Sufficient for the Growth of the Individual

Patent Ductus Arteriosus.—It is fitting to begin the discussion of surgery of the congenital malformations by first discussing briefly the patent ductus arteriosus. Gross[19] in 1938 performed the first successful ligations of the ductus. Attempts had been made previous to this, but without success. In 1939 he reported his first successful case, and since that time great strides in the field of vascular surgery have been made. Certainly all due credit belongs to Dr. Gross in being the pioneer of congenital heart surgery.

Normally the communication present *in utero* between the pulmonary artery and the aorta, known as the ductus arteriosus, becomes closed off soon after birth. In some individuals this obligation may be delayed for weeks, for months, or even longer. Christie[12] found, from a study of routine autopsies, that the ductus was obliterated in 95 per cent of subjects by the end of the twelfth week, and in 99 per cent by the end of the first year. The exact mechanism of closure is debatable. However, it must be noted that a patent

---

From the Department of Surgery, University of Minnesota, and the Ancker Hospital, Saint Paul.
Presented at the Medical Assembly, Saint Paul, Minnesota, February 6, 1950.

ductus arteriosus does not represent a vital abnormality of any sort; instead it is a failure of normal closure after the child has been born.

It is not within the scope of this paper to discuss in detail the diagnosis of this abnormality. Suffice it to say that a machinery murmur is heard which distinguishes it from other abnormalities. The hazards which are recognized and occur rather frequently, and are an indication for surgery, are: (1) the diversion of so much blood from the aorta into the pulmonary artery that the individual has a belated physical development; (2) the heart may enlarge in an attempt to maintain the peripheral circulation at a satisfactory level; (3) there may be superimposed bacterial infection with streptococcus viridans; (4) the ductus may rupture.

Keys and Shapiro[25] have reviewed some 600 cases of untreated patent ductus arteriosus. They point out that patients who are alive at seventeen years of age, with an open ductus, have a life expectancy which averages about half that of the population as a whole. It is, therefore, on this basis that surgical intervention and closure of the vessel is a worthwhile procedure. This procedure is now being carried out in numerous clinics. As a matter of fact, a discussion of surgical intervention in patent ductus arteriosus was first held here in the state of Minnesota when Dr. Elliot Cutler visited as a Judd lecturer in 1935. At that time it was suggested to Dr. Wangensteen by Dr. George E. Fahr that ligature of the patent ductus was feasible and desirable. Dr. Cutler suggested that a Parham band be put around the ductus of a patient that was presented at that time. The first ductus operation in the state was performed by Dr. Owen H. Wangensteen[35] in 1939, and since that time about 100 have been done. Methods of closure of the ductus have undergone several stages of development, but the procedure that has been accepted by most surgeons is one in which the ductus is cut across and the ends ligated individually or suture ligations are used. The group under Dr. Alfred Blalock at Johns Hopkins has been the keenest proponent of suture ligation, which is to be differentiated from simple ligation.

The follow-up on patients who have had surgical closure of the ductus has shown most gratifying results. The mortality is less than 3 per cent in most series in the country. The difficulties of the technique that have to do with surgical mortality are mainly those due to hemorrhage. It is in the dissection of the posterior wall of the ductus that this complication is met with. We have learned by experience that in order to avoid this complication, it is well to complete the dissection upward toward the aortic arch while working beside the ductus, and to keep away from the thin-walled pulmonary artery, which is less tough and less able to withstand manipulations and mechanical injury.

Defects in the Auricular Septum.—Interauricular septal defect may or may not lead to disturbed function of the heart. In those cases in which a communication between the two auricles has been diagnosed, some attempt will surely be made in the future to close the communication. Patients who suffer from such conditions frequently seek medical attention. Among young adults it is probably the congenital malformation of the heart most frequently seen in medical practice and least frequently diagnosed correctly. Although in its most characteristic form this malformation produces an unusual clinical syndrome, the ausculatory findings are subject to wide variations, and, therefore, those who place reliance upon murmurs and thrills are frequently misled. Introcardiac catherization which has led to great progress in the diagnosis of cardiovascular disease may be used in the diagnosis of this defect.

Defects in the auricular septum are due to some failure in the formation of the septum, or failure in the anatomic closure of the foramen ovale. Whenever there is a gross defect in the auricular wall, there is free communication beetween the two auricles. The usual direction of flow of blood is from left to right because the pressure in the left auricle is generally somewhat higher than that in the right auricle. Complications consequent to the presence of this defect are such that an attempt at closure would be very beneficial. Cardiac arrhythmias are common. Pneumonia, pulmonary infections and pulmonary emboli are frequently encountered. Dilatation of the right heart may take place and does take place very frequently.

Attempts at closure of interatrial septal defects have been proposed in various communications. Cohn[13] attempted the invagination of the wall of the auricle and suture of this to the edges of the defect. We have been in the process of preparing an instrument which will work on a patch technique, as one patches a hole in a tire. This instrument will be inserted into the atrium and closure of the interatrial defect will be attempted with the use of a piece of pericardium held by means of clips. There is no doubt that the ultimate answer to intracardiac defects of this sort will be the extracorporeal heart of Gibbon[17] or Dennis.[10] However, until the time arrives when this apparatus shall have been perfected, some attempts at closure should be made in salvage cases.

A word at this time about an unusual condition associated with interatrial septal defect. This condition is known as the Lutembacher syndrome. This abnormality is an auricular septal defect combined with congenital or acquired mitral stenosis and enormous dilatation of the pulmonary artery. The abnormal size of the pulmonary artery is an integral part of the abnormality. Mitral stenosis, either congenital or acquired, increases the strain on the right side of the heart, and increases the dilatation of the pulmonary artery. It is the great enlargement of the pulmonary artery which differentiates this both clinically and at autopsy from other auricular septal defects. Dr. Osler Abbott[1] has attempted reduction in the size of the pulmonary artery recently. He has wrapped cellophane around the greatly dilated vessels in an attempt to relieve some of the pressure symptoms associated with this enlarged pulmonary artery and possibly to reduce the pulmonary blood flow. It is also interesting to note that this condition is exactly the one that is being produced in some cases of mitral stenosis, i.e., an interatrial septal defect to relieve the pressure in the left auricle.

Defects in the Ventricular Septum.—A common name for this disease is Maladie de Roger. Essentially an interventricular septal defect may be a high or a low defect. The high defect actually differs from the Maladie de Roger in that, instead of a perforation in the wall, the aortic septum fails to meet the ventricular septum. This occurs commonly in the tetralogy of Fallot or the Eisenmenger complex. Generally speaking, when a low defect is present, the prognosis in cases of a small lesion is excellent. It is only in cases in which the defect is so large that the arterio-venous shunt causes changes in the pulmonary vessels that the prognosis should be guarded. G. Gordon Murray[27] recently has used an ingenious method in attempting to close an interventricular septal defect. By landmarking the projections of the interventricular septum, on the anterior and posterior surfaces of the heart, he has pulled through in an anterior posterior direction, pieces of fascia lata and anchored them on the surface of the heart. In this way he has been able to reduce the flow of the left to right shunt that is present in an abnormality of this sort. It is our intention to use in this particular abnormality the instrument proposed for use in the interatrial septal defect.

Anomalies of the Aortic Arch.—Anomalies in the direction in which the aorta arches or abnormalities in the origin of the great vessels from the arch of the aorta are by no means rare. They may occur together or separately. When the aorta arches to the right, the descending aorta may lie either to the right or to the left of the spinal column. If the aorta arches to the right and descends upon the right, the condition is known as a right aortic arch. When, however, the aorta arches to the right and is drawn abruptly back to the left and descends upon the left, the condition is known as a right aortic arch with a left descending aorta.

Generally speaking, most of the anomalies do not require surgical therapy. However, there are some combinations in which, because of stridor, dyspnea, cyanosis, hoarseness and cough, surgical intervention is indicated:

1. *The combination of a retro-esophageal right aortic arch and left descending aorta, and a persistent anterior arch.* This is commonly known as a double aortic arch or aortic ring. The trachea and esophagus are included within the center of the ring and constricted. Surgical therapy for this anomaly requires division of the anterior limb of the aorta between the origins of the left common carotid artery and the left subclavian. The left common carotid artery is then tacked to the back of the sternum so that it will not press on the anterior surface of the trachea.[21]

2. *A right aortic arch with the descending aorta drawn to the left by a left ductus arteriosus.* There should be little difficulty in correcting this condition, as a division of the ductus will allow the pulmonary artery to fall forward, thus giving more room for the trachea and esophagus.

3. *Anomalous right subclavian artery.* This may give rise to a condition known as "dysphagia

lusoria." The right subclavian artery, instead of arising in a normal way from the innominate artery, has an origin from the left side of the aortic arch so that the vessel must course upward and to the right, crossing the midline, to reach its normal exit on the right side of the thoracic cage. In doing so, the vessel presses on the esophagus and produces symptoms at times. Surgical therapy consists of division of this anomalous vessel.[22]

Most of these conditions can be diagnosed with accuracy by the instillation of contrast media in the trachea and esophagus.

Coarctation of Aorta.—Coarctation of the aorta is a narrowed or completely obstructed area of the aorta. It has been classified as infantile or adult in type. A good deal of overlapping of the two types exists, and this arbitrary classification is rather useless from a surgical viewpoint.

Surgical intervention in this disease was first suggested by Blalock and Park,[6] and first performed on the human by Gross[20] in this country and Crafoord[14] in Sweden. Operation offers much hope to patients with this malformation. Reifenstein, Lavine, and Gross,[30] from a study of cases of coarctation of the aorta in order to determine the outlook for patients with this malformation, determined that subjects could be placed in one of four groups: (1) about one-fourth live far into adult life and old age with little or no incapacitation; (2) about one-fourth die from bacterial endocarditis or aortitis at an average age of twenty-eight years; (3) about one-fourth encounter sudden death from rupture of the aorta at an average age of twenty-seven; (4) about one-fourth die because of the hypertensive state from congestive failure at an average age of thirty-nine or from cranial hemorrhage at an average age of twenty-eight. Thus, in summary, it might be said that the average age of death of the patient with coarctation is thirty-five, including those patients who died from incidental causes. In those who die from coarctation or one of its complications, the average age at death is about thirty.

Operation for correction of this abnormality is successful and should be done. It is important to note that in young subjects with coarctation the pressures in the arms may be normal or slightly elevated, whereas in older persons one may find hypertension of moderate or marked degree. Once the diagnosis is made, it is my feeling that operation should be undertaken whether hypertension is marked or absent.

The operation that has been done to date has been a resection of the coarctation with an end-to-end anastomosis of the aorta. A patent ductus, if present, should be transected and ligated also. Gross recently has reported on the use of arterial grafts in the cases of coarctation in which it is impossible to bring the two ends together. In this recent report of Gross's,[23] he reports 100 coarctations in which surgical exploration was carried out in ninety-one. Eleven deaths have resulted, of which seven were felt to have been preventable by certain changes in surgical techniques, or which could have been prevented by declining operation in view of the presence of certain co-existing cardiovascular complications. All in all, the procedure of resection and end-to-end anastomosis of the aorta is a tried and thoroughly successful procedure.

Anomalies of the Aortic Valve and the Ascending Aorta.—Congenital aortic stenosis may be caused by an abnormal calcification of the aortic valves. Subaortic stenosis is caused by the persistence of a band or membrane of connective tissue which lies immediately beneath the aortic valves. It may be possible to section these obstructive mechanisms by the use of a valvulatome. Smithy,[33] before his untimely death, had perfected an experimental technique for aortic valvulotomy. It may indeed be possible in the future to section a stenosed aortic valve.

Malformations Which Deprive the Body of an Adequate Amount of Oxygenated Blood

The Tetralogy of Fallot.—Another brilliant chapter in the treatment of congenital heart disease was written by Blalock and Taussig.[7] The description by Fallot of a combination of anatomical abnormalities served to focus attention upon certain patients in the so-called "cyanotic group" of congenital heart disease. In this condition there is pulmonic stenosis or atresia, an interventricular septal defect, an aorta which overrides the septal defect and right ventricular hypertrophy. The severity of the cyanosis depends, in addition to other conditions, upon the degree of the pulmonic stenosis and the degree of overriding of the aorta. It is known that at least 5 grams of reduced hemoglobin per 100 cubic centimeters of circulating blood are necessary in order to produce obvious cyanosis.

The most important element of the contribution of Blalock and Taussig is the conception of the part played by an inadequate pulmonary flow. As a result of this, they postulated that the cyanosis and disability could be relieved by improving the blood supply to the lungs by anastomosing a systemic artery to a pulmonary artery. The proof of the correctness of this postulate lies in the good results of their operation. Cyanosis is often completely relieved and is always greatly lessened when a satisfactory anastomosis is possible; the disability is also greatly relieved. As the venous-arterial shunt persists, it may be impossible, except in the slighter cases, to relieve the cyanosis completely, at any rate after exercise.

There is no place where greater co-operation is necessary between internist, roentgenologist, anesthetist, nurse, and surgeon than in the treatment of this anomaly. Team work is essential. With the introduction of cardiac catheterization, it was assumed that this would be the entire answer to diagnosis. However, we now know that the information afforded by cardiac catheterization is essentially complementary to other investigations.

The essential criteria for successful completion of the operation on a patient are: (1) the primary difficulty must be lack of adequate pulmonary blood flow; (2) there must be a pulmonary artery to which the systemic artery can be anastomosed; (3) a systemic artery must be available for anastomosis; (4) the difference in pressure between systemic and pulmonic circulation must be such that blood will flow from aorta to pulmonary artery; (5) lung structure must be such that the patient can survive collapse of one lung and occlusion of one pulmonary artery; (6) the structure of the heart must be such that it can adjust to the altered circulation.

Having satisfied these postulates one may now choose various procedures. Blalock's preference has been the anastomosis of a subclavian artery to the pulmonary artery in an end-to-side manner. At times he has used the innominate or carotid artery. However, the mortality with use of the latter is rather high. Potts[29] has introduced a modification which utilized an ingenious clamp for direct anastomosis of the aorta to the pulmonary artery. The great advantage of the Potts operation lies in those cases in which the subclavian artery is too small or too short. Our experiences with the Potts procedure, though limited, suggest that it isn't technically very difficult to do. On the other hand, if it is possible to perform a Blalock type of operation, it would appear unjustifiable to choose deliberately to use the aorta instead.

Although pure valvular stenosis does occur in Fallot's tetralogy, it is certain that infundibular stenosis is more common. A moment's reflection shows that if it were possible to relieve this infundibular stenosis directly, it would be far better than short-circuiting it as in Blalock's operation. Brock,[8] of England, suggests another important advantage would be conferred by the operation. In Fallot's tetralogy, the cyanosis and disability are due to two things—the pulmonary stenosis, which allows too little blood to go to the lungs, and the septal defect with an overriding aorta which allows a mixing of venous with arterial blood. The Blalock operation increases the blood supply to the lungs, but does not relieve the right-to-left intracardiac shunt. If the pulmonary stenosis is severe, the blood in ventricular systole cannot pass quickly enough into the pulmonary artery, and must be diverted into the overriding aorta; if the degree of pulmonary stenosis is slight, a far greater portion of the blood can pass into the pulmonary artery, and a correspondingly smaller amount passes into the aorta. The effect of direct operation upon the pulmonary stenosis, and of relieving the obstruction to the outflow of the right ventricle will be not only to increase the amount of blood going to the lungs, but to lessen the amount passing through the shunt and causing venous arterial mixing. On this basis Brock has now operated upon five patients, and either resected a portion of the infundibular wall or dilated the stenosis manually.

Defective Development of the right ventricle and Tricuspid Atresia.—Inasmuch as the primary difficulty is lack of circulation to the lungs and the pulmonary pressure is low, the operation developed by Blalock and Taussig may prove of benefit in this condition.

Pure Pulmonary Stenosis.—In its simplest form, pure pulmonary stenosis may consist of a pure valvular stenosis with no interventricular septal defect. In most of these cases, cyanosis is absent or slight. The most frequent complication is the gradual production of a right heart failure. The correct treatment for this condition is relief of the valvular obstruction by valvulotomy. Brock has recorded five successful transventricular valvulotomies. The specially designed valvulotome is inserted in the right ventricle and passed up into the pulmonary artery.

Complete Transposition of the Great Vessels and the Common Associated Anomalies.—Complete transposition of the aorta and pulmonary artery is a congenital anomaly that is relatively common. In this abnormality, the aorta arises from the ventricle receiving oxygenated blood. Blood that is pumped by the left ventricle through the pulmonary artery to the lungs returns by the pulmonary veins and left auricle to its point of origin in the left ventricle. In other words, there is transposition of the great arteries without transposition of the great veins. Generally speaking, there is some degree of communication between the two arculations by way of septal defects or other abnormalities.

Blalock recently has subjected a group of patients with transposition to surgery. The operations fell into three main groups:

1. The construction of extracardiac shunts, either venous or arterial.
2. Creation of an auricular septal defect.
3. Combination of these two methods.

Blalock states that the combined procedures seem to offer likelihood of improvement. Though most of the patients have survived the operative procedure itself, the postoperative mortality is high. However, some hope to these unfortunate individuals is offered by the fact that some improvement has been made.

Anomalies of the Venous Return.—On occasion one of the pulmonary veins may enter the right auricle. This condition may not necessarily cause any immediate concern, but as adulthood is reached, an added strain may be put on the heart. The diagnosis is essentially one of cardiac catheterization. If and when this is made, surgical intervention is indicated. The vein is ligated or the lobe of lung, which it is draining, removed —probably the latter.

It must be added here, that the association of interauricular septal defects with this other anomaly is frequent. We have had occasion to explore a case of anomalous pulmonary vein, only to find that the catheter had passed through the septal defect into the normal opening of the vein in the left auricle.

Acquired Abnormalities

Sequelae of Rheumatic Heart Disease

Mitral Stenosis.—The need for a safe technical approach to the surgical treatment of chronic valvular disease of the heart has been recognized for many years. The idea is not new, as the surgical treatment of mitral stenosis was first suggested by Brunton[9] in 1902. In 1913 Dogen attempted actual dilatation of a stenosed pulmonary valve. In 1929 Cutler and Beck[15] summarized their personal experiences in the surgical treatment of eight cases of mitral stenosis and added four collected cases of chronic valvular disease subjected to operation. The mortality for the entire group was 83 per cent. Since that time much progress has been made in the field of thoracic surgery. These advances, combined with recent developments in chemotherapy and a sounder present-day concept of the prevention and treatment of shock, minimize many of the former hazards, and should permit reapplication of certain methods with significant reduction in mortality.

Valvulotomy.—Anatomically, the stenosed mitral valve can be reached by a suitable instrument by way of either the left ventricle or left auricle. It is not yet entirely clear as to which is the better approach. Objections have been raised as to the thinness of the auricular appendage wall. Our experiences with this segment of auricle have been that, quite the contrary, it is at times most thickened. Another objection has been the posterior position of the left auricle. Our experience in operating on patients with mitral stenosis, in order to ligate the auricular appendage, has been, that with extreme cardiac enlargement, the greatly dilated left atrium pushes the appendage anteriorly into the operative wound. With a curved valvulotome, much after the type that Harken has used, we are proposing to enter the left auricular chamber rather than the ventricle. In order to enter the left auricle by way of the left ventricle, it is necessary to dislocate the heart, which may lead to irregularities.

Valvulotomy has been performed recently by Harken, and Smithy. Sections of the leaflets are removed, particularly the posterior leaflet, Harken reports valvuloplasty in two patients with one death, while Smithy reports the successful excision of a segment of the stenosed mitral leaflet in three of seven patients. It is interesting to remark that one of his successful results is a technician now working in a Saint Paul hospital.

The exact indications for any procedure on the rheumatic mitral stenosed heart are not exactly clear yet. We wil not go into this, as we feel that a careful discussion by surgeons and internists is in order before definite conclusions can be reached. However, it is our feeling that this must be done soon, as surgery has definitely something to offer the patient with rheumatic mitral stenosis who cannot be controlled medically.

Commissurotomy.—In resection of part of the stenosed mitral valve, one inevitably creates an insufficiency. Are some types of insufficiency better borne than others? Ideally, surgical intervention should restore perfect valvular action; then the correction of obstruction in the light of the associated degree of insufficiency that is immediately produced, would not come under consideration. Bailey has approached this problem by an ingenious method of dividing the mitral valve at the fused commissures under digital control, a procedure which he has called commissurotomy.

Interatrial Septal Defect.—The interesting observation first reported by Lutembacher, that patients with mitral stenosis who have a co-existing patent interauricular septal defect, do not usually suffer from paroxysms of pulmonary edema, has led to the suggestion that such a defect might be created artificially in cases of mitral stenosis. Harken has created a defect in humans by means of a specially devised valvulotome. Blalock has attempted this procedure and used it in cases of transposition of the great vessels. We have experimentally used the approach of anastomosing the auricular appendages, either directly or by means of a vein graft.[32] By this method the interauricular defect, which is in effect produced, can be made under direct vision and can be broken down immediately, should the condition of the patient warrant it.

Pulmonary Vein to Azygos Vein Anastomosis.—Sweet[34] as used still another approach. He has anastomosed the superior segment branch of the inferior pulmonary vein to the azygos vein, thus creating a communication between the systemic and pulmonary circulations. Whereas the pulmonic circulation is a closed circuit, the systemic venous return is not; thus the right pressure within the left auricle can be distributed over a greater area.

Sympathectomy.—Some cases of mitral stenosis may not be considered candidates for cardiac intervention. This category includes patients whose incapacitating symptoms, particularly attacks of pulmonary edema, are associated with rapid heart action that cannot be controlled by medical measures. For this group of patients, a palliative procedure may be the removal of the cardiac sympathetic accelerator and afferent nerves.

Ligation of Auricular Appendage.—One of the most common causes of peripheral arterial emboli is rheumatic mitral stenosis. This disease occasions a showing of blood within the left atrium and left auricular appendage. This stasis of blood, coupled with auricular fibrillation, leads frequently to thrombus formation in the left atrium. These thrombi are the most common antecedents of peripheral emboli in rheumatic heart disease. The most common location of a thrombus in the left atrium is the left auricular appendage. Surgical efforts in eliminating embolization from this source, subsequent to rheumatic mitral stenosis would be of benefit.

Following preliminary animal experiments, simple ligation of the appendage at its junction with the left atrium was performed in three patients.[2] All of these patients had evidence of embolization and rheumatic mitral stenosis. In two of the patients, a total of three successful embolectomies of the extremities were performed previous to the auricular appendage ligations. The patients all withstood the procedures with surprising ease and the postoperative convalescence was uneventful.

Coronary Heart Disease

Interest in the surgical approach to the problem of coronary heart disease was stimulated by Claude Beck,[4] who formulated the concept of the "trigger zone" of myocardial anoxemia and of a prophylactic "blood bath" to such a functionally impaired area. He emphasized the fact that complete occlusion of all branches of a coronary artery, however small, supplying a given area of the heart resulted in far more rapid and irreversible damage to myocardial function than partial occlusion of much larger vessels.

Beck's first operation involved covering the heart with a flap of the pectoralis major muscle and suturing it to the parietal pericardium, using the vessels of that muscle as a source for a collateral blood supply. In subsequent studies he effected a new blood supply to the heart through vascular adhesions resulting from mechanical abrasion and chemical irritants.

O'Shaughnessy[28] used the omentum as a source for a collateral blood supply, bringing it up through the diaphragm and suturing it to the surface of the heart. Lezius,[26] on the other hand, utilized the lower or middle lobe of the left lung as a source for collateral blood supply. More recently, Carter[11] of Cincinnati has utilized the same approach.

Fauteux,[16] although not attempting to produce collateral coronary circulation, sought to relieve the symptoms of coronary heart disease by combining coronary vein ligation with pericoronary neurectomy. This, in effect, allows for arterial blood stasis, and therefore, absorption of more oxygen by the myocardium.

Recently Beck has utilized a new principle in treatment of myocardial infarction. Utilizing the coronary sinus as a new arterial pathway he has anastomosed a segment of artery to this channel as a direct bridge between the aorta and coronary sinus. It is his finding that a real revascularization of the heart takes place—blood getting into any ischemic area by the "back door," so to speak.

It must be finally mentioned that excision of infarcted areas of myocardium may be a therapy of the future. Murray found that in experimentally produced cardiac infarction, the infarcted area became dilated and functionally ineffectual from the time of arterial occlusion. By controlling the dilatation by excision of the dilated area and immediate suture, he was able to save the lives of many of his animals.

Constrictive Pericarditis

This acquired disease of the pericardium has succumbed to surgical intervention. When the diagnosis is made, and the sometimes associated tubercle bacillus found, then streptomycin and early operation are indicated. The results to date have been excellent. In a recent follow-up of eleven cases followed up to eleven years postoperatively, the majority of the patients, in whom a good decortication was possible, are at full work.

Pump Oxygenators

Finally we come to the ultimate in cardiac surgery—the extra-corporeal heart. By this method it will be possible to completely by-pass a bloodless heart and yet pump oxygenated blood into the arterial system. Through the ingenious efforts of Gibbon, this work was begun in 1939, and is still continuing. Dennis has been working on a similar machine. It can be said that the solution to this most amazing problem will surely come in the near future. Both of these workers have been able to keep animals alive for periods of time. There are problems still to be solved before a fool-proof apparatus is available.

Summary

A summary of some of the work on cardiac and juxta-cardiac surgery is presented. Surgery within this field is progressing rapidly. It is essentially due to the great progress made in the physiology of the chest and in vascular techniques. A co-operative spirit between all members of the medical profession concerned in the care of individuals with acquired or congenital heart disease is a necessity in the furtherance of this field. The future of cardiac surgery holds great promise as shown by the studies made in experimental surgery of this type.

BANTI'S DISEASE

Report of Two Cases Treated by Splenectomy and Later Gastrectomy

CHARLES E. REA, M.D., WERNER W. AMERONGEN, M.D., and CHARLES H. MANLOVE, M.D.
Saint Paul, Minnesota

THE purpose of this paper is to evaluate the various treatments of Banti's disease and cirrhosis of the liver. Really, what will be discussed is the treatment of portal hypertension and its sequelae.

Portal hypertension has been divided into two main groups (Whipple): those having intrahepatic block and those having extrahepatic portal block. In the first group is included the cirrhoses and in the second group cases of fibrous replacement and/or thrombosis of the portal vein or of a main tributary, cavernous transformation of the portal vein or its tributaries, stenosis of the portal vein, et cetera. Banti's disease belongs in the second group.

In 1894 Banti described the symptom-complex which bears his name. There are three stages of the disease: (1) the anemic phase, with splenomegaly, asthenia, and occasional gastrointestinal hemorrhages; (2) transitional stage, with oliguria, urobilinuria, hepatomegaly, pigment disturbances of the skin and increasing gastrointestinal disturbances; (3) ascitic stage, with atrophy of the liver, hemorrhage, and death.

It is interesting that one of the workers in Aschoff's laboratory studied the original sections of the spleens described by Banti and found no difference between them and those of Laennec's cirrhosis. It is often stated that Banti's disease is just another phase of cirrhosis of the liver. In Banti's disease the "cirrhosis" starts in the spleen and then goes to the liver, while in Laennec's cirrhosis, the fibrosis starts in the liver and ends up in the spleen. While it is true that late cases of Banti's disease and cirrhosis may be indistinguishable, certainly earlier in the disease, the enlargement and fibrosis may be limited to the spleen with no appreciable involvement of the liver.

As to etiology, Banti's syndrome may be caused by various mechanical disturbances of the portal system. These have been listed by Baronofsky as follows:

1. *Thromboses of the splenic and/or portal veins.* (Warthin, 1910, Opitz, 1924, Rosenthal, 1925, Wallgren, 1927, Wilson and Lederer, 1929, Noble and Wagner, 1933, Mallory, 1934, Smith and Farber, 1935, Klemperer, 1938.)
   - (a) Various inflammations of the upper abdomen (pancreatitis, et cetera).
   - (b) Acute infectious diseases.
   - (c) Infectious processes in spleen itself.
   - (d) Primary degeneration in vein wall akin to atherosclerosis of arteries.
   - (e) Trauma.
2. *Cavernomatous transformation of the portal vein.* Beitzke (1910) and Hart (1913) were of the opinion that this is a typical congenital malformation. Risel (1909), Verse (1910), and Emmerich (1912), believed that the cause of this must be sought in a thrombosis of the portal vein followed by organization and recanalization. Pick (1909) on the other hand argues that this is a neoplastic lesion, an angioma, or cavernoma of the hepatoduodenal ligament, inasmuch as in some cases the process extends far beyond the limits of the portal vein.
3. *Stenoses of the portal vein.* (Leon-Kindberg, 1914.)
4. *Compression of the portal or splenic veins from without.*
   - (a) Adhesions from previous peritonitis (Smith and Farber, 1935).
   - (b) Enlarged lmyph nodes (Smith and Farber, 1935).
   - (c) Gallstones (Armstrong, 1906).
5. *Congenital narrowing of the portal bed in liver.* (Moschokowitz, 1917.)
6. *Cirrhosis of the liver.*
7. *Congestive splenomegaly without cirrhoses.* (Rolleston, 1914, Larrabee, 1934, Eppinger, 1937, Rousselot, 1940.)

What causes death in the late stages of Banti's disease and cirrhosis of the liver? First: hemorrhage. In reviewing the cases of cirrhosis of the liver and Banti's disease seen at Ancker, Bethesda,

---

Dr. Rea is from the Department of Surgery, University of Minnesota Medical School.

Dr. Amerongen is on the staff, Bethesda Hospital, Saint Paul, Minnesota.

Dr. Manlove is resident pathologist, Ancker Hospital, Saint Paul, Minnesota.

Presented before the Minnesota Academy of Medicine, Saint Paul, Minnesota, December 14, 1949.

One of the best reviews on portal hypertension is that by Baronofsky.[2] His paper has been widely quoted in this article.

TABLE I. INCIDENCE OF HEMATEMESIS IN BANTI'S DISEASE AND CIRRHOSIS OF THE LIVER

Hospital	No. of Cases	Hemorrhage	Died	Died of Hemorrhage
Ancker	231	29	—	20
Bethesda	49	8	15	7
Miller	45	8	—	—
St. Joseph's	83	32	35	16

Miller and St. Joseph's Hospital, Saint Paul, Minnesota, over a ten-year period, it was noted that of patients who came in with hematemesis, over half die from this complication (Table I).

Secondly, some patients with Banti's disease and cirrhosis of the liver die of hepatic insufficiency. Hepatic insufficiency greatly increases the risk of any surgical procedure. It is well known that such patients do not stand anesthesia well. Cirrhosis of the liver with ascites is not a contraindication to surgery as hepatic insufficiency may not follow for a long time.

Thirdly, some of the patients with Banti's disease succumb to intercurrent infection.

It is important to know how long a patient will live with Banti's disease or cirrhosis of the liver without any treatment. This is impossible to state as there is no series in the available literature in which such cases have been followed from onset of the disease until death. After all, the cause of these conditions is not known. All the physician can hope to do is to reverse or stop the progress of the liver damage if it is not too far advanced by means of diet, vitamins, et cetera. All the surgeon can hope to do is to decrease the portal hypertension or to control hemorrhage from bleeding "esophageal varices." The surgeon should always attempt to have the patient live more comfortably if not longer.

The treatment of Banti's disease and cirrhosis of the liver is aimed at the alleviation of the portal hypertension or its sequelae. One of the most serious of these sequelae is hemorrhage from ruptured esophageal varices. This complication may be treated:

1. Conservatively, by blood transfusion, sedation, et cetera, in the hope that the bleeding will stop by itself.

2. Tamponade. By balloon attachments to a Miller-Abbott tube it is hoped to exert pressure on the bleeding esophageal veins and thereby control hemorrhage. However, it is difficult to place or hold the distended balloon accurately. While an occasional brilliant result is seen, the method is unsatisfactory at present in most instances of bleeding esophageal varices.

3. Injection of esophageal varices. This method was first introduced by Crawford and Frenckner of Sweden in 1939, and popularized in this country by Moersch. The method is akin to the injection treatment of varicose veins of the extremity. It requires skill with the esophagoscope, is at best palliative, and is of little value if the vein is actively bleeding.

To relieve portal hypertension in cirrhosis and Banti's disease, the following methods have been proposed:

1. Talma-Morrison operation. In this operation, an attempt is made to shunt the blood from the portal to the systemic circulation by suturing the omentum to the anterior abdominal wall; by forming adhesions between the liver and the spleen with the vault of the diaphragm on the anterior abdominal wall, and between the gall bladder and the anterior abdominal wall. As compared to control series, the patients do not live longer nor do they show marked improvement; therefore, the operation has been largely abandoned.

2. Splenectomy. The rationale of splenectomy in the treatment of portal hypertension is that removal of the spleen decreases the circulatory portal blood volume. It is commonly said that splenectomy removes 40 per cent of the portal blood volume. Probably more correct is the statement that in normal animals the stomach and spleen together supply about 40 per cent of the portal blood, the spleen itself about 18 per cent. Removal of the spleen could conceivably do some good in early cases of Banti's disease due to thrombosis limited to the portal vein. As a means of controlling hemorrhage from esophageal varices, splenectomy leaves much to be desired, as in the cases of Banti's disease treated by splenectomy over a ten-year period at Ancker, Bethesda, Miller, and St. Joseph's Hospital, Saint Paul, over half had hematemesis afterwards. The fact that one patient had hemorrhages twenty-four years and another eighteen years after splenectomy shows the necessity for studying these patients over a long period of time (Table II).

3. Eck fistula. In anastomosing the portal vein and inferior vena cava (Eck fistula) the passive congestion of all structures drained by the portal system is relieved. There are several bad features of this operation however.

TABLE II. HEMATEMESIS AFTER SPLENECTOMY IN BANTI'S DISEASE

Hospital No.	Sex	Age in Years	Splenectomy	Post-operative hematemesis	Course
Miller Hospital					
A-20290	F	40	+	−	L & W—2 yrs.
A-23086	F	51	−	−	L & W.
A-2708	F	60	−	−	Died hemorrhage.
A-36287	F	27	+	+	Hemorrhage off and on 18 yrs.
A-1144	F	15	+	+	Died hemorrhage and ascites 4 yrs. later.
St. Joseph's Hospital					
D-12318	F	36	+ 1941	+	Died 1-19-47, Hemorrhage.
D-48314	M	21	+	+	Died 13 mo. later Hemorrhage.
Ancker Hospital					
A-26165	M	16	+	+	Died 2 yrs. later Hemorrhage.
A-33489	M	17	+	−	P. O. peritonitis.
A-149017	M	44	+	−	L & W—3 yrs.
A-126046	M	50	+	−	L & W—5 yrs.
Bethesda Hospital					
178064	M	19	−	+	Bleeds off and on 12 yrs.
181572	M	28	+	+ 48 hrs.	90% gastric resection.

(a) Follow-up study of patients so treated has shown that some of the patients have had episodes of bleeding since operation and post-mortem examinations on some have shown occlusion of the anastomosis.

(b) In some cases fibrous or cavernomatous transformation of the portal vein has made the likelihood of being able to anastomose either the main trunk or one of its larger tributaries with the inferior vena cava, even with utilization of a vein graft, improbable.

4. Splenorenal anastomosis. Anastomosis of the splenic vein to the renal vein reduces the portal hypertension, but the following objections have been raised against this procedure:

(a) The operation may mean the sacrificing of a normal kidney, although by the use of an end to side anastomosis, it is not necessary to sacrifice the kidney.

(b) In a certain number of cases, thrombosis occurs at the site of anastomosis.

(c) In removing the lumbar veins, more collateral circulation is often removed than is obtained by the splenorenal anastomosis (Learmonth).

5. Gastric resection. Before considering the rationale of gastric resection to relieve portal hypertension, the question of the source of hematemesis in portal hypertension should be discussed. It is generally thought that the hematemesis comes from bleeding esophageal varices. The varices may bleed as a result of injury. It hardly seems reasonable to assume that the mere hydrostatic distention of these veins and their eventual rupture is the sole cause of the hematemesis (Baronofsky). In some instances, there are no demonstrable lesions in the esophagus, but ulcers or erosion of the cardia are present. There is no good statistical evidence how often this occurs. It is interesting that duodenal ulcers are often found at post-mortem examination of cirrhotic patients who have died of hemorrhage from ruptured esophageal varices. Of three patients at Bethesda Hospital who died of the above condition, all had chronic duodenal ulcers. However, at Ancker Hospital, of forty-five patients with cirrhosis and esophageal varices, only two had duodenal ulcers at death. How often duodenal ulcers occur in hepatic disease is not known. This incidence of duodenal ulcer in cirrhosis is mentioned not so much as a source of hematemesis as to emphasize the possible gastric acidity factor in injuring the esophageal and duodenal mucosa.

Regurgitation of gastric digestive juice into the esophagus is not an uncommon occurrence. That acid has a harmful effect on a decreased or injured esophageal mucosa is well known (Friedenwold, Feldman, and Zinn). Baronofsky and Wangensteen have shown that with impairment of the nutrition of the mucous membrane of the stomach, duodenum and esophagus due to venous pooling, these areas are lowered in resistance and will be easy prey to the gastric digestive juices. Wangensteen and Baronofsky in their experimental work on portal hypertension explored the following theses:

1. If the acid peptic factor of gastric secretion is important in the causation of erosions in the esophagus, then extensive or total gastrectomy would eliminate this.
2. If the stomach drains into the portal circulation and the esophagus into the caval, and there is a communication between the two, then isolation of the esophagus from the portal circulation by means of gastrectomy should prove satisfactory in preventing hemorrhage.
3. If extensive gastrectomy were done, there would be an additional reduction of blood inflow into the portal system over the attending splenectomy.

Baronofsky found that in the presence of portal hypertension in dogs an extensive (90 per cent) gastric resection afforded real but not absolute protection against histamine-provoked ulcer. Normally, 75 per cent gastric resection affords protection against histamine-provoked ulcer, but this percentage affords no protection in the presence of portal hypertension.

Clinically, Wangensteen has stressed that one must perform a total gastrectomy to afford absolute protection against the esophageal bleeding in portal hypertension. Also, one must take into consideration the liver function of the patient. Of eight patients with portal hypertension treated by gastric resection, four died, three having a definite impairment in liver function.

Phemister and Humphreys performed a total gastrectomy and an esophagogastric resection for bleeding due to Banti's disease. Esophagogastric resection is a more direct approach to management of esophageal varices as it separates the esophagus completely from the higher venous pressure of the portal circulation. Wangensteen's idea of the amount of stomach that it is necessary to remove is physiologically sound and is of clinical value. When, on exploration, the liver appears normal, as it usually does in Banti's disease, the measurement of the venous pressure in one of the tributaries of the portal vein is important. In thrombophlebitis of the portal vein, the venous pressure will be up, whereas in bleeding from a silent, nonpalpable gastric erosion, the venous pressure will be normal. For the latter type of case, the conventional 75 per cent gastric resection is adequate; for the portal hypertension, at least a 95 per cent resection should be done (Wangensteen).

It should be recorded that a subtotal esophagocardiectomy does not control hematemesis in Banti's disease. Scott and Longmire report such a case, in which later a total gastric resection was performed, eliminating all signs of hemorrhage from the intestinal tract.

Two cases of Banti's disease are presented which were treated by splenectomy and finally a gastric resection.

Case 1.—The first patient was a white man, thirty-seven years old. At the age of seven years, his spleen was removed for "splenic anemia." Six weeks before admission to the hospital he had a gastrointestinal study because of epigastric distress, fullness and loss of appetite. The x-ray report states that he had active duodenal ulcer. The day before admission to the hospital, the patient had a hematemesis which, in spite of transfusion, sedation and rest, persisted. The preoperative diagnosis was bleeding duodenal ulcer. At operation, no ulceration could be felt or seen in the duodenum or stomach. At the esophagocardial junction were large varices. The bleeding from esophagus was so profuse that it was packed temporarily with gauze to partially control it. A total gastrectomy was performed anastomosing the jejunum to the esophagus with an entero-enterostomy between the limbs of the jejunum. The patient made an uneventful recovery and has remained well and free from hemorrhage for three years.

Case 2.—The second patient was a twenty-seven-year-old man who had "spleen trouble and hemorrhages" since he was four years old. For two months before admission to the hospital he had noticed tarry stools and was weak. He was admitted to the hospital in shock after a massive hematemesis. The patient was transfused and his general condition improved. On August 26, 1949, a splenectomy was performed. An 800 gram fibrotic spleen was removed. The liver appeared normal. Within forty-eight hours after splenectomy the patient had hematemesis which practically exsanguinated him. He was transfused until his blood pressure, pulse and hemoglobin were at normal level, and on September 6, 1949, a 90 per cent gastric resection was performed. Dilated esophageal veins were noted at operation. The patient has had no more hemorrhages three months after the resection.

Summary

The current ideas concerning the treatment of portal hypertension have been reviewed. In early cases of Banti's disease due to thrombosis or

thrombophlebitis of the splenic vein, splenectomy may be curative; however, splenectomy for hemorrhage due to bleeding esophageal varices in Banti's disease or cirrhosis of the liver is of questionable value.

From an anatomic and physiologic point of view, a total gastric resection or esophagogastrectomy is the procedure of choice in the treatment of bleeding esophageal varices or lesions of the cardiac end of the stomach in cirrhosis of the liver or Banti's disease.

How to evaluate an Eck fistula or splenorenal anastomoses in the treatment of portal hypertension is difficult, as not enough time has elapsed to indicate the eventual outcome. The objections to these procedures have been discussed.

Two cases of Banti's disease are reported which had been treated by splenectomy before a gastric resection was performed to control hematemesis. While these patients have been followed only three months and three years respectively, the results are encouraging enough to warrant gastric resection in such patients in the future.

Discussion

Dr. Ivan D. Baronofsky (by invitation): I have very little to add to Dr. Rea's excellent discussion of the subject. Dr. Rea is to be congratulated on his excellent results in the treatment of such a fatal disease. I should like to present some of the experimental work that was done while at the experimental surgery laboratory at the University, under Dr. Wangensteen. Before I begin, I should like to mention that Dr. Longmire, while at the Johns Hopkins Hospital, recently included a series of some sixty total gastrectomies. One of these gastrectomies was done for portal hypertension and bleeding. In the laboratory, experiments were carried out on dogs and on animals that were usually resistant to the effects of histamine and beeswax, such as the rabbit. (Slides shown) In the rabbit it has been practically impossible to produce peptic ulcer or erosion by means of histamine and beeswax. Dr. Lannin was finally able to produce these lesions only when the animals had been on a carrot juice diet for a period of at least two weeks. The reason for the inability to produce ulcers, without that type of diet, is probably that the rabbit's stomach is always filled with food. This food absorbs the acid secretions and therefore this erosive factor is not effective.

(Slides shown) Here is a slide that shows the effect of portal hypertension on a rabbit's stomach. This animal, in addition to the splenic tie procedure, has had histamine and beeswax for three days. As you can see there are multiple bleeding points and ulcers in the entire specimen. A word here about the splenic tie procedure. In some of the animals, if the splenic vein is ligated distal to its junction with the gastroepiploic vein, the blood will get back to the heart by way of the esophagus and in effect a portal hypertensionlike syndrome is produced.

We then put this thesis to work in the dog. In Dr. Wangensteen's laboratory it has been found that in order that complete protection from the ulcer diathesis be obtained, one must do the following things in a gastric resection for peptic ulcer: (1) a 75 per cent gastrectomy, (2) removal of the antrum, (3) removal of the entire lesser curvature, (4) a short loop anastomosis. When these criteria were applied to a dog with a splenic tie and the dog was given histamine and beeswax for three to five days, no protection was obtained. In other words portal hypertension greatly accelerated the ulcer diathesis. In fact so much so that a normal dog will easily get ulcers in five days if cellophane is placed around the portal vein.

We then came to the conclusion that in portal hypertension an even greater resection would be necessary. We therefore gave a series of sixteen animals that had had a 90 per cent resection and splenic tie procedure, histamine and beeswax for a period of five days. All the animals except two were protected against the ulcer diathesis. In other words a 90 per cent resection could afford protection in the great majority of animals, but not all. One must therefore do either a total gastric resection or something closely akin to such a procedure, in order to protect against the bleeding ulcer diathesis associated with portal hypertension. In addition to removing the stomach, the spleen is also removed. Thus, three things are accomplished: (1) the acid peptic factor is removed, (2) there is a separation of the stomach and portal blood flows, (3) about 40 per cent of the inflow of the portal vein is removed.

Dr. C. J. Watson: This is a subject I have been interested in for a long time. I was glad Dr. Rea pointed out that there is such a thing as primary splenic fibrosis. In recent years, clinicians and pathologists alike have often said that what we have called Banti's disease is simply a congestive splenomegaly. Granting that this is true in the majority of cases, I have nevertheless seen a number of instances of diffuse splenic fibrosis with esophageal varices in which there was no evidence of cirrhosis of the liver, nor of disease of the portal vein. I believe, therefore, that there is a relatively small group of cases of primary diffuse splenic fibrosis. I recall one young man about twenty years of age with a large spleen and repeated hematemesis. Liver function was quite seriously disturbed (this case was studied in the days before we were doing liver biopsies). He died, and at autopsy his liver appeared histologically normal. No evidence of disease in the portal or splenic vein was found, but he did have esophageal varices.

The rationale of gastric resection for hematemesis due to bleeding varices is quite interesting to me. I can remember quite a number of instances of bleeding varices seen at autopsy; if one does find the place that bleeds, it is usually nothing more than a little slit in the varix. If one ties off the great veins *in situ* before the gastrointestinal tract is opened, one has a much better chance of finding the bleeding varix. I have yet to see a peptic ulcer or anything resembling it in a bleeding esophageal varix, although it is true that a few such instances have been recorded. I would say that, by and large, the cause of bleeding from an esophageal varix is an injury of the wall of the vein. With the little protection these veins have, it is not too remarkable that a slight injury can cause a tear or slit sufficient to produce a massive hemorrhage. It should be noted that these patients commonly have hypoprothrombinemia and/or thrombocytopenia, to contribute to further bleeding, once started.

To try to carry out any major surgical procedure in a patient with cirrhosis of the liver is to invite disaster. They do not tolerate anesthesia or prolonged operations at all well. They easily develop hepatic coma after a surgical procedure. I think it necessary to wait a long while and accumulate a large series before any individual method of treatment of bleeding varices can be judged. It is well known that there may be long intervals, even several years, between bleeding episodes in these cases.

Cirrhosis may be present for years in relatively static condition. Ascites, with or without jaundice, no longer offers the fatal prognosis in all cases, which used to be assumed. In fact, cirrhosis isn't quite as bad as we used to think it was. The fatty cirrhosis group, related to alcoholism and dietary deficiency, responds remarkably well to a good diet, if not too far advanced. The bleeding varix problem, however, is a bad one, and we don't have very much to do for it medically. The suggestion has been made that direct tamponade of the varices by means of an inflated condom type balloon might be effective, and in fact, I believe that Dr. Hoffbauer has been successful in stopping bleeding with this method, in some cases.

Dr. Clarence Dennis: I would like to ask if you have any information on liver function after anastomosis of the portal vein and the vena cava.

Dr. Watson: Not a great deal. Dr. Hanger tells me that in some instances there has been a remarkable improvement in liver function, the cephalin flocculation and serum bilirubin at times decreasing significantly. Since Dr. Hanger is a very careful student of liver disease, I am willing to accept the idea that at least some of these individuals do have their liver function improved by diverting the portal blood flow.

Dr. Rea (in closing): The purpose of the gastric resection in bleeding varices would be: (a) to reduce the acid peptic factor of gastric secretion, which we know is important in the causation of erosions of the esophagus, and (b) to bring about an additional reduction of blood inflow into the portal vein over that attending splenectomy.

The source of hematemesis in portal hypertension is of interest. Bleeding esophageal varices are considered the most common cause. While esophageal varices may bleed from trauma, in the light of our experimental knowledge, it is plausible that gastric acidity may cause erosions of the esophagus and cardia of the stomach with resulting bleeding without any trauma factor. It should be noted that patients with obstruction of the superior vena cava exhibiting esophageal varices apparently do not bleed. Also it has been reported that patients with unrelated diseases like coronary disease may have esophageal varices.

Given a patient with bleeding esophageal varices, with fairly good liver function, if the bleeding could not be controlled by conservative methods, I should feel safer performing a total gastrectomy at the present time rather than doing any of the other procedures.

CANCER GRANTS TOTAL MILLION AND THIRD DOLLARS IN WEEK

Federal cancer grants totaling slightly more than one and one-third million dollars were announced in the last week. Seven universities and hospitals get $575,000 for construction of research, facilities, thirty-three schools get $522,000 for teaching purposes, and the remaining $301,159 goes for control projects in twelve states. Institutions sharing in construction grants are North Carolina University; South Carolina Medical College; Wayne University; Children's Medical Center of Boston; Beth Israel Hospital, Boston; Boston University School of Medicine; and Iowa State University, College of Medicine. . . . Over the past twenty-five months, U. S. has approved grants of $210,000,000 toward construction of 1,019 hospitals and health centers under the Hill-Burton Act; total cost of the projects is more than half a billion dollars, with the difference financed by state, local and private institutions. Only 139 of the institutions are in operation now, the remainder under construction or in the blueprint stage. . . . Water pollution grants to states and interstate agencies are expected to total just under one million dollars for the fiscal year ending June 30.—A.M.A., Washington Office, March 14, 1950.

PSYCHIATRY IN GERIATRICS

WALTER P. GARDNER, M.D., F.A.C.P
Saint Paul, Minnesota

BECAUSE of the scope of the problem of the aged, it is felt worthwhile to review certain psychiatric aspects of geriatrics.

It has been estimated[14] that whereas in 1900 4 per cent of the population of the United States of America were over sixty-five years of age, and in 1935 6 per cent, by 1980 approximately 14 per cent will fall in that age group. Between 1930 and 1940 the increase in persons over sixty-five was 35 per cent, whereas the increase in the general population was only 7.2 per cent. The United States Bureau of Census reported that in 1940 there were 8,956,206 persons more than sixty-five years of age.

"White men now at the age of sixty-five can expect to live an additional twelve and one-half years and white women an average of fourteen and one-half years."[19]

To quote Doll[5]: "Our goal should be to insure that the major share of added years will lengthen the period of prime rather than prolong the periods of dependent youth and decrepit old age. We may welcome rather than fear the prospect of long life only if the accumulated years are worth living by adding to the sum of usefulness and happiness of human life throughout its whole span."

Maladjustments and behavioral breakdowns, psychiatric problems, occur at a high rate in the age group sixty-five and over. These include the less severe psychiatric disorders such as maladjustments in the mentally normal, mental aberrations, benign abnormal sexual behavior, alcoholism, and certain psychoneurotic manifestations. More grave psychiatric disorders, such as frank psychoses and severe reactive depressions, also occur. Physical, social, and psychological factors are involved in their production.

As elsewhere in the body, certain alterations occur in the brain with advancing years. Numerous changes begin in all layers of the cerebral arteries.[1] The larger arteries show an extensive intimal arteriosclerosis and a medial fibrosis. Similar alterations occur in the smaller vessels. They lead to narrowing of the lumen of the vessel with resulting ischemia and encephalomalacia of the area supplied, and to increased fragility of the vessel walls. The meninges become thickened and opaque, and cerebral atrophy occurs, particularly in the frontal lobes. Diffuse nerve cell changes, senile plaques, and less frequently neurofibrillary degeneration as well as the vascular changes are seen microscopically.

Since some brains show more evidence of these changes at age fifty than others at age seventy-five, it is obvious that chronological age is not the only element at work here. Heredity as well as various other factors influence this aging process. These alterations need not lead to psychiatric symptoms.

Changes incident to aging of other parts of the body are important. Impaired absorption from an atrophic gastrointestinal mucosa and loss of teeth, with resulting undernourishment and vitamin deficiency, are significant as are decreased kidney function, endocrine imbalances[6] and auditory and visual impairments. Physical illnesses and injuries act as causative agents in psychiatric geriatric problems. They may precipitate the physical changes of the aging process in the brain and elsewhere in the body. Again they may be the direct etiologic factor of the disorder, as for example in psychoses due to brain trauma, due to brain tumor, and in many other psychoses of the organic reaction type.

Social elements play a role in producing maladjustments and behavioral breakdowns in the aged. The older person finds himself progressively shunted away from both his work group and his family setting. Employment is difficult for him to retain, and once it is lost, extremely hard to obtain. Members of his family group tend to scatter into distant areas. His friends and relatives progressively move away or die. He finds himself more and more without firm social ties.

One etiologic factor of a psychologic nature is the underlying personality makeup. It would appear that persons of a stable personality tend to withstand considerable amounts of cerebral damage and environmental pressure without exhibiting serious psychiatric manifestations, whereas individuals who have been poorly adjusted or inadequate earlier in life are more likely to fare

---

Inaugural thesis presented at the meeting of the Minnesota Academy of Medicine, December 14, 1949.

badly under such attacks. Evidence is increasing that social and psychological factors are very significant in the etiology of these problems.[12,13,15,16,20]

Many persons live to advanced years with little apparent interference with their mental functioning. However, frequently simple adult maladjustment occurs in such persons. When it does, it resembles the same syndrome as seen in earlier periods of life. When mental changes do appear, they are of one or usually more than one of three types—intellectual impairment, affective abnormalities, and conduct disorders.

Certain alterations may be considered within reasonable limits to be evidences of normal aging. These limits admittedly are hard to define. They may be termed "mental aberrations." Some are essentially exaggerations of previously existing personality traits. The person fatigues very readily on physical or mental exertion. He is less alert, less able to concentrate over periods of time, less able to assimilate new knowledge, and less able to retain experiences of all types and to recall them at will. A narrowing of the span of interest and fixation of ideas, especially upon bodily health, may often be noted. Emotional instability may be exhibited in easy and excessive swings of mood, irritability, unwarranted feelings of well-being with boasting, or in some instances by more or less prolonged periods of mild depression. At times mild feelings of persecution or unwantedness, i.e., paranoid trends, may be seen. The attitudes of others may be a basis for these trends, or feelings of, or fears of his own disintegration with attendant anxiety may be projected into the environment. Overtalkativeness and reminiscing, selfishness and self-centeredness, resistance to change and willfulness may be apparent. Abnormalities in eating habits, including overeating or refusal to take adequate nourishment, are common. Untidiness about the body and the clothing and carelessness in toilet habits may present themselves.

Benign abormal sexual behavior may appear as one of the mental aberrations or as the chief problem of an otherwise quite well adjusted aged person. It is not uncommon to find such persons who are not frankly psychotic exhibiting their external genital organs or fondling the external genital organs of others, particularly of the opposite sex. This form of behavior is more common in males than in females. Old men frequently annoy or molest young girls. They make no attempt or poorly conceived attempts to conceal their acts. The resumption of masturbation and the reappearance of desire for sexual intercourse with or without functional potency may occur in advanced years. The latter may lead to ill-advised marriages. Such activities are preferred to as benign in contradistinction to attempted rape, rape and even more serious "sexual crimes" committed by elderly persons who are seriously disordered mentally.

The basic factors lying behind the production of geriatric psychiatric problems may lead to a picture colored chiefly by alcoholism, or again alcoholism which began earlier in life may continue into old age. Its treatment demands the employment of proper methods for the withdrawal of alcohol, a plan of management such as other maladjustments and behavioral problems require, and in some instances more formal psychotherapy.

In geriatric patients the neuroses or psychoneuroses may appear superimposed upon the background of symptoms referred to as normal in aging persons, or they may be manifested by individuals who are sound mentally. The symptoms are chiefly hypochondriacal in nature, although anxiety states and simple reactive depressions are not infrequently seen. Here again, in addition to other general measures of management, more formal psychotherapy may be required in their treatment.

A plan for the prevention of and management of these minor psychiatric disorders of the aged must include adequate attention to the individual's physical needs and the meeting of his psychological and social needs. The family, the individual himself, industry, the community (government) and medicine and its allied sciences each have responsibilities in such a program.

Any consideration of the physical needs of older persons must center about the prevention inasfar as is possible of the development of and the progression of chronic diseases, the treatment of such diseases, the correction inasfar as is possible of physical defects and attention to adequate nutrition.

The prevalence of chronic disease increases with age although it is well recognized that it is not a feature of old age alone. The most important of the chronic diseases are various forms of heart disease, arteriosclerosis, essential hypertension, nervous and mental disease, kidney disease, tuberculosis, diabetes, and asthma. Increasing attention is being given to the provision of adequate facilities for the care of persons suffering from such diseases in chronic disease hospitals, maintained usually as integral parts of general hospitals, and in convalescent and nursing homes. However, the fact remains[17] that the majority of persons who are chronically ill can be best cared for at home and in the office and clinic. Rehabilitation rather than attention to acute needs must be the keynote of the treatment of these diseases.

Defects in hearing and vision should be corrected inasfar as is possible. Proper dental care is highly important. Other physical defects such as certain surgical conditions and the physical sequellae of cerebral vascular accidents and other neurological disorders demand rehabilitation.

The importance of adequate nutrition at this age and the problems involved, including the administration of supplemental vitamins, has been stressed[8,18] in the literature.

Concurrent with efforts to provide him with the best possible physical health, a program of attention to the psychological and social needs of the individual must be pursued. A major share of this program must be carried out by the family. They must be taught the nature of the patient's psychological needs. These have been delineated by Laycock [11] as:

1. The need for affection. To live in reciprocal warm regard with one or more human beings.
2. The need for belonging. To be a desired and desirable member of a group.
3. The need for independence. Reasonably to order one's own life and make one's own decisions.
4. The need for achievement. To do things, to accomplish tasks, to create things and to find success.
5. The need for recognition. To feel that one's personality and conduct meet the reasonable approval of one's peers.
6. The need for self-esteem. To feel that one's personality and conduct come up reasonably well to one's own inner standards.

It is the duty of the family or the family substitutes to help older persons fulfill these interdependent and somewhat overlapping needs.

The need for affection is marked. Frequently his mate, many of his friends and associates of his own age and even some of his children have died or are no longer near him. Those about him must provide him with a feeling of emotional security. If they do not, the aged person seeks to gain attention, usually without realizing it, by exaggerating his physical illnesses and other handicaps and by complaining that no one ever tells him anything, that no one cares for him, and the like.

The need for belonging obviously shades into the preceding need. The older person must be made to feel that he is a wanted member of a group, ideally of a family group. The younger members of the family should, where possible, include the older person in their activities. Where this is not feasible, he should be informed in advance what the others plan to do and why he cannot participate in the activity.

The loss of independence is very difficult for anyone to accept. . The older person loses much of his feeling of independence when he is forced to give up his life's work. Children err as often in the matter of overprotection as they do in failure to show affection. The older person resents being watched too closely, being told to be sure to dress warmly, to stay out of the rain, to stay out of the sun, to eat more, to eat less, and the like. These admonitions should be kept at the minimum consistent with not seriously damaging his health or life. Again an older person's feeling of dependence is increased by telling him directly or by implication that he is not wanted in the home, that he is being tolerated there, or that he should be happy that his family is making such a sacrifice to give him a "good" home. The aged person should wherever possible maintain his own residence to avoid such emotional strains.

The need for achievement is closely connected with employment and other work or activities such as hobbies in which the older person may engage. Failure to attain some degree of success in such outlets leads to maladjustments or more severe reactions.

Again the need for recognition and approval is tied in with accomplishment and usefulness. Whenever the older person does enter into activity, he should be complimented by those about him. If the only accomplishments he can point to are those of the past, hear him out even though the story has been heard many times before. He should be complimented on past achievements as well as present ones.

It is hard to surrender our place of activity in a fast moving world, to accept the fact we are deteriorating physically, that we are less alert, that we cannot concentrate as we did before, that we forget recent events to our embarrassment, that we are resistant to change—and still retain our self-esteem. The family and those about the aged person must make every effort to help him meet his other psychological needs in order that he may retain his self-esteem.

In dealing with an older person, all the psychotherapists, including psychiatrists and other physicians, ministers, professional counselors, social workers, volunteer social workers, employers and the family, must take an optimistic attitude toward him. They should emphasize the compensations of getting older. These are: (1) accumulated wisdom; (2) ability to balance the new against the old and to give advice; (3) the wealth of experience they have to draw upon, and (4) the value of leisure time.

Let us consider now the attitude which the older person must take toward old age if he is to adjust well in the family setting or its substitute. He must be brought to accept the fact that he must lead a balanced life. In other words, he must accept the fact that as he grows older the proportion of his time spent at work must decrease and the time spent in resting and sleep must be greater, as must be the time spent in recreation, hobbies, and just plain leisure. He must be brought to realize that the world and the ways of life are constantly changing and that the changes are more rapid now than when he was a youngster. Even then, as now, the ways of the grandchild seemed queer or even wrong to grandparents.

He must be led to realize that he must relinquish his control over his children and that the control of the grandchildren in the home is the problem of the parents, not the grandparents. The aged must be brought to look at old age as an opportunity to do new things and things he always wanted to do. He must learn to delegate responsibilities in his work and to prepare to give it up at least to a large degree.

Not all older persons can be brought to accept these attitudes, but many can. Oftentimes other persons than members of the family and the employer may be able to accomplish the engendering of these attitudes more effectively than those immediately concerned with him.

The matter of getting older folk to be active is worthy of some further consideration. Activity *now* should be encouraged rather than contemplation of past experiences and present problems. Participation in women's clubs, clubs for men, hobbies including gardening, travel, collecting, radio, and the like, are possibilities. Interest in sports such as golf, bowling on the green when available, and spectator's sports may be fostered. This "push to activity," as it is often called, must be carried out under careful guidance. There is danger involved if some degree of success is not attained. As Barker[2] has pointed out, "When we excite our older patient to activity, physical, mental or social, the occupation recommended must be one that can be carried on with at least some feeling of success and without fatigue or exhaustion. Failure is only too likely to affect a patient dangerously. When the right occupation is found, the physician must watch the effect carefully, continuing, increasing, or diminishing the activity as seems best for the patient's welfare." The family and others may well aid the physician in this guidance if they are tactful.

Industry must recognize its responsibility to the older person. It must employ more older personnel. In 1890, 74 per cent of the aged were employed. In 1930 only 58 per cent were employed. The recent World War brought about an increase in employment in this age group, but now it has again decreased. In fact at present it is difficult for a man or woman past forty years of age to secure new employment.

The latest war demonstrated the value of older experienced personnel, many of whom were recalled from retirement. The older person should be retained as long as is possible as a teacher or advisor. He should be made to feel that his suggestions are valuable and sought. Retirement does not necessarily eliminate one as an advisor. It is felt that private pension and industrial insurance plans should be broadened and improved.

The community—government—must not shirk its responsibilities to the aged. There is a tendency for local units to slough the responsibility for older persons to the state and federal government. There has been an increasing trend toward committing elderly persons to institutions as senile rather than toward encouraging families and local governmental units to assume the fullest possible responsibility for them. The best possible environment should be provided. While the care of the aged in the family setting has been stressed, it has to be recognized that this environment is not always the best one. At times a home for the aged is better, or again a nursing or rest home, or a county home. Some require care in a general hospital or a chronic disease hospital. Only when other care is not feasible should institutional facilities be employed.

Community centers for the aged providing suitable activities and guidance clinics should be fostered and developed. Their value has been demonstrated where they now exist.

Old age assistance plans are at present inadequate. We must provide the aged with the economic security to the fullest extent now possible.

It is the duty of medicine and its allied sciences to assist the aged person, his family, industry, and the community in every possible way in carrying out a program such as has been suggested. Its interest should not be limited to the individual brought to its attention but should be directed toward the vast problem as a whole.

Although it is true that the majority of the psychiatric problems of the aged may be classed as "minor," the matter of frank psychoses in the aged is rapidly increasing in size and importance. Whereas the minor disorders may usually be managed in homes, general hospitals and chronic disease hospitals, the psychoses as a rule require psychiatric hospital care. In fact, the increase in admission rates for such illnesses far exceeds the increase in population rates of this age group.[5] The accumulation of aged persons has become one of the most difficult and one of the largest problems of such hospitals.

Psychoses due to infection and exhaustion, to exogenous toxins, such as drugs (especially bromide) and alcohol, to endogenous toxins, to syphilis, to Parkinson's disease, and to brain tumor occur in old age, as well as in earlier life. Their recognition depends upon their always being kept in mind by the physician. They are often overlooked or misidentified. Their proper treatment obviously depends upon their recognition. Special care and skill are required in their management. The percentage of psychoses of first admissions falling in this group is quite small.

The two main groups of psychoses occurring in this epoch are those due to disturbances of circulation, i.e., psychosis with cerebral vascular accidents, psychosis with cardiorenal disease, and psychosis with cerebral arteriosclerosis and senile psychosis. Of those due to disturbances of circulation, approximately 94 per cent fall in the group psychosis with cerebral arteriosclerosis.

Psychoses due to disturbances of circulation account for about 10.6 per cent of all psychoses of first admission or about 14,000 such admissions per year in hospitals of all types in this country. Senile psychoses constitute about 7.8 per cent of psychoses of first admission or about 10,000 such admissions per year.

The early symptoms of psychosis with cerebral arteriosclerosis and senile psychosis have been described above under the term "mental aberrations." The hope from treatment lies chiefly in the proper therapy and management of the prodromal states. The clinical picture of psychosis with cerebral arteriosclerosis may be stated briefly as follows. As a rule the onset is gradual. Frequently physical complaints such as peculiar sounds or noises in the head, headache, dizziness, tremors, paresthesias, transitory apoplectiform episodes, epileptiform seizures and aphasia precede or accompany the psychiatric symptoms. The psychiatric symptoms may appear suddenly following injury, illness or an epileptiform or apoplectic seizure.

Emotional instability becomes marked. Uncontrollable outbursts of laughing or crying or of anger are often seen. Persistent depression and paranoid delusions as well as anxiety states may occur. Confusion, disorientation, and memory defects are common. Carelessness about clothing, body and toilet habits becomes marked. Abnormal sexual behavior of a severe nature may appear. The patient is often restless both day and night, and he may be given to outbursts of violence. Aphasia not infrequently complicates the clinical picture.

In senile psychosis, too, the mental aberrations become progressively more pronounced. Confusion, disorientation, memory defects, fixation of ideas upon bodily health and upon past events, confabulations and delusions of a persecutory, grandiose or bizarre nature present themselves. Reversal of sleep rhythm, untidiness, incontinence and abnormal sexual behavior are common.

These two types of psychosis are often indistinguishable from one another clinically and pathologically. Patients with well-developed clinical pictures may present only minimal pathological changes. Again the reverse is often true.

The treatment of the prodromal stages has been stressed. When the frank mental disorder appears, hospitalization usually becomes necessary. Careful attention to physical illnesses and defects, adequate nutrition, attention to elimination, occupational therapy and proper institutional environment are important. These patients should be cared for in one-story buildings especially designed for their use. All activities should be geared to a tempo suited to them. They should not be subjected to the pressures of the more active wards of the hospital. All employes concerned with their care must be aware of the physical and mental limitations of such patients and must be very tolerant and understanding of them.

Studies have been made to determine what happens to patients in these two classifications after admission to mental hospitals. For example, Camargo and Preston[3] reviewed 683 psychoses of first admission, each of whom was over sixty-five years of age upon entering Maryland State Hospitals. They found that 85 per cent were classified as psychosis with cerebral arteriosclerosis or senile psychosis. They noted that 16.7 per cent died within the first month, 47 per cent died within the first year and 66 per cent died within three years after admission. At the end of three years 66 per cent had died, 10 per cent had been discharged and 24 per cent remained in the hospital. The duration of life of these patients was shorter than the average duration expected for the general population of the same age group.

Where the basic etiologic factor is irreversible changes in the brain structure, true recovery is not possible. However, where other physical factors and psychological and social pressures are the chief causative factors, recovery is possible. Palmer[15] pointed out that there is a group of patients diagnostically distinguishable from true psychoses with cerebral arteriosclerosis and senile psychoses only by the results of treatment in whom the prognosis is good. His study was based upon 123 cases legally committed to a mental hospital and diagnosed as psychosis with cerebral arteriosclerosis, or senile psychosis, after three or four weeks of hospitalization, general treatment and observation. He found that nearly 25 per cent achieved social recoveries and returned to their former occupations or to their homes. Palmer stressed the need to eliminate any infectious, toxic and exhaustive factors.

In addition to the types of frank mental disorders of old age considered, there remains a group composed of manic depressive reactions, late involutional melancholias, paranoid states especially with depressive features distinct from cerebral arteriosclerotic and senile psychoses with paranoid trends, and severe reactive depressions, in which the use of electroshock therapy is often of great value.

Gallinek,[9] Feldman et al[7] and others have described the methods of treatment, the contraindication and the results obtained. One may cite as an example of the results obtained Gallinek's[9] report of seventeen cases. Of these seven showed complete recovery, two marked improvement, one no improvement, and five recovery or improvement with subsequent relapse. The value of maintenance electroshock therapy in those who relapse was stressed.

Many articles have appeared in the literature concerning cardiovascular pathology in its relationship to electroshock therapy. Our own experience leads us to agree with the conclusions of Kalinowsky and Hoch,[10] and Rowe and Schiele.[21] There is some degree of risk in using this form of treatment in persons with normal hearts, and this risk is increased in patients with abnormal hearts. The status of the heart may be determined by an internist. However, the psychiatrist must weigh the cardiac risk against the psychiatric problem and determine on the basis of his knowledge of the psychosis and his experience with convulsive therapy whether or not electroshock treatment should be used. Experience has shown that patients with moderately severe cardiac disease can tolerate this form of therapy.

In the group of psychotics under consideration, the problem of differentiating between a true irreversible psychosis and one which has a reasonable outlook for recovery or marked improvement is more difficult than that of assaying the physical risks involved in electroshock therapy.

In advising the family or friends of an elderly patient who presents a psychiatric problem, the physician should keep the following points in mind: Guardianship should be instituted in some instances for purposes of controling the activities and the finances of the individual. This step should be taken for the patient's benefit, however, rather than for the benefit of his relatives. One should not be too quick to advise commitment to an institution. Consideration should be given to the possibility of providing adequate care at home, in a rest home, a county home, in a home for the aged, in a general hospital, or in a special hospital for the chronically ill.

It should be remembered that not every person who presents a psychosis for the first time in old age is suffering from a true cerebral arteriosclerotic or senile psychosis. The shortness of life after commitment should never be forgotten. The following things demand care in a psychiatric hospital: sexual acts which are not tolerable; marked untidiness, particularly of the body and in regard to urine and feces; paranoid delusions, especially where they center about individuals rather than groups and most particularly when these individuals are accessible to the patient; depression because of the danger of suicide; and intellectual deterioration when it has progressed to the point when the ability for self preservation is lost, or when it endangers the lives of others.

Summary

Certain aspects of the role of psychiatry in geriatrics have been reviewed. These included the scope of the problem of the aged, the factors involved in the production of certain of the less severe and of the more grave psychiatric problems of this age group, and the nature and management of these particular disorders.

Discussion

Dr. William H. Hengstler, St. Paul: Dr. Gardner has covered this field so well in his paper that I have not much to add except to express my personal appreciation of his presentation. It is extremely important for the psychiatrist to give intelligent advice to families as to what they should do with elderly fathers or mothers. The individual case cannot be decided by a textbook or by a fixed rule.

PARATHION POISONING

W. E. PARK, M.D.

Director, Division of Industrial Health, Section of Environmental Sanitation
Minnesota Department of Health

Minneapolis, Minnesota

PARATHION is one of the new organic phosphates which are finding so much favor as insecticides. It was developed by the Germans during the last war. Details of this chemical were taken to England and first reported in the British Intelligence Objectives Report in 1946.

Parathion is a synthetic chemical, diethyl-nitrophenyl thiophosphate ($C_{10}H_{14}O_5PSN$). Chemists in the United States were soon able to produce it in commercial quantities, and it has become recognized as a valuable weapon in the fight against insects. The name parathion was selected by the Inter-Departmental Committee on Pest Control. It has been marketed under such trade names as: alkron, aphamite, durathion, genithion, niran, par, paradust, parakill, paraphos, penphos, phos kil, planthion, thiondust, thiophos and vapophos and is now becoming quite widely used.

Parathion is a heavy, syrupy liquid which is usually dark brown in color. It is only slightly soluble in water, but is readily miscible with many organic solvents such as ethers, alcohols, acetone, carbon tetrachloride and animal and vegetable oils. It is quite stable in neutral or acid solution, but is rapidly hydrolized by alkalis and soaps.

Parathion is usually formulated as a wettable powder of 15 to 25 per cent strength which may be mixed with water for application as a spray. It is also sometimes formulated for application as a dust in 1 or 2 per cent strength.

Parathion has outstanding insecticidal properties. For cockroaches it is nearly twenty times as effective as DDT, and more than 200 times as effective as nicotine. When properly applied, it has no injurious effects to plants, but because of its low solubility in water, it remains for some time as an effective insecticide residue.

Unfortunately, parathion is also very toxic to warm-blooded animals and man. Animal experiments have indicated that ingested dosages of 2 to 10 mg./kg. of body weight are lethal. The toxicity for man has not been established, but it probably is of the same order. Parathion is readily absorbed through the skin, and near fatalities and deaths have been caused merely by splashing it on the skin and neglecting to wash it off promptly. It may also find entry by inhalation or by way of the gastrointestinal tract.

Because of its high toxicity, parathion is not suitable for home and garden use. It should only be used by large scale commercial growers or professional sprayers who are prepared to take all the precautions necessary. Warnings and details of protective measures are marked on the cans and packages by the manufacturers, who are well aware of its dangers.

The pharmacological action of parathion appears to be dual. One effect is stimulation of the parasympathetic nervous system. The other is an anti-cholinesterase activity. There appears to be an irreversible destruction of the enzyme cholinesterase. As a result of this action, acetylcholine accumulates and continues to stimulate the parasympathetic nervous system, producing effects resembling those of both muscarine and nicotine.

Signs and Symptoms

Common symptoms are excessive salivation, lacrimation and sweating, headache, dizziness, nausea, vomiting, abdominal cramps, diarrhea or constipation, tightness in the chest, shortness of breath, blurring of vision associated with a constricted pupil and difficulty in accommodating for distant vision. There may be bronchial spasm and pulmonary edema resulting from capillary dilatation and excessive glandular secretions into the bronchi and bronchioles. There may be spasms of the voluntary muscles or even convulsions. Excitement of the central nervous system may be followed by depression, loss of reflexes, coma and death by failure of the respiratory center. In some cases, death may be due to bronchial constriction and cardiovascular collapse associated with pulmonary edema.

Diagnosis

A correct diagnosis depends largely on knowing that the patient has had an exposure to parathion. If some of the above symptoms and signs are found, poisoning with an organic phosphate should be suspected. Ten c.c. of blood in citrate may be tested for cholinesterase. If cholinesterase is found to be considerably reduced, it is useful confirmatory evidence.

Treatment

Prevent further absorption by immediate washing of the contaminated area with soap and water if the mode of entry is through the skin. Empty the stomach by inducing vomiting, or wash it out with a stomach tube if the poison has been ingested. If there is dyspnea or evidence of pulmonary edema, the patient should be placed in an oxygen tent at once.

The most useful specific remedy is atropine, which blocks the parasympathetic effect on the heart and lungs. It should be given as early as possible after a diagnosis is made, and in doses of 1/75 to 1/50 of a grain. The atropine should be repeated every hour or so up to ten or twelve doses in a day if necessary to control respiratory symptoms and keep the patient fully atropinized. Dilatation of the pupils should be achieved. The atropine may be given intramuscularly or intravenously.

Atropine can completely protect the air way, but it should be remembered that if pulmonary secretions have accumulated before atropine becomes effective, it may be necessary to turn the patient upside down for drainage, or suck the secretions out with a catheter. The patient may be too weak to cough. Muscular weakness may be so great that he cannot even breathe. In such circumstances, artificial respiration must be carried on. Atropine does not control the muscular weakness nor twitching of the muscles.

Morphine, of course, must not be given. Some protection of the myoneural junction against the nicotinic effects of parathion is afforded by magnesium sulphate, which effect is believed to be due to the magnesium ion. The usual dose of magnesium sulphate is 10 to 20 c.c. of a 10 per cent solution given slowly intravenously.

The acute emergency lasts twenty-four to forty-eight hours. During this time, the patient must be watched continuously. After danger appears to be past, the patient must have several more days of absolute rest. Further contact with organic phosphates must be avoided for at least two weeks, as the patient remains very susceptible to further poisoning during this time. The explanation offered is that symptoms disappear when the body's supply of cholinesterase is only partly replaced. During this period of partial replacement, it takes very little parathion to destroy the small amount of cholinesterase which has accumulated and precipitate another acute attack.

So far as is known at present, recovery from parathion poisoning is complete with no residual complications. Chronic poisoning has not been encountered. Small repeated doses of parathion, however, may bring about depletion of cholinesterase, so that when symptoms do develop they may seem to be precipitated by an exceedingly small recent exposure.

Workers with parathion may request a supply of atropine for use in an emergency. There is danger in granting such a request. Atropine, if taken before exposure, will mask the symptoms. Workers, if given atropine, should be warned not to take it until after symptoms develop. They should be warned that if symptoms develop, they must stop work and seek help immediately and not depend upon atropine to protect them.

Manufacturers of technical grade parathion are well aware of its dangers, and have the facilities and trained personnel to handle it safely. The formulation of 15 to 25 per cent wettable powders for making spraying mixtures and the formulation of 1 or 2 per cent parathion dusting powders may be undertaken by small manufacturers who are not experienced in the handling of such toxic chemicals. Exposure of workers in these plants on the one hand and exposure of farmers, fruit growers, sprayers and airplane pilots on the other, are the concern of the industrial hygiene divisions of the various state and federal public health agencies.

Prevention of over-exposure is possible in carrying out the normal operations of formulating wettable and dusting powders, and applying the insecticide, if proper precautions are taken.

In the plant, careful planning of the operation so that the processes are as far as possible automatic and isolated is essential. General and local good ventilation must be provided. Adequate washing and showering facilities are required. It is also the plant's responsibility to provide freshly laundered protective clothing every day. The plant must carry out a proper training and educational campaign.

In general, the following protective measures should be carried out by all users of parathion and other organic phosphates.

1. Wear only protective clothing at work and such underwear and socks as will be changed and laundered daily. Protective clothing includes coveralls, rubber gloves, shoes, caps, goggles and a respirator.
2. If liquid preparations are used, additional waterproof material must be worn, such as rubber apron or waterproof cape and hat and rubber boots.
3. Protective clothing must be changed and laundered daily. Waterproof materials must be thoroughly washed in soap and water at the end of each day.
4. Careful washing of the hands and face with soap and water before eating or smoking.
5. Never eat, smoke nor chew in an atmosphere containing parathion, and keep all food and lunches where they cannot be contaminated.
6. Thorough cleansing of the whole body at the end of each shift by shower bath and liberal use of soap.

The respirator which is to date most satisfactory for general use is parathion respirator, Mine Safety Appliances Company, No. Cr. 49290. Replacement cartridges are No. Cr. 49293 and replacement filters are No. Cr. 49294.*

Airplane pilots applying spray and others applying parathion aerosols, and workmen preparing high concentrations or mixing the chemical with carriers other than water, should use full-face gas masks.

If an accident occurs, such as breakage of equipment, releasing a spray of solution onto the clothing, or accidental inhalation of dust or vapors containing parathion, the following steps should be taken:

1. Immediate removal of wet clothing and thorough washing of the affected part with soap and water.
2. Notify the plant doctor or patient's private physician of the exposure.
3. Send the worker home for compulsory bed rest for twenty-four hours or so.
4. Detail a relative or someone to watch him, who will notify the doctor if symptoms of poisoning occur.

If an accidental spillage of parathion liquid occurs in a plant, it should be cleaned up immediately by absorbing it in sawdust, and then bury or burn the sawdust. The floor where the spillage occurs should then be thoroughly cleaned using an alkaline solution.

If a powder containing parathion is spilled, it should be cleaned up with a vacuum cleaner and the contents of the cleaner burned.

Containers in which parathion has been shipped must never be used again. Metal containers should be punched full of holes and placed in a private disposal ground. Combustible packages should be burned as soon as emptied.

Further advice on protective measures is available from the Division of Industrial Health, Section of Environmental Sanitation, Minnesota Department of Health, University Campus, Minneapolis, Minnesota.

INTRAVENOUS ADMINISTRATION OF PARA-AMINOSALICYLIC ACID FOR STREPTOMYCIN-RESISTANT TUBERCULOSIS OF THE TRACHEA

Report of a Case

DAVID T. CARR, M.D., WILLIAM D. SEYBOLD, M.D., HERBERT W. SCHMIDT, M.D., and
ALFRED G. KARLSON, D.V.M.

Rochester, Minnesota

PARA-AMINOSALICYLIC acid (PAS) is a new antituberculosis drug which is effective against both streptomycin-sensitive and streptomycin-resistant tubercle bacilli. The following report of a case illustrates the efficacy of the new drug against tuberculosis due to streptomycin-resistant tubercle bacilli. It is of particular interest as most of the PAS was given intravenously to avoid the gastrointestinal irritation which usually develops when this drug is given orally.

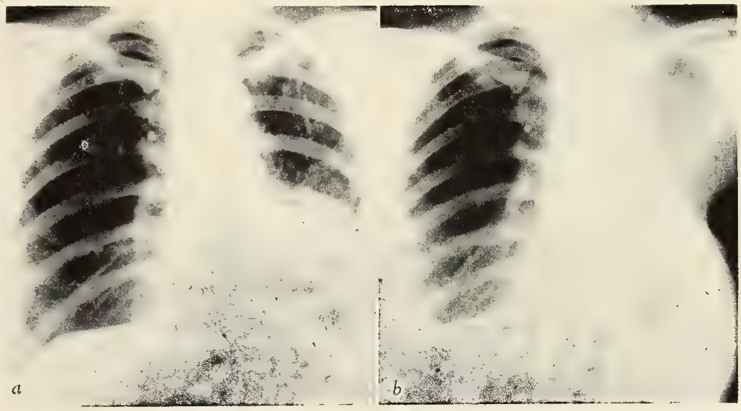

Fig. 1(a) January 25, 1949. Extensive disease is shown in the left lung before pneumonectomy. (b) August 23, 1949. The results of pneumonectomy and thoracoplasty are evident. Change had not occurred on the right side.

Report of Case

A white woman, thirty-two years of age, registered at the Mayo Clinic on January 24, 1949. A diagnosis of tuberculosis of the left lung had been made in January, 1948. She had entered a hospital where she rested in bed and also underwent therapeutic pneumothorax on the left side. In spite of this, tuberculosis of the left main bronchus and of the larynx had developed for which she was given streptomycin, one course of 1 gm. daily for fifty-five days and another of 1.5 gm. daily for one hundred and twenty-three days. The laryngeal lesion healed but the bronchial lesion persisted, producing stenosis of the left main bronchus. In addition, tubercles developed in the left side of the lower end of the trachea. Stained smears of the sputum remained positive for acid-fast bacilli throughout the period of treatment. Diagnostic study at the clinic revealed extensive disease of the left lung (Fig. 1*a*), stained smears of sputum being positive for acid-fast bacilli. Bronchoscopic examination revealed ulceration on the left side of the lower 3 inches (7.6 cm.) of the trachea. The lumen of the left main bronchus was stenosed to a pinpoint opening so that the depth of this bronchus could not be examined. The right main bronchus appeared normal.

In spite of tracheal disease and the probability that the tubercle bacilli were highly resistant to streptomycin, pneumonectomy on the left was advised. This was performed on February 1, 1949, and at the same time partial thoracoplasty was done, parts of the fifth, sixth and seventh ribs being removed. The immediate postoperative course was satisfactory and on February 17, 1949, a second stage thoracoplasty was performed, parts of the second, third and fourth ribs being removed. During this time she was given 1 gm. of dihydrostreptomycin each day even though it seemed probable that tubercle bacilli were resistant to this drug.

On February 22, 1949, bronchoscopic examination revealed persistence of the extensive ulceration in the lower end of the trachea, and stained smears of sputum were still positive for acid-fast bacilli. By this time it had been determined that the tubercle bacilli were resistant to steptomycin, the micro-organism growing in culture medium containing 100 micrograms of streptomycin per milliliter of medium.

Treatment with large doses of PAS was advised and to avoid the gastrointestinal irritation which this drug causes, the sodium salt of PAS (NaPAS)* was administered intravenously. On February 26, 1949, 4 gm. of NaPAS was given and the daily dose gradually increased until 30 gm. was being given each day. The total daily dose was added to 1,000 c.c. of 5 per cent glucose in distilled water and injected over a period of about eight hours. During the third month of treatment only 10 gm. of NaPAS was given intravenously each day due to an inadequate supply of the drug. This was supplemented by 14.4 gm. of PAS† administered orally each day in three equal doses. The total

Dr. Carr and Dr. Schmidt are with the Division of Medicine, Dr. Seybold with the Division of Surgery and Dr. Karlson with the Division of Experimental Medicine of the Mayo Clinic and Mayo Foundation, Rochester, Minnesota.

*The NaPAS was supplied by Cilag, Limited, Schaffhouse, Switzerland.

†The PAS was supplied by Dr. E. A. Sharp, Parke, Davis & Company, Detroit, Michigan.

TABLE I. CONCENTRATION OF PAS IN BLOOD SERUM AT INTERVALS DURING A PERIOD OF TWENTY-FOUR HOURS*

Hours after beginning injection	Concentration of PAS in blood serum (milligrams per 100 c.c.)	
	Free PAS	Total PAS
4¼	32.0	28.6
11	4.9	6.4
24	<1.0	<1.0

*In the first seven and a third hours the patient was given 30 gm. of NaPAS intravenously.

TABLE II. EXCRETION OF PAS IN THE URINE DURING A PERIOD OF TWENTY-FOUR HOURS*

Period of eight hours	Volume of urine, c.c.	PAS, gm. Free	Total
First	1,100	17.0	16.6
Second	1,100	7.0	8.0
Third	200	1.5	3.4
Totals		25.5	28.0

*In the first seven and a third hours the patient was given 30 gm. of NaPAS intravenously.

dose of PAS during the three months of treatment was 1,646 gm. of NaPAS given intravenously and 452.7 gm. of PAS by the oral route.

There was a dramatic response to this treatment. On March 23, 1949, a bronchoscopic examination revealed marked healing of the lesion in the trachea with only a small ulcerated area remaining just above the orifice of the stump of the left main bronchus. The ulceration extended down into this stump and was covered with a grayish-white exudate. Stained smears of sputum which had been positive persistently for acid-fast bacilli during the first month after pneumonectomy were now negative. However, cultures of sputum at this time proved to be positive for acid-fast bacilli.

After two months of treatment with PAS a bronchoscopic examination revealed complete healing of the tracheal ulceration. The orifice of the left main bronchus was slightly inflamed and bled a little when touched with forceps. A cultured specimen of the bronchial secretions obtained at this time did not show acid-fast bacilli to be present. After the third month of treatment had been completed, bronchoscopic examination did not reveal evidence of tuberculosis. The orifice of the left main bronchus appeared as a small dimple in the lateral wall of the lower portion of the trachea. The mucosa appeared normal but bled on bronchoscopic manipulation. Six specimens of sputum, gastric washings and bronchial secretion were cultured. Negative results were obtained from 5 cultures but 1 culture of sputum yielded a few colonies of acid-fast bacilli. During the three months of treatment the roentgenographic appearance of the right lung remained unchanged. At this stage of the treatment the patient left the hospital to continue rest in bed at home.

She returned to the clinic on August 22, 1949, for reexamination, having had no symptoms during the interval. A roentgenogram of the chest (Fig. 1*b*) did not show any change when compared with the film made in May, 1949. A bronchoscopic examination revealed no evidence of active disease. The stump of the left main bronchus still appeared as a small dimple on the left in the lower portion of the tracheal wall. The mucosa appeared normal and did not bleed on manipulation. No secretions were present. Bronchial washings were obtained for culture for acid-fast bacilli. Two specimens of gastric washings also were cultured. One of the gastric specimens yielded a few colonies of acid-fast bacilli but the results of the other 2 cultures were negative.

Evidence of toxicity to PAS was searched for carefully during and after the period of treatment but none was found. There was no sign or symptom of gastrointestinal irritation even when 30 gm. of NaPAS was given intravenously each day. The results of weekly blood counts, determinations of hemoglobin and urinalyses remained within normal ranges. Biweekly to monthly tests of renal and hepatic function showed no evidence of damage to the kidneys or liver. The prothrombin time varied from 19 to 23 seconds. There was some irritation of the veins with thromboses but it was possible to give the intravenous injection every day for 90 consecutive days.

The concentration of PAS in the blood serum and the excretion of PAS in the urine were studied* during a period of twenty-four hours in which the patient was given 30 gm. of NaPAS intravenously during the first seven and a third hours. The results are given in Tables I and II.

A streptomycin-sensitivity test was performed on each of the positive cultures for acid-fast bacilli. The microorganisms remained resistant to streptomycin throughout the period of observation. Sensitivity to PAS was also determined for all of the positive cultures. There was no evidence of increase in resistance to PAS, all of the cultures being sensitive to between 0.0045 and 0.072 mg. of PAS per 100 milliliters of culture medium.

Reexamination of the patient in December, 1949, revealed no evidence of active tuberculosis. Culture of three specimens of gastric washings and one specimen of bronchial secretions aspirated during bronchoscopy did not produce acid-fast bacilli.

Comment

It is worthy of note that a similar preparation of NaPAS was administered to two other patients by the intravenous route and in both cases acute hemolytic anemia developed after a few days of treatment. The preparation had been stored at room temperature for several months and analysis revealed that 24 per cent of the NaPAS had decomposed to meta-aminophenol and related compounds. For this reason it would seem wise to use only a freshly prepared solution of NaPAS for parenteral administration.

Summary

The sodium salt of para-aminosalicylic acid (NaPAS) was given intravenously in the treatment for a tuberculous ulcer of the trachea due to streptomycin-resistant tubercle bacilli which persisted after pneumonectomy. The ulcer was completely healed by the end of the three months of treatment, but gastric washings remained positive for acid-fast bacilli. The microorganisms were resistant to streptomycin and sensitive to PAS both before and after treatment. There was no untoward reaction to the medication except for venous irritation. However, a similar preparation of NaPAS given intravenously produced an acute hemolytic anemia in two other cases, probably due to partial degradation of the PAS to meta-aminophenol.

PSYCHIATRY IN GENERAL PRACTICE

S. G. EGGE, M.D.
Albert Lea, Minnesota

Case Presentation

THE patient was a forty-four-year-old white woman who was first seen at the office on August 16, 1949. Her chief complaints at that time were occasional dizziness, feeling of faintness, weakness and drawing sensation in both groins.

History revealed that she first noted dizziness about three months previously. She stated that she first noted her symptoms when she was sitting in church one Sunday and had gotten up quite suddenly. About three weeks before her symptoms had become more severe: the dizziness was much more marked, and the weakness, especially of the lower extremities, had developed. The patient stated that the difficulty in walking had become so severe that she would occasionally catch herself on a chair, table or the wall to prevent falling.

The patient was examined again at the office and it was felt that hospitalization was necessary, so admission to Naeve Hospital was arranged. While the patient was leaving the office she collapsed in front of the elevator and was found lying on the floor. She was apparently fully conscious, as shown by her response to questioning, but was unable to get up. After a brief examination which revealed no injury, she was taken to the local hospital and admitted September 26.

Past History.—The past history was essentially negative. She had had the ordinary childhood diseases but no serious illness or accident. She had had an appendectomy about ten years previously. The only significant finding in the past history was that the patient stated she had had a "nervous breakdown" while a student nurse about twenty years before.

Personal History.—The patient had completed high school (with difficulty according to the informant) and had started a nurse's hospital training. She stated she dropped out of high school in the second year because of a "nervous breakdown." The informant stated that she was obliged to quit because she had difficulty in her class work. Since that time she had been keeping house for her father who was a widower.

About eight months ago the patient's father remarried, and the patient stayed around home for a couple of weeks helping with the house work, but, for various reasons, she decided "to go out on my own." For the past six months she had been working at house work at several homes around her home town.

The patient mentioned on one occasion that she had a boy friend (aged sixty) whom she had been going with for several years. She stated that on several occasions he had made advances and she had refused because she thought doing such a thing was a sin when they were not married.

Family History.—Her father is living and well. Her mother died twenty-five years ago, the cause unknown. Two brothers and three sisters are living and well. There is no family history of serious organic disorders, of familial diseases, or of nervous or mental disease.

Physical Examination.—Physical examination revealed a well-developed, slightly obese white woman in no acute distress. She walked into the office with a slight staggering gait and fell into the chair with a thud. Her speech was somewhat thick. Her temperature was 98.6°, pulse 82, blood pressure 170/100. Examination of the eyes revealed that the pupils reacted slowly to light but were equal in size. Reaction to accommodation was normal. Extra-ocular movements were normal except that slight lateral nystagmus of both eyes was noted. Examination of ears, nose and throat was negative. There was no cervical adenopathy and the thyroid was not palpable. Breasts revealed no masses, chest was clear, heart rate was regular and there were no murmurs nor enlargement. The abdomen was soft with no masses palpable. There was a right lower quadrant scar. Liver, kidney and spleen were not palpable. No inguinal adenopathy was noted. Examination of the pelvis and rectum was negative. Extremities were normal with no deformities noted.

Neurological Examination.—Neurological examination revealed:

1. Pupils equal but reacted slowly to light. Examination of remainder of cranial nerves was negative.
2. Lateral nystagmus of both eyes was noted.
3. Reflexes: (a) Absent abdominal reflexes. (b) All reflexes were equal but slightly hyperactive. (c) Babinski's sign was negative. Chaddocks, Rossolimo's toe signs were negative. (d) Patient exhibited a positive Rhomberg. On asking the patient to stand she would fall backward with jerking movements into a chair.
4. The motor system was normal. There was no paralysis or paresis noted.
5. Sensibility—no paresthesias. Position sense, vibration sense and deep muscle pain were normal.
6. Tests for co-ordination revealed no abnormality. F to F and F to N tests were normal.

Mental Status.—1. Mental Content—Patient appeared rational and was pleasant to interview. One observation noted was the apparent lack of concern about her disability. She answered questions readily and accurately but when not spoken to would move her lips as if speaking to herself. A certain amount of mental

---

Presented at the staff meeting of the Naeve Hospital, Albert Lea, Minnesota, November 14, 1949.

History was obtained from patient and informants. Informants were patient's father and stepmother. Part of physical findings, diagnosis and therapy reported was taken from letter from Mayo Clinic.

preoccupation was noted. No delusions, hallucinations or paranoid trends were illicited.

2. Sensorium and intellect—Patient was well oriented as to time, place and person. Memory was unusually good. Informant stated that patient had an excellent memory and that if any of the members of the family wanted to know about any dates or past events, the patient could give accurate details. Patient's general knowledge was fair, and thinking capacity as evidenced by simple calculations was slow but accurate.

3. Emotional tone—Patient exhibited no evidence of depression or agitation. She did present a somewhat indifferent and apathetic attitude toward her illness.

4. Stream of thought—normal.

5. Attitude and manner—well dressed, natural and open—discussed problems freely.

Laboratory.—Usual laboratory work such as urinalysis, blood counts, et cetera, were normal.

A spinal tap was done the day after admission and was negative.

Hospital Progress.—During the ten days of the patient's hospitalization, her status remained unchanged; symptoms did not improve in spite of ordinary psychotherapeutic methods such as encouragement, reassurance and mild sedation.

A differential diagnosis of multiple sclerosis of psychoneurosis, conversion hysteria, tension state, was made.

After ten days hospitalization it was decided to transfer the patient to the Mayo Clinic at Rochester for further investigation and therapy. She was admitted to the neuropsychiatric service of St. Mary's Hospital October 11.

Following is an excerpt of a communication from the staff doctor at Mayo Clinic in charge of the patient:

> "Her general physical examination was essentially negative. A neurological examination revealed only a slight degree of horizontal and vertical nystagmus. This was considered to be of little significance with reference to her present problem since it was noted on a previous neurological examination in 1930. Her gait, though extremely bizarre, did not correspond to the disturbances seen with any ordinary neurological lesions. The nature of her gait plus her bland and somewhat indefinite attitude toward her symptoms strongly suggested the possibility of a severe neurotic reaction. She was seen in consultation in the psychiatric section and transferred to that section at St. Mary's for treatment. Her progress there has been somewhat slow. After repeated sessions under hypnosis her gait improved somewhat. It was noted, however, that her personality is so loosely organized and that her thought processes are often so illogical that she is unable to profit to any great degree from this type of therapy. Further observation has indicated that the patient is suffering from a severe conversion hysteria or possibly a schizophrenic reaction. A possibility of utilizing more heroic therapy such as electroshock treatments has been considered but the final decision has not yet been reached."

Patient was discharged from the neuropsychiatric service at the Mayo Clinic after about a month of intensive therapy with a diagnosis of "conversion hysteria, severe."

Therapy consisted of psychotherapy, occupational therapy, physiotherapy, and hypnosis. She made a satisfactory recovery, with complete return of function of her lower extremities, and is now on her own doing well.

Discussion

It is estimated that about 50 per cent of all patients coming to a doctor's office are suffering from some sort of emotional and tension disorder. In most of these patients we are not dealing with major mental disturbances but with some conflict or problem which is manifesting itself in a psychosomatic complaint. Most of us practitioners are so busy diligently searching for some organic or structural disorder that we fail to observe or understand some simple problem in personality which may be causing symptoms. We usually concentrate our attention on disease, paying little attention to the patient as a person. We oftentimes have little regard for the factors which make the patient an individual distinguished from his fellows. Oftentimes we see nothing more in a patient than the sum total of a disease which has certain detailed symptoms, etiology, prognosis, pathological anatomy and medical or surgical treatment. More often *the disease* has been overemphasized and the patient overlooked. It is true that tremendous strides have been made in diagnostic methods, in laboratory methods and in medical and surgical treatment, but these advances only seem to accentuate the tendency to forget the individual. The emotional life of the patient, his family life, his economic and social situations may be very essential factors in understanding the symptoms which he presents.

It is the purpose of this paper to present some of the factors which make up a total personality, to show how the personality reacts to stress normally and abnormally, producing neuroses, to discuss the etiology, diagnosis and therapy of the most common psychiatric disorder encountered in general practice and to try to present some helps in psychotherapy.

The general practitioner has several advantages over the psychiatrist in dealing with the common psychogenic illnesses. First of all, he generally sees them in earlier stages when they are more amenable to therapy; and secondly, he can approach the patient as a general practitioner rather than as a specialist. The general practitioner may sometimes have more rapport with the patient since confidence in him has already been established—in other words, he is the "family doctor."

Only a small percentage of neurotic patients will be or need be seen by a psychiatrist, and for that reason it is becoming increasingly apparent that a greater integration of basic psychiatric concepts be accomplished by the general doctor to take care of the "other 50 per cent" of his medical practice.

The study of man's mental processes has lagged far behind the study of his anatomical, physiologic and chemical processes. This is most likely due to the fact that the mental factors are less tangible and less amenable to measurement and manipulation. It is also possibly due to certain deep-rooted superstitions and dogmas which have held sway the past centuries.

Psychosomatic medicine has made rapid advance the past ten to fifteen years and is placing new emphasis on the psychic and emotional life of an individual. It recognizes that what patients do and feel are facts no less than are the physical conditions observed. Emotional reactions of love, fear, anger and hate are just as real as are the organs of the body and are capable of producing prolonged, disabling and almost intolerable illness.

A pathologic anxiety can cause far more suffering than rheumatic cardiac lesions or uterine fibroids which a patient may have.

Phychiatric illness afflicts the largest single group of patients. While they occupy more hospital beds than all other groups, most of them are not in mental hospitals but are frequenting physicians' offices presenting multiple psychosomatic complaints. The time demanded by these patients often can be reduced in the long run by effective and disciplined management. The common disorders, tension states, reactive depressions, involutional melancholias and other emotional disorders should be recognized as such, and therapy for actual mental illness should be instituted instead of treating for some non-existent organic disorder with diagnostic placebos.

The future of psychiatry lies not so much in the salvage of the one million patients that crowd mental hospitals but in the application of psychiatry to all patients.

From the physician's personal point of view, at least a cultural knowledge of psychiatry has something to offer in a more rational appreciation of his fellowmen, in human relations, in a better understanding and perspective of himself and possibly in the matter of some aid in his own personality development. Finally, there is something to be said for its downright interest, for a patient's mind can be as interesting as his colon.

At this point I will try to mention briefly some of the mechanisms involved in producing a neuroses.

Psychiatry believes that the neurotic patient is not just an unfortunate individual who is a victim of bad fortune but that he is a person who retreats into his illness through stages which can be studied and whose course can be predicted. Basically the personality of the individual is disturbed in some way. It is difficult to define personality but according to leading psychiatrists it is made up of five major factors. The first part has to do with the physical structure of the individual, the second deals with his biochemistry, the third with the great field of emotions, the fourth with his behavior, and the fifth part has to do with his mind. These five factors make up the "total personality." Emotions include fear, anxiety, jealousy, hate, anger, sex, love, courage, faith, et cetera. A person's behavior is adjusted either by public opinion or the laws of the state and country. It is true that what constitutes adjusted normal behavior today may be a maladjusted state of affairs tomorrow. The elements which make up the mind are constant: attention, comprehension, intelligence, judgment, memory, insight, stream of thought, sensorium, et cetera—the chief element being intelligence. Any disturbance of any one of the five factors making up the total personality will tend to upset the balance between the others and cause maladjustment.

A neurosis arises in a person as a result of his reaction to the stress to which he is subjected. The stress is either *internal,* i.e., conflicts arising from feelings of guilt, hostility or frustration; or *external,* i.e., trauma of war, shock, grief, economic threat or environmental difficulty. Factors of emotional maladjustment are generally more potent in reacting adversely to stress and any personality will break down if this stress is sufficiently great. Against stress is aligned the patients' mental stability which can be compared to the physical resistance to infections and which make up his emotional maturity. His hereditary assets, his physical health and the sum of all his earlier cultural and intellectual training are also important factors in the emotional stability with which he resists stress. When these factors are exceeded, the equilibrium fails and compensatory mechanisms that are basically neurotic are mobilized. Symptoms then appear and indicate that the defense mechanism or mental stability has failed or has exceeded what is generally regarded as normal bounds. The personality is then said to be sick. Help from relatives, friends, physicians or perhaps quacks and cultists may be sought in the patient's effort to restore a satisfactory balance. Another alternative is that he may continue to live his disordered life. Peptic ulcers or ulcerative colitis may develop, he may become an alcoholic or complain of multiple physical symptoms, seek unnecessary surgical procedures, change jobs, wives or physicians or even resort to suicide. Basically then, the patient either develops mental mechanisms such as evasion, regression, sublimation, projection, rationalization, conversion or repression to escape the stress situation and/or subconsciously develops some physical manifestation as his symptoms.

Perhaps the most common psychiatric disorder encountered in general practice is the anxiety syndrome.

The anxiety syndrome was first described by Hecker in 1893, but it was not until after World War I that it received general recognition in this country. It has been known by many other terms such as nervousness, neurocirculatory asthenia, spastic colon, nervous breakdown, nervous exhaustion, shattered nerves, shell shock, et cetera. The picture varies in the number, character and severity of the symptoms. Every person is basically anxious and the severity depends upon the underlying personality foundation of the individual. The anxiety syndrome usually occurs in an individual who is inclined to be tense, uneasy, with transient attacks of palpitation, precordial discomfort, perspiration, dyspnea, weakness and faintness. The patient may complain of difficulty in sleeping, of being easily fatigued, of constant headache and often of pressure on the top of the head or a band around the head. He may lose weight, be irritable and worry without knowing why. Examination will usually reveal a tense, restless, uneasy individual with cold, clammy hands and feet. The pulse rate may be increased, the abdomen tender to palpation and the deep reflexes overactive. The differential diagnosis begins with a very careful physical, neurological and serological examination. One should be absolutely sure that the individual does not have either some structural disease of his body or the central nervous system. The physician must be prepared to spend sufficient time in this to prove to himself and the patient that there is no organic disease. The anxiety state must be thought of as an exaggerated expression of the lack of function of the whole personality and treatment should be directed against those factors which are the cause. Attention should be paid to the environmental factors such as family difficulties, incompatabilities and worries. One should have a thorough understanding of the person's problems, his assets and liabilities. Engaging in a frank discussion of these problems and giving the patient an opportunity to express himself is a good form of therapy and is known as aeration, ventilation or mental catharsis. The initial interview should be adequate and lengthy enough so that the patient feels that the doctor is concerned and interested in his trouble. The patient should be told about the relationship of the symptoms to some underlying emotional difficulty, and it is important for the patient to be told that the symptoms are *not* imaginery but are the direct result of some emotional conflict. The wise use of sedatives plays a part in the therapy of the anxiety syndrome.

Lastly, I will try to summarize a few of the more common psychotherapeutic procedures and discuss briefly some of the methods used.

The approach to the patient must be passive, non-critical and in an interested manner. Don't immediately plunge into the depths of the patient's problem, because the instinctive reaction to this is one of defense and evasion. Don't begin by offering excessive or unwarranted reassurances. Don't be dominating or autocratic. Don't forcibly unwrap a patient without having some idea of his mental anatomy and and without knowing how to wrap him up again. As one psychiatrist put it, "Don't do a mental laparotomy and leave the incision gaping open." The neurotic personality has defenses that have been built up carefully which serve as a protection against the ravages of anxiety, guilt and fear. Patients are readily made worse if these defenses are abruptly knocked out before adequate supports have been set up to replace them.

The interview should be guided to economize on time and it is usually more satisfactory than pushing the interview.

Questions such as "Would you like to tell me about your difficulty?" invite the patient's co-operation and avoids the semblance of grilling. Direction of what appears to be significant facts in the history may be obtained by such comments as "I'm interested in this ——— that you mention." Then listen attentively, sympathetically and uncritically; the patient ultimately will display his real conflicts in vivid, enlightening detail.

Further points in conducting a satisfactory psychiatric interview would be: don't argue, don't try to substitute your standards for his own, don't accept the responsibility of making major decisions for the patient, and don't allow the patient to unload his responsibilities onto you. Approach the neurotic patient rather with a manner that displays at least as much interest as your approach to his roentgenogram or electrocardiogram.

Give him the assurance that you want to help him, and encourage him to take the initiative with the realization that at least half the responsibility in the treatment is his.

Listen to him—attentively, sympathetically, noncritically, without ridicule or amusement. Remember that his problems and symptoms are not absurb to him.

Sift and interpret, isolating what, on the basis of your understanding of mental illness, are the basic etiologic factors and mechanisms. Then gradually guide the patient back to a more mature way of dealing with his problems. Show him the probable relationship between his symptoms and his maladjustments and lead him out of his neurotic escape toward reality.

Consider the patient as a whole personality. This may temper the treatment of his disease in such a way as to not just add years to life but life to years. As one patient observed while struggling along on a particularly strict medical regime, "You don't really live longer—it just seems long."

In conclusion, let me say that there should be recognition, interpretation and treatment of the various personality disturbances that come to the attention of the general practitioner. There should be a better understanding of attitudes and facts in mental illness so that the general practitioner may gain a more wholesome understanding of life for his own sake as well as for those many patients with personality problems who come to him for aid. The general practitioner is intimate with the patient and the family of the patient; he constantly observes the family situations and the family usually turns to the family physician first for help. If the general practitioner would become interested, he is in a very excellent position to make a genuine and lasting contribution to the general mental health of the community.

Case Report

TREATMENT OF BARBITURATE POISONING WITH METRAZOL

J. S. MILTON, M.D., and J. L. STENNES, M.D.
Minneapolis, Minnesota

THE occurrence of poisoning from barbiturates is becoming increasingly common due to the greater use of these drugs and the greater ease with which patients find access to them, despite efforts to restrict their indiscriminate sale.

The following case of barbiturate poisoning is reported, not because of any new method of treatment, but because of the more persistent and successful use of metrazol which overcame the effects of the poisoning and resulted in a complete recovery of the patient. The case's history is as follows:

The patient, a white woman, aged thirty-four, was admitted to the Swedish Hospital on October 12, 1948, at 7:55 p.m. by ambulance. She was completely unconscious, both pupils were dilated, and there was poor muscle tonus. The blood pressure was 90/55, the pulse 80 and of good quality. On the basis of the history and of a previous occurrence of barbiturate poisoning, the present episode was immediately thought to be of the same character, perhaps due to sodium pentobarbital. It was impossible to determine whether the barbiturate alone had been taken, or a combination of barbiturate and amphetamine sulfate, which the patient was known to have used occasionally. It was equally impossible to learn what quantities of either or both of these drugs had been ingested.

During the first thirty minutes, 18 c.c. of metrazol were administered intravenously without any noticeable response. Five per cent glucose in saline solution was administered intravenously about half an hour after admission, and the inhalation of oxygen per BLB mask started. At various times the blood pressure dropped to 80/60 but was improved by the administration of 1 c.c. of adrenalin (1:1,000) solution intramuscularly. Following the initial dose of 18 c.c. of metrazol, doses of 3 to 5 c.c. of the same drug were given intravenously at frequent intervals so that at the end of the first twenty-four hours, 176 c.c. had been injected. During these twenty-four hours there had been only occasional, very slight responses indicated by changes in the pupillary reaction and occasional slight movements of the arms and legs while the metrazol injections were actually being given. At times the respirations became very shallow and the patient markedly cyanotic. Late in the day on October 13, the pulse rate had increased to 120 beats per minute, but the respirations remained at 18 to 20 per minute and were slightly deeper. During the evening of October 13, there seemed to be a great deal of mucus in the respiratory passages which was cleared by suction. At this time, penicillin therapy was begun and 50,000 units were administered intramuscularly every six hours. Supportive treatment was continued and about midnight on October 14 the patient began to respond during the time the suction apparatus was being used. The metrazol injections were continued at fairly frequent intervals during this entire period. About 2:30 a.m. on October 14, slight tremors and slight rigidity at the time of the administration of the metrazol became apparent. Perspiration during this time was profuse. After the recurrence of the tremors and the rigidity, the administration of metrazol was decreased and finally discontinued. About 9:30 a.m. on October 14, the woman became very restless and thrashed about in her bed. Shortly after this, she became rigid, with arching of the back, together with marked twitching of the face, extreme restlessness, and very much increased cyanosis. About 3:00 in the afternoon of the same day, a definite small convulsion was observed. At this time 100 mg. of demerol were administered. Following this the twitching and rigidity became less, although the restlessness persisted all afternoon. During the night she became relatively quieter and the cyanosis also decreased. The temperature had now risen to 102.2°, but the pulse was stronger. There was an occasional attempt at coughing when mucus seemed to obstruct the respiratory passages. About 4:00 a.m. on October 15, the patient spoke a few words and asked the nurse who she was. Shortly thereafter she called for her husband and responded slowly but poorly to questions. She seemed extremely depressed and the eyes presented a staring appearance. During the night she talked in a confused and irrational manner, attempted to pick up imaginary objects from the bed, and watched her nurse very closely.

The following morning further improvement was noted, although the cyanosis still persisted. The temperature now was 101°, the pulse 96, and the blood pressure 120/70. The patient appeared somewhat lucid and answered briefly when spoken to, although she still was very much confused. During this day, she took small amounts of liquid nourishment, and the following morning, October 16, at her regular meal apparently with enjoyment. At this time she was much quieter, less confused and more co-operative, but later in the day the confusion again increased and there were auditory, visual and sensual hallucinations, and marked excitement when talking to her husband. On October 17, the woman was still confused, laughed and cried alternately, and did not sleep although she yawned a great deal. A number of times she tried to strike her nurse and attempted to get out of bed. On October 18, the improvement was quite marked, although the patient was still incoherent at intervals and apparently had occasional delusions and hallucinations. However, she was definitely quieter and much more co-operative than before. On this day she was transferred to a sanatorium where she remained six additional days. At the conclusion of this period she had apparently recovered completely from the effects of the barbiturate poisoning.

It is worthy of comment that from the time of the patient's admission into the hospital until the appearance of the convulsion, which occurred during administration of the metrazol, a total of 259 c.c. of this drug had been given over a period of less than three days.

We feel that this case again corroborates the conclusions drawn by Eckenhoff, Schmidt, Dripps, and Kety[1] that metrazol is a potent analeptic and that "the failure of the drug as an analeptic is too often associated

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY

Rochester, Minnesota

(Continued from March issue)

Mary Elizabeth Bassett (Mrs. Charles W. Bray) was from July 19, 1895, to February 28, 1896, an intern at the Rochester State Hospital. She was the eighteenth appointee to the medical personnel.

Mary E. Bassett was born at Beaver Dam, Wisconsin, on November 16, 1863, the daughter of Robert Lees Bassett, a native of New Haven, Connecticut, a bookkeeper by profession, and Mary Elizabeth Stultz Bassett, a native of Beaver Dam, Wisconsin, who before her marriage was a schoolteacher.

After graduation from the high school at Hastings, Minnesota, as salutatorian, in June, 1882, Mary E. Bassett was a bookkeeper for seven years. In January, 1889, she matriculated at the University of Minnesota and in her four and a half years there she made a distinguished record. She was a member of Delta Gamma sorority and of Phi Beta Kappa; she received the degree of bachelor of science in 1893 and in June, 1895, was graduated *summa cum laude* with the degree of doctor of medicine. In December, 1895, by examination, she was licensed to practice in Minnesota.

On graduation from medical school Dr. Bassett applied for a hospital internship and, because she was a woman, received unqualified refusal in the hospitals of Minneapolis and St. Paul. She then came to Rochester to interview Dr. W. J. Mayo, in the hope of entering St. Mary's Hospital as an intern. Official internships had not yet been established at St. Mary's, but Dr. Mayo thought that she could obtain such a position at the state hospital and he helped her to do so. In her months in Rochester she did excellent work at the state hospital and made friends socially and professionally. On August 1, 1895, by unanimous vote, she became a member of the Southern Minnesota Medical Association. From Rochester she went as physician for six months to the Owatonna State School for Indigent and Dependent Children. From September, 1896, to March, 1899, she was assistant physician at the Minnesota Hospital for Insane at St. Peter.

Early in 1899 Dr. Bassett was married to Dr. Charles W. Bray (1868-1937), of Biwabik. Her husband was a graduate of the medical school of the University of Minnesota, in 1895, and for a time after graduation was associated in practice with Dr. F. H. Milligan, of Wabasha. The story of Dr. C. W. Bray's life as a citizen of Biwabik and of his work for thirty-eight years as head of the Biwabik hospital, which he established and owned, belongs to the history of medicine in St. Louis County. After her marriage Dr. Bassett Bray gave up active practice except that for several years she helped her husband with the hospital. In succeeding years, although her home and family were her primary interest, she was active in the Congregational Church, the American Red Cross, and community and county relief work. Beginning in 1937, she served as a member of the board of directors of the St. Louis County Health and Tuberculosis Association.

Dr. and Mrs. Charles W. Bray were the parents of five children, of whom one daughter, Rachel Lees Bray, died young. In 1945 there were living of the family group, Mrs. Bray, in Biwabik, and four children: Robert Bassett Bray, M.D., of Biwabik, head of the Biwabik Hospital; Elizabeth Bassett Bray, a high school teacher in Minneapolis; Philip Noyes Bray, M.D., gynecologist and obstetrician, of Duluth, during World War II a lieutenant commander in the United States Navy; and Kenneth Eben Bray, M.D., previous to 1941 in general practice at Park Rapids, during the war a major and flight surgeon in the United States Army Air Force.

Hiram C. Bear (1861-1931), member of a numerous, respected and long-established family of Olmsted County, practiced medicine from 1883 to 1890 in the village of Dover (then known as Dover Center) in the township of that name.

Henry Bear, grandfather of Hiram C. Bear, was one of the twelve children, several of whom settled in Olmsted County, of Samuel Bear and Mary Bricker Bear, natives of Pennsylvania and pioneer settlers of Ohio; Samuel Bear was an American soldier in the War of 1812. The parents of Mrs. Henry Bear were Adam and Catherine Bricker, both natives of New York and, like the Bears, pioneers in Ohio. William Bear, son of Henry Bear and father of Hiram C. Bear, was born in Seneca County, Ohio, on January 15, 1837, and came to Eyota Township, Olmsted County, Minnesota, in 1854. He was married in 1859 to Henrietta Carl, a native of Logan County, Ohio, and a daughter of Hiram Carl and Susanna Bodkin Carl, both of whom were born in Ohio; Mr. and Mrs. Carl came to Olmsted County in 1877. Mr. and Mrs. William Bear had five children, named here in the order of their birth: William; Hiram C.; George, who died in infancy; John Buty; and Alice May (Mrs. Charles W. Hughes).

Hiram C. Bear was born in 1861 in Eyota Township, and in that vicinity and in the village of Eyota obtained his early schooling. He studied medicine at the Hahnemann Medical College of Chicago, from which he was graduated in April, 1883; his Minnesota license No. 886 (H), was issued on April 22, 1884.

Liked and respected, Dr. Bear was welcomed to Dover, the scene of his first medical practice. He was married to Minnie Smith, of Plainview, Wabasha County, on January 1, 1890. In the autumn of 1890 Dr. and Mrs. Bear removed to Caldwell, Kansas. On their return to Minnesota, early in 1896, they settled in St. Charles, Winona County, and there spent the remainder of their lives. Dr. Bear had a broad and successful practice in Winona and Olmsted Counties. He died in St. Charles on June 18, 1931. Mrs. Bear survived him eleven years, and died in St. Charles on June 15, 1942.

Rose Anne Bebb, daughter of William G. Bebb and Margaret Price Bebb, was born at Portage, Wisconsin, and after early school years was educated at the University of Minnesota, receiving the degree of bachelor of literature in 1891 and the degree of doctor of medicine, *cum laude,* in 1897. On graduation in medicine she joined the staff of the Rochester State Hospital, the twenty-first professional appointee. On the resignation of Dr. Sara V. Linton Phelps, in February, 1898, Dr. Bebb became assistant physician and gynecologist, a position which she held until she resigned on March 3, 1900, to remove to New York, New York.

On arrival in New York she was invited to join the New York City Department of Health. Interested in preventive medicine, she accepted the offer and devoted some years to public health work in association with that department and other city health departments and with the United States Public Health Service. She also did research and teaching in this field at New York University. Later she resumed work in psychiatry and neurology, after two years of postgraduate study in these subjects in Europe. Much of the time subsequently she acted as consultant to private organizations and had her own institution for preventive treatment for mental disorders, with her office for years at 20 Fifth Avenue, New York. Since January, 1929, she has been associated with the New York City Department of Hospitals as a psychiatrist (1946).

Dr. Bebb has licenses to practice in three states, Minnesota, New York and Washington. While in Rochester, Minnesota, she was a member of the Olmsted County Medical Society and the Southern Minnesota Medical Association. She is a fellow of the New York Academy of Medicine (New York City), a member of New York state and county medical societies, the New York Neurological Society and the American Medical Association. She is a Presbyterian, a Republican, and a member of Alpha Phi sorority.

Dr. Bebb has recalled with pleasure her experience in the Rochester State Hospital, the interesting work and congenial associations, and has expressed gratitude to Dr. Arthur F. Kilbourne, superintendent, for opportunity and encouragement, and to Dr. William J. Mayo, who was a surgeon to the hospital at that time, for personal help and inspiration.

Edmund Beckwith, homeopathic physician and surgeon, came from Cleveland, Ohio, to Rochester, Minnesota, in January, 1868, as successor to Dr. Isaac M. Westfall, a pioneer homeopathic practitioner who was retiring from practice to devote himself to farming and dairying near Rochester.

Eckman, in 1941, in his essay, *Homeopathic and Eclectic Medicine in Minnesota,* reported that Edmund Beckwith was born at Nelson (in Portage County), Ohio, on October 14, 1836, and was graduated from the old Homeopathic Hospital College of Cleveland in 1865, and he presented the interesting speculation that Dr. Beckwith may have come from a distinguished background in homeopathic circles in Ohio: Dr. Seth R. Beckwith (1832-1905), a native of Ohio, was professor of surgery, before 1870, at the homeopathic college from which Edmund Beckwith was graduated, was one of the founders of the Pulte Medical College of Cincinnati, and was a practitioner who attracted eminent patients, among them James A. Garfield. Dr. David H. Beckwith (1825-1909) was professor of sanitary science at the same Homeopathic Hospital College, president of the Ohio state and the Cleveland city boards of health, and vice president of the Cleveland Medical Library Association.

Whatever his forebears, Edmund Beckwith practiced medicine in Rochester from January, 1868, into the autumn of 1872, and won liking and respect as physician and citizen. When he opened his office in the Union Block, on Broadway and Third Streets, his professional card stated that he made a specialty of all chronic diseases of the throat, lungs and liver, dyspepsia and the diseases of women and children. His home was at the corner of Franklin and College Streets (now Second Avenue, S. W. and Fourth Street, S. W.).

Favorable recollections of Dr. Beckwith by one of Rochester's venerable citizens have been confirmed by comments printed in the city newspapers of that day, as in the *Federal Union* of March 27, 1869:

> I desire, through this public medium, to convey my thanks to those friends who came forward with their kind proffers of assistance during the late affliction that befell my household. And also to tender my special thanks to Dr. Beckwith. I have now been the head of a

household during a period exceeding 38 years and the truth compels me to say that Dr. Beckwith is the first physician whom it has been my fortune to employ, during that entire time, who has offered essential relief to the afflicted members of my family.

J. M. Hall

And the *Rochester Post,* on March 25, 1871, bore this testimony: "Olmsted County is Homeopathic, nowadays. Dr. Beckwith, of that faith, was appointed county physician at the last session of the Board of Commissioners."

Dr. Beckwith allied himself with the Minnesota State Homeopathic Institute (founded in 1867) soon after he came to Rochester; at a convention held in St. Paul in June, 1871, he was appointed a member of two committees, one on the diseases of children and the other on contagious diseases. The next year, in June, at the annual meeting in St. Paul, he was appointed a member of the board of censors. In the meantime, in October, 1871, the Southern Minnesota Homeopathic Medical Society had been founded at Owatonna by a small group of practitioners, among whom were Dr. Beckwith and Dr. Westfall (the latter nominally retired from practice but active in organizational work). Dr. Westfall was elected president and Dr. Beckwith was made one of the board of censors and also designated to make a report on practices, at the next annual meeting, to be held in May, 1872, in Rochester.

In August, 1872, it was announced that Dr. Beckwith was leaving Rochester in the fall and going east; he had disposed of his business to Dr. W. A. Allen, of Plainview. In February, 1876, then in Muncie, Indiana, Dr. Beckwith was advertising in the Rochester papers that his residence in this city was for sale; it was not until October 8, 1886, however, that the *Post* stated, "Mrs. Dr. Beckwith has sold her former residence at the corner of College and Franklin Streets." In the autumn of 1878 Dr. Beckwith left Muncie for Faribault, Minnesota, having been appointed successor to Dr. Nichols in the "Deaf and Dumb and Blind Institute" in that city: "Dr. Beckwith is a worthy citizen and a skillful physician and the appointment is a good one." He was still in Faribault in late October, 1879.

Eckman stated that Dr. Beckwith removed to California, where he died, in Petaluma, on September 21, 1915, regarded as a pioneer practitioner of the town. The fact that Dr. Beckwith's name does not appear in the first official register of physicians of Minnesota, 1883-1890, is presumptive evidence that this physician left Minnesota before the medical practice act of 1883 went into effect.

M. D. Bedal, a graduate of the Chicago Medical College, opened an office in Leland's Block, on Broadway, Rochester, Minnesota, in June, 1874, having just completed three years in Cincinnati, Ohio, which he had spent attending lectures and practicing in the hospitals. The Rochester *Record and Union* stated, in the usual manner of early newspapers, that he was a young physician of superior attainments and excellent natural abilities. Evidence has not appeared that he remained long in Rochester. It is probable, judging from a note observed about early physicians of Mower County, that within a few months he proceeded to Brownsdale, and that in Brownsdale he omitted mention of his stay in Rochester, for it was said that he had come to Mower County from Cincinnati. From Brownsdale, in the spring of 1876, he removed to Tekamah, Burt County, Nebraska.

This Dr. Bedal should not be confused with Dr. Sylvester L. Bedal, who although never a practitioner in Olmsted County, it is believed, spent his boyhood in the county. The son of a pioneer settler near Eyota, Sylvester L. Bedal read medicine with Drs. E. C. and E. W. Cross of Rochester in the late sixties or early seventies. The only mention noted of him as a physician appeared in a local news item in

1874: Then an assistant surgeon in the United States Army, stationed in New York, he was visiting in Eyota.

J. S. Bell was a homeopathic physician and surgeon who came to Rochester, Minnesota, in September, 1868, from Naperville, Illinois, and opened an office over Andrews' store on Broadway; in January, 1870, he was changing his office to an upstairs room in Graham's Block. In the summer of 1871 it was stated that he had removed to the pretty town of Litchfield on the St. Paul and Pacific Railroad. Thereafter he made an occasional visit to Rochester.

That he was in good standing among organized homeopaths is indicated by the inclusion of information about him, albeit incorrectly, among homeopaths of Minnesota in the History of Homeopathy (1880) as follows: "Dr. J. S. Bell went to Rochester in 1869; went to Litchfield in 1873; left Litchfield in 1873." His departure from Litchfield is verified by an item in the *Rochester Post* of December 27, 1873, to the effect that Dr. J. S. Bell, formerly of Rochester, more recently of Litchfield, had been in Rochester during the week: "The doctor is seeking a more satisfactory and congenial climate."

Seth Scott Bishop, son of Lyman Bishop and Maria Probert Bishop, was born on February 7, 1852, at Fond du Lac, Wisconsin. He was graduated from the Pooler Institute, at Fond du Lac, and for three years studied at Beloit College. In 1869 he began the study of medicine with Dr. S. S. Bowers of his native city, thereafter attended three courses of lectures at the medical department of the University of the City of New York, and next enrolled at the Chicago Medical College, from which he was graduated in 1876. After practicing medicine in Fond du Lac for about a year, he decided to settle in Rochester, Minnesota, and in February, 1878, made the trip with horse and buggy, accompanied by his wife.

In Rochester Dr. Bishop took over the medical and surgical practice of Dr. St. V. Martinitz, an eclectic physician who was going to Austria to study, used Dr. Martinitz' office and lived near by. Both Dr. and Mrs. Bishop were talented musicians and entertainers; soon after their arrival Mrs. Bishop gave the first of several successful concerts, and in the same season she and her husband gave a demonstration at Heaney's Hall, exposing and explaining the tricks of spiritualistic mediums.

Established physicians of Rochester accepted Dr. Bishop as a colleague, and in 1878 he became a member of the Minnesota State Medical Society. When Dr. J. E. Bowers, superintendent of the hospital for insane, was away on a vacation, Dr. Bishop carried on his work for him. On occasion of consultation Dr. W. W. Mayo, of Rochester, and Dr. Franklin Staples, of Winona, endorsed Dr. Bishop's care of a patient.

In November, 1879, Dr. Bishop removed to Chicago, where as a specialist in diseases of the ear, nose and throat he won success and honor as surgeon and inventor of surgical instruments and therapeutic aids in that field, as writer, and as member of medical organizations (as recorded in *Physicians and Surgeons of America*, 1896).

Hamilton Philo Boardman, born in the late eighteen fifties, was the fourth child and third son of Philo Boardman and Jane Hackett Boardman, respected early settlers in Cascade Township, Olmsted County, Minnesota. His brothers were Elkanah W. Boardman and Marcus J. Boardman, his sister, Margaret Boardman (Mrs. William) Heaney.

Philo Boardman was born in Cattaraugus County, New York, on January 1, 1821, was educated in the public schools of Tioga County, and became a farmer and stock raiser. On May 5, 1855, he started for Minnesota with his wife and children; the family made the trip by ox team and wagon and arrived in Cascade Township on July 4, just in time to join the pioneer residents in celebration of Independence Day. Mr. Boardman took up a government claim in Section 15, a holding that he increased to 840 acres. After the death of his wife he remarried and, in 1879, removed to Texas, where he went into the cattle business. On leaving Olmsted County, he divided his land in Boardman Valley between his two elder sons with the understanding, it is said, that they would educate their brother Hamilton as a physician.

Hamilton P. Boardman acquired his preliminary education in the district and village schools and his first medical instruction from Dr. W. W. Mayo, of Rochester, with whom he studied in the late seventies. His formal medical training he obtained at Bellevue Hospital Medical College, in New York, from which he was graduated on March 1, 1880. In the following June the accidental death by drowning of Dr. John N. Farrand, of Oronoco, created a vacancy for a practitioner, and Dr. Boardman established himself in the village, with an office in the house of J. L. Hanson, and began his initial practice. To Oronoco at the same time came William A. Vincent, an undergraduate medical student employed at the state hospital in Rochester, purposing to hold a place in practice for his friend Edgar A. Holmes, of Eyota, Minnesota, who was about to take his degree at the Chicago Medical College. The *Oronoco Journal* announced on July 23, 1880, under the caption "And Still They Come," that all danger of death from lack of medical attendance was at an end, and called attention to the professional cards of the three young physicians.

At Oronoco it has been said, "Dr. Boardman was a very good doctor, able and fearless. He was very young, and a local boy. Dr. Holmes, older and an excellent physician, was here also and there were many well-established physicians in communities near. . . . Perhaps Dr. Boardman had more of the pioneer spirit than others—anyway, he left and went further west." His first remove, in October, 1881, was to Fisher's Landing, on Red Lake River, in Polk County, Minnesota, where he remained five years. On November 24, 1883, he qualified under the new Minnesota "Diploma Law" and received state license No. 401 (R); three days earlier he had registered in Dakota Territory. From Fisher's Landing he went, late in 1886, to Oakes, Dickey County, on the southern border of North Dakota, and there he found a widening field. After fourteen years of successful general practice he established his own hospital in Oakes, in 1901, enlarged it the following year and again in 1905.

Dr. Boardman was married in 1883 to Althea McMaster, a schoolteacher and one of the six children of Mr. and Mrs. John McMaster, pioneer settlers of Oronoco Township, Olmsted County. John McMaster was the son of William and Margery Cunningham McMaster, natives respectively of Westmoreland County and Fayette County, Pennsylvania; he came to Iowa in 1853 and to Minnesota in early 1856; his wife was Lawrence, the daughter of Andrew and Mary Lees-Hollister, natives of Scotland. Althea McMaster Boardman died in Oakes on March 24, 1903, leaving a son, Lees McMaster Boardman, about fifteen years of age. Dr. Boardman's second marriage took place in December, 1904, as noted by the *Northwestern Lancet* of January 15, 1905: "Dr. F. W. Maercklin, of Ashley, North Dakota, and Dr. H. P. Boardman, of Oakes, North Dakota, were parties to a double wedding last month. The brides were the Misses Anna Mabel and Martha M. Irwin, of Ellendale, in the same state."

Early in 1907, Dr. Boardman retired from practice and removed to California, first to Ocean Park and later to Santa Monica, where he died in 1925, survived by his wife and his son.

Wendell G. Bothwell (1844-1926), who has been described as a horse and buggy doctor of the old school, in the early spring of 1871 arrived with his wife and two infant children in the picturesque village of High Forest, Olmsted County. He found established there three physicians: Dr. Alexander Grant, inactive professionally; Dr. Stewart V. Groesbeck, popular, definitely a man of the people; and Dr. David S. Fairchild, well trained, very young and dignified and of highest ethical standing. The village having begun its long decline, in 1872, Dr. Groesbeck removed to Marshall, Minnesota, and Dr. Fairchild to Ames, Iowa.

Wendell G. Bothwell was born in Toronto, Canada, on November 10, 1844, the son of John and Adeline Maria Bothwell, natives of Scotland, who had come from Glasgow to Toronto. Around 1860 the family came west to Fond du Lac, Wisconsin, and there the boy became a baker. On the outbreak of the Civil War he joined the Union Army, with which he served until the close of hostilities. Within the next six years he obtained his medical education, and it is said that he read medicine in Rochester with Dr. Hector Galloway, who is recalled as one of the soundest of the pioneer physicians of Olmsted County. About 1868 he was married to Juliette Thomas, daughter of N. W. Thomas, a pioneer settler of Rochester; the second child of the marriage, Gertrude Bothwell, was born in Rochester in February, 1871. Although it has appeared in a medical directory that Dr. Bothwell was graduated from the Chicago Medical College in 1877, it is probable, judging from his story after he left High Forest, that he took his degree soon after studying with Dr. Galloway and that he was newly gradated when, in March, 1871, he began practice in High Forest A comment that he was in Pine Island and Goodhue some time in the early seventies has not been confirmed.

In High Forest and Rochester Dr. Bothwell is remembered as a pillar of the Methodist Church, a lively, jolly, friendly man, "quite a politician and something of a joiner." He was a member of many fraternal organizations, among them the Masonic Lodge, in which he was one of the Knights Templar, and the Independent order of Odd Fellows, and was medical examiner for various protective insurance associations. Although his practice in village and community kept him busy, it was not remunerative. A letter that Mrs. Bothwell wrote to her sister, Mrs. William Eaton, of Rochester, in the late spring of 1871, states: "The doctor has been practicing here three months and so far we have had fifty cents in money." Produce was almost too plentiful, especially when a ham weighing thirty-five pounds was brought in to apply on the doctor's bill, and ham was selling at ten cents a pound.

Juliette Thomas Bothwell died in High Forest in November, 1874, at the age of twenty-seven years, and shortly after her death, Dr. Bothwell with the two children, George, aged five years, and Gertrude, aged three years, removed to Fonda, Iowa. In Fonda, in October, 1880, he was married to Miss Ida Dodge of that place. Of this marriage there were two children, a son, Clyde Dee, born in 1882, and a daughter Helen, born in 1895. From Fonda

Dr. Bothwell removed with family in 1890 to Fairbank, Iowa, where he enjoyed many prosperous years. Gradually he discontinued medical practice and about 1916 left Fairbank for Des Moines, where for the last ten years of his life he was employed in the State House.

When Wendell G. Bothwell died in 1926, his funeral rites were conducted under the direction of the local chapter of the Grand Army of the Republic, of which he had been an honored member, and it is said that nearly all of the old soldiers in Iowa were present to pay him tribute. He was survived by his wife and by one daughter. Clyde Dee Bothwell, the son of the second marriage, was a graduate, in 1907, of the St. Louis (Missouri) College of Physicians and Surgeons and he practiced in Olwein, Iowa, from 1907 until his death on October 22, 1925. In 1945 there were living of Dr. W. G. Bothwell's family: his widow, Ida Dodge Bothwell, aged eighty-six years, in Des Moines; his daughter, Gertrude Bothwell (Mrs. J. T.) Dietz, at Fairbank, Iowa; and three grandchildren, George E. Dietz and Lewis Wendell Dietz, both in the service during World War II, and Mrs. J. A. (Dietz) Ohl, of Olwein.

Jacob Eton Bowers (1841-1922), for fifty-four years a distinguished member of Minnesota's medical profession in the field of nervous and mental diseases, was from January, 1879, to early October, 1889, a resident of Rochester, Olmsted County, as superintendent and chief physician of the Second Minnesota Hospital for Insane.

Jacob E. Bowers was born in 1841 in Berlin, Waterloo County, Province of Ontario, Canada, the son of parents who were natives of the state of Pennsylvania. He obtained his preliminary education in the schools of his birthplace and his academic training at the University of Toronto, from which he received the degree of bachelor of arts in 1864 and that of master of arts in 1865. In the next year he taught French and German at the London (Ontario) Collegiate Institute, and at the same time read medicine under a preceptor. Thereafter he spent one year at the Toronto College of Medicine and the next two years at the University of Michigan, from which he was graduated early in 1868 with the degree of doctor of medicine.

Soon after graduation Dr. Bowers came as assistant physician to the Minnesota Hospital for Insane at St. Peter (established in 1866) on the invitation of Dr. Sanuel E. Schantz, the first superintendent of the institution. When Dr. Schantz died suddenly in August, 1868, Dr. Bowers was appointed acting superintendent and so well did he manage the hospital and prepare the major part of the second annual report, for Dr. Cyrus K. Bartlett, the new superintendent who came in December, 1868, that the board of trustees allowed him full salary of superintendent. After he was relievd by Dr. Bartlett, Dr. Bowers spent several months in the East in postgraduate work. In 1876 and 1877 he traveled for eight months in Europe studying nervous and mental diseases and observing hospitals and asylums for the care of the insane. In June, 1877, he returned to his position of first assistant at St. Peter, where he remained until he came to Rochester.

Shortly after enactment of the law of March 7, 1878, which placed at Rochester the Second Minnesota Hospital for Insane (a brief history of the hospital appeared earlier in this article) and transferred to it the land and unfinished buildings of the nullified Inebriate Hospital, Dr. Bowers made his first visit to Rochester, as official representative of the board of trustees, to inspect the equipment and devise plans for adapting it to the care of the insane. The hospital opened on January 1, 1879, with Dr. Bowers as superintendent and sole physician.

To Dr. Bowers' ability as physician and executive and to his character as a humane and conscientious man were due the early growth and development of the Second Hospital for Insane into one of the finest institutions of its kind and time in the country. Dr. Bowers planned and began the beautiful landscaping of the hospital grounds, primarily for the benefit of the patients, and instituted as therapeutic measures entertainment, diversified activity and occupational therapy. His official annual reports to the board of trustees were not mere statistical compilations. Nearly sixty years after their writing they convey much of human and scientific interest.

The event that led to Dr. Bowers' resignation as superintendent of the hospital occurred on April 1, 1889, when a criminally insane Negro patient died, subsequent to a struggle with nonprofessional attendants. (At that time, for more than 850 patients, there had been allotted to the hospital only two assistant physicians.) There ensued criticism of Dr. Bowers and an exhaustive investigation that is a matter of detailed record in official documents. Newspapers of St. Paul and Minneapolis publicized the affair as a *cause célèbre.* Dr. Bowers was exonerated fully and his management of the hospital endorsed and sustained. When he resigned, he was replaced by Dr. Arthur F. Kilbourne, formerly assistant physician to the state hospital at St. Peter.

Before leaving Rochester to enter private practice as a specialist in nervous and mental diseases, Dr. Bowers was honored bv the citizens and the medical profession of the city, through the Olmsted County Society, of which he was then president. In this period also the Minnesota State Medical Society proposed a resolution of sympathy for and confidence in Dr. Bowers.

Dr. Bowers was a constructive exponent of organized medicine in various representative groups. In the Minnesota State Medical Society, of which he became a member on February 1, 1870, he served in many capacities, as corresponding secretary, member and chairman of committees, essayist, and delegate to the American Medical Association; in 1889 he was cited on the roll of honor of membership.

Jacob Eton Bowers was married on May 27, 1879, to Kate Walbank, daughter of Dr. and Mrs. S. S. Walbank, of Duluth. When they removed from Rochester, Dr. and Mrs. Bowers, after a few months in St. Paul, made their permanent home in Duluth. Sixteen years a specialist and more than thirty years an honored resident of the city, Dr. Bowers died in Duluth, at St. Luke's Hospital, on February 23, 1922, at the age of eighty-one years.

David A. S. Britts, a physician of the old school, typical of many of his time, first practiced medicine at Marion, Marion Township, Olmsted County, in the early seventies.

Born on March 1, 1844, in Montgomery County, Indiana, David A. S. Britts when a young boy removed with his parents to Wisconsin; in 1862 the family came to Dodge County, Minnesota. Soon afterward, on November 8, 1862, David Britts enlisted from Dodge County in Company M of the First Regiment of Mounted Rangers and with it served in the war with the Sioux Indians until December 7, 1863. After a period of detached service in a military hospital he re-enlisted on March 6, 1865, in Company K of the Second Regiment of Minnesota Cavalry, under General Henry H. Sibley, and again served in the Indian wars until he was mustered out on March 1, 1866. On his way home from Dakota in the winter he was injured so seriously by freezing that the government awarded him a pension. After his disharge from the army he attended school in Wasioja, Dodge County, at the famous old seminary, then the Groveland Seminary (shortly afterward, the Wesleyan Methodist Seminary), and thereafter obtained his medical training at the Chicago Medical College, probably subsequent to reading medicine with one of the well-known physicians of Dodge County.

In the summer of 1875, if not earlier, Dr. Britts began his medical practice at Marion, where he was successful, if newspaper comments are an indication. According to the *Rochester Post* of April 15, 1875, Dr. Britts announced to friends in Mantorville, Dodge County, that he had been appointed assistant room surgeon in one of the hospitals in Chicago and that he would begin the work about June 1; the next week it was stated that he would remain in Marion. Change was in his mind, for in July, 1876, he removed to Brownsdale, Mower County, where he remained until some time in 1880, with the exception of a few months in 1879 which he spent in Lanesboro, Fillmore County, as assistant surgeon at the "Lanesboro Sanitarium" of Dr. David Frank Powell (White Beaver).

Two different statements have been observed as to Mrs. Britts' maiden name: in the *Rochester Post* of November 28, 1879, there was announced the marriage on November 23 of Dr. D. A. Britts to Alice M. Stevens; in the *History of Mower County,* of 1844, the name appears as "Ella Stevens Hamlin."

From Brownsdale Dr. Britts went in 1880 to Clearwater, in Wright County. Under the Act of 1887 he received a state exemption certificate. Prior to 1904 he settled in Minneapolis, at 39 Washington Avenue South, and continuously from that time he was listed in directories as practicing medicine in that city; his name appeared in the first edition of the directory of the Amercan Medical Association, in 1906, and was included for the last time in the edition of 1914.

William P. Broderick (1859-1899), an assistant physician, twenty-second appointee on the staff of the Second Minnesota Hospital for Insane, to succeed Dr. H. H. Herzog, resigned, began his work in Rochester on March 25, 1899. He died suddenly in his quarters on April 8, 1899, from Bright's disease.

William P. Broderick was born on June 15, 1859, at Havana, Schuyler County, New York. In 1884 he was graduated from the Bellevue Hospital Medical College; the next seven years he was with one of the Manhattan state state hospitals on Ward's Island; the following eight years he was on the staff of the Northern Hospital for the Insane at Winnebago, Wisconsin, and from that institution came to Rochester. His wife had died in 1894, leaving a little daughter Lucretia, two years old. Dr. Broderick was survived by the child, a sister, Mrs. T. R. Palmer, of St. Paul, and a brother, George C. Broderick, of Norfolk, Virginia.

President's Letter

The AMA in 1950

The medical profession has outgrown many of its precedents. Chief among the discarded patterns is the familiar concept of the Family Doctor as a kindly, horse-and-buggy-propelled individual, whose only concern was the patients of his own community.

Perhaps I should not say that we have discarded this concept . . . for the ideals of service held by the horse-and-buggy doctor are an integral part of medical practice. But the medical profession has moved on to a wider perimeter of interest and to heavier and more varied responsibilities.

The history of the American Medical Association demonstrates this widening field of service. It has become increasingly active, over a period of years, in protecting the public against fraudulent and harmful medical practices, drugs, medicines and appliances. It has demonstrated a deep concern over the cost and availability of medical care; hence experimentation with the now accepted plans for voluntary health insurance and numerous studies into the equitable distribution of physicians. Ever-occupied with the necessity for higher quality medical care, the AMA has been instrumental in abolishing medical schools of inferior grade and tightening requirements for the remaining schools, until today there are *only* Class A medical schools. The American physician is the best physician in the world, with the most intensive training and education and the highest ethical standards.

Facts for Americans

In 1949 and 1950, the AMA has gone into the problems of medicine even more comprehensively. Committees have been sent abroad to study medical care plans; commissions have been organized, with AMA financing, to explore possible solutions to such problems as chronic and catastrophic illness. And to meet the challenge of knowledge-hungry, security-tempted Americans, the National Education Campaign continues. The Campaign, which gained sufficient momentum to block compulsory health legislation in the 81st Congress, will carry on the logical conclusions of the program—the possession, by every citizen, of the facts about medical care and costs, the easy transfer of control from medicine to all economy, the comparison of health standards under government medicine and private medicine.

Program Grows

To support its growing program of public service activities, the AMA has established twenty-five dollar dues. These dues have been set in a democratic fashion: no physician will be deprived of his county or state medical association membership through failure to pay AMA dues; affiliate members and those for whom dues-paying would constitute a hardship are exempted from payment.

The dues are far from excessive, particularly in view of their translatable value in human health, freedom and happiness. I feel sure that the physicians of Minnesota, in keeping with the traditions of medicine here, will maintain membership in the AMA, indicating by that membership that they support, actively and personally, the broad, humanitarian program of the American Medical Association.

President, Minnesota State Medical Association

AMA DUES FOR 1950

ESTABLISHMENT of dues for members of the American Medical Association has come as a surprise to many. Actually, the surprising fact is that the AMA has not required dues payment earlier in its 103-year history.

Physicians have been able to enjoy the privileges of American Medical Association membership without cost mainly because of the organization's multi-million-dollar publishing business. This enterprise has balanced the deficits and profits of at least ten medical specialty journals, the AMA Directory and the Cumulative Index Medicus, in addition to financing numerous costly public service activities, typified by Council on Pharmacy and Chemistry.

Doctor and public alike owe a great deal to the American Medical Association for its stewardship of medical standards and its protective attitude toward the nation's health.

As the economic, social and political life of America has become more complex, so have the duties and responsibilities of the medical practitioner and the organization that represents him to the public. The North Central area has contributed to the pressure for an expanded AMA program. More than a decade ago, the North Central Conference felt that the American Medical Association should interest itself more deeply in governmental affairs. Accordingly, the Washington office and the Council on Medical Service were established and the scope of both offices has widened during the years.

Currently, the American Medical Association is sending committees abroad to study medical education, hospitals and medical care plans, has established commissions for the consideration of such corrosive problems as chronic and catastrophic illness, and is conducting a campaign of national education to acquaint the American public with the facts about private and government medical practice.

If the American Medical Association is to continue to guard the public's health and, obliquely, its freedom, additional financing is necessary.

American Medical Association dues are payable now. Checks should be made out to the AMA and returned to the secretary of the *county* medical society, who will relay the dues to the state association office and from there they will go to AMA headquarters.

Payment of the dues is voluntary and does not affect membership in county and state associations, but like other obligations of democratic organizations, payment of these dues is the responsibility of every physician who is interested in maintaining medical standards and furthering the health goals of the nation.

THE STATUS OF VITAMIN CONSUMPTION

IN 1947, $188,000,000 was spent for vitamins in this country. The manufacture and sale of vitamins has thus become one of the great national industries.

The question has been raised repeatedly whether the millions spent yearly for vitamins have been wisely spent. Other questions which naturally have arisen in regard to the vitamins are: Is the average American diet actually deficient in vitamins and, if so, in which vitamins is it deficient? How can one determine the need of supplemental vitamins in the absence of clinical symptoms? If no avitaminosis exists, does the administration of additional vitamins serve any useful purpose and can it do harm?

An exhaustive review of the whole subject of vitamin supplementation in Health and Disease by Perry J. Culver appeared in the last three issues of the *New England Journal of Medicine* published in 1949. He answers the questions submitted above to his own satisfaction and with little room for criticism.

While admitting, of course, that there is such a condition as avitaminosis as for instance in chronic alcoholism, debilitating diseases associated with diarrhea (we assume) and in infants whose orange juice as well as milk is boiled, Culver questions the need for any widespread consumption of purified vitamin supplements by the public at large. He believes the average diet in America is sufficient to prevent clinical and subclinical vitamin deficiency and that there is very little vitamin deficiency in our country today. What there was ten years ago has been gradually disappearing and began to disappear before the practice of enriching flour began. He cannot explain this phenomenon and apparently does not believe the expenditure of millions of dollars for supplemental vitamins is responsible. He believes that many estimates of the incidence of vitamin deficiency in the United States have been based on the presence of supposed signs of vitamin deficiency which have been lately proven to be non-specific in character. He also believes that many claims that the American diet is inadequate are based on the consideration of the dietary allowance recommended by the National Research Council as minimal instead of optimal.

The author claims that very little evidence has been offered that supplemental vitamins added to the average diet do anything in the way of increasing fitness, increasing tolerance to heat or cold, improving well-being, reducing absenteeism from work, increasing appetite or ability to work.

In the last four years between three and four thousand medical articles on the subject of vitamins have appeared. Innumerable cases have been reported in which large doses of certain vitamins have cured a great variety of abnormal conditions. Oftentimes the therapeutic claims have not been substantiated by other investigators. Occasionally quackery has made its appearance, as in the case of the enthusiasm for Vitamin E in the treatment of heart disease. Shute, of London, Ontario, has been claiming improvement the last three years in 80 per cent of cases of angina pectoris, rheumatic heart disease, and hypertensive heart disease, from the use of Vitamin E; results which others have not been able to duplicate. Just recently the Council on Pharmacy and Chemistry (J.A.M.A., Feb. 18, 1950) has indicated the fraudulent nature of Shute's claims. Doubtless many of the claims for the therapeutic value of other vitamins will not stand the test of time and experience.

In the use of vitamins, the pendulum has swung far, and doubtless more are used than are warranted. Enormous doses can be harmful, but this probably seldom occurs. The pendulum will swing back and may have started its back-swing already. Let us not allow it to swing so far that we withhold the use of vitamins when they are indicated. An infant off the breast still needs supplemental vitamins. They are indicated when for any reason a diet may be lacking in vitamin content or absorption of vitamin is deficient. The therapeutic limitations of the newer vitamins—folic acid, B_{12} and rutin—is rapidly being determined.

The reality of sub-clinical avitaminosis and the impossibility of determining its presence frequently lead to the prescribing of a mixed vitamin pill, with a large question mark as to its need in the mind of the prescribing physician. The psychological value of such a prescription, however, is often very real, and vitamins have replaced Elixir I.Q. and S. Moderation in all things applies to the dispensing and consumption of vitamins. That we—both the public and the profession—have gone to inexcusable extremes in the matter of vitamins is certain.

ALAS, A LACK!

BESIDES the dearth of the teaching of the humanities in premedical education, there is practically a total loss of the aura of medical history in the medical school itself.

What is the result?

The junior professors and Fellows have lost sight of the humanistic values inherent in the past. Their task is piled up with the factual load of biochemical and mechanical aids to diagnosis; the spectre of research; the pressure from the Juggernaut press; and the "Boards." In other words, they have no time. They know nothing of the continuity of growth, its significance and its pedagogical value.

Lecturing on medical history to undergraduates may be a waste of time. In the selection of teachers, however, one of the requisites should be at least one essay by the candidate on some great physician of the past. A club or seminar for the study of history in this group is just as essential to the preparation for teach-

George Earl, M.D., Chairman

MORE AND MORE SECURITY MEANS "PIGGY-BACK" RIDE

Frank Dickinson, head of the AMA Bureau of Medical Economic Research, in a factual and convincing speech at the University of Wisconsin recently, scored the pending dangers of more and more government security. Citing simple facts and using them without distortion, Dickinson made a sensible argument against the security-extenders, asking the vital question, "Do we want to ride piggy-back to the grave on the shoulders of those who are now children?"

Explaining his contention that, with more security, those nearest the grave would depend on those nearest the cradle, he said:

> ". . . health progress is at once the measure and the core of social progress. Length of life is a comprehensive, rough measure of social progress—a quarter of a century in the heyday of the Roman Empire (for upper class Romans), a third of a century in Germany in 1700; life expectancy at birth was almost a half century in 1900 and almost three score years and ten in 1950 in the United States. Ruskin said it so beautifully, delightfully, in one sentence: 'There is no wealth but life.'
>
> "I would impress upon you the simple fact that, during the first half of the twentieth century, we have not only enjoyed man's greatest half century but we have also endured a social revolution—a social revolution more important than the fall of the Roman Empire, the Renaissance, the French Revolution, or the Industrial Revolution. This *latest social revolution* lies in the fact that the distance from the cradle to the grave is much longer for the average man. In 1900 there was no sentiment for 'cradle to the grave' schemes. Most of us living in 1900 were close to the cradle. Most of the people living today are far from their cradle days. This social revolution is the basis for the sentiment for 'cradle to the grave' schemes, as Sir William Beveridge called them; other people use different names. We are faced primarily with medical and health progress in half a century which have come so fast that we have difficulty digesting them into our social institutions and into our way of life. That, I submit, is the general problem. It breaks down into many specific problems."

He was talking about what sociologists call the "cultural lag"—the principle that, with rapid advancement of science and medicine, society is unable to absorb such developments into its social thinking with similar speed, resulting in an apparently backward social conscience. In reality, it is not backward social conscience, but scientific and medical advancement.

Cites Fifty Years of Health Progress

Health progress statistics since 1900 show with remarkable clarity how rapid the improvement has been. Itemization of fifty years of progress showed that:

> "One thousand babies born in 1900 were destined to live 49,000 years.
>
> One thousand babies born in 1949 were destined to live 68,000 years.
>
> Since 1900 the entire population of the United States has doubled. (75 to 150 million).
>
> Since 1900 the population age 65 and over has quadrupled. (3 to 12 million).
>
> The LOWEST state maternal mortality rate in 1933 was 4.3.
>
> The HIGHEST state maternal mortality rate in 1947 was 2.6."

Dickinson's main point was that society cannot cope with this improvement rate rapidly enough to suit the social planners. Those proposing more and more security for longer and longer periods, would force Congress into long-range and all-inclusive measures of the type which, they think, would bring America up to the present level of medical advancement. Dickinson declares:

> "It is the disturbing premise of the practice of medicine that the doctor cannot win. Let's say that when he saves a woman in childbirth he just adds her name to the list of potential victims of cancer years later. Let's say the patient saved is a laboring man with pneumonia; all the doctor does is to add one more name to the list of potential candidates for heart disease. The doctor

cannot win! Those who study these problems must come to understand the limitations on medical practice. They must understand that there are limitations on medical progress itself. The doctor can *only* change the age and cause of death. Medical care can never be adequate, despite the fact that the term 'adequate' is used by those who seek to decide who and how and where and why medical care will be provided.

"There is no adequate medical care for the family of a dying man. But the quest for better health, for longer life, for improved medical care will never end—it will go on and on. All that medical care can become is better. We are not talking about a black and white question. We are talking about a problem in which there are only shades of grey. We can only improve; we cannot perfect."

Dickinson concludes, saying:

"The fundamental question underlying all of this discussion today, as I see it, is simply this: What kind of a standard of social morality do you want in this country? That is the basic issue. Do you want this exploitation of youth, do you want to fasten yourselves on the paychecks of youth and ride piggy-back . . . to the grave, or do you want to pay your own way? Many years ago when we became old enough to vote, we faced a world in which we knew that there was ahead of us a lifetime of working, earning, and saving. . . . Do we want to press down upon the brow of our own youth this crown of security thorns? Health progress has given us the voting power."

SECURITY—FOR ALL?—FOREVER?

More security, for more people—even for babies who could theoretically retire at birth—is not beyond feasibility in the eyes of a clever economist. Writing to Charles E. Bradley, Ph.D., of the AMA Bureau of Medical Economic Research, he suggests:

"Every new-born child in the United States would receive from the Government a promissory note for $20,000 at 3 per cent interest, payable in 20 years.

"The 3 per cent would return $50 monthly to go to the child's parents until the child is 20.

"Each year during the 20 years, the Government would pay $1,000 into a sinking fund for the retirement of the note; and, when the child reached the age of 20, the Government would give him or her the $20,000 it had paid into the sinking fund.

"Boys and girls of 20 who elected to get married would thus have a capital of $40,000 to care for them, without work, for the remainder of their lives."

The writer carried this sort of thing much further, increasing benefits through government aids and schemes. Although exaggerated, his "dissertation" shows the extent to which his opponents, the socialistic planners, could carry their thinking. It sounds fine, full of years of "free" security, but in the practical application of the theory, would lead to a flagrant infringement on the rights of Americans to earn their own living, accumulate private property, and work out their own problems. Utopia such as suggested by this writer, is an actual insult to the American spirit of free competition. Its impossibility and impracticability is seen clearly in a definition from "The Comma": "Utopia: The conditions that will prevail when Americans enjoy 1949 wages, 1926 dividends, 1932 prices and 1910 taxes."

FOREFATHERS WARNED OF TOO MUCH SECURITY

Too much security means too much government spending; Americans are constantly giving more and more money to government, which in turn means less and less for the individual. Lincoln expressed it this way:

"Property is the fruit of labor; property is desirable; is a positive good in the world. That some should be rich shows that others may become rich, and hence is just encouragement to industry and enterprise. . . . Let not him who is houseless pull down the house of another, but let him labor diligently to build one for himself, thus by example assuring that his own shall be safe from violence. . . . I take it that it is best for all to leave each man free to acquire property as fast as he can. Some will get wealthy. I don't believe in a law to prevent a man from getting rich; it would do more harm than good."

Thomas Jefferson's agrarian philosophy included criticism of too much government interference and piling up of a large public debt. He said:

"I place economy among the first and most important virtues, and public debt as the greatest of dangers to be feared. . . . To preserve our independence, we must not let our rulers load us with perpetual debt. . . . We must make our choice between economy and liberty or profusion and servitude."

Another revered forefather recognized, too, that socialism is a doctrine of futility—an acceptance of mediocrity. Benjamin Franklin warned:

"They that can give up essential liberty to obtain a little temporary safety deserve neither liberty nor safety."

The Figures Show—

Gigantic government spending is now unprecedented. *The Journal of the Kansas Medical Society* quotes enlightening statistics on the scope of phenomenal federal budget figures compared to ordinary values:

> "If all the money in this bountiful nation was divided equally, your share would be $182.58. But your share of the national debt is $2,875.
>
> "If everyone in the United States cashed in all his life insurance policies it would bring in 44 billion dollars—less than enough to run our federal government for one year.
>
> "If every farmer sold his farm, his farm equipment and his livestock the total would be 25 billion dollars—less than enough to operate the federal government for seven months.
>
> "If Kansas sold everything at its assessed valuation and gave the entire proceeds to the federal government, it would operate our country a little more than one month."

Compared with our national income, the federal debt outstanding in 1929 equaled 19c for each dollar of national income for that year, according to the *Pittsburgh Medical Bulletin.* In 1939, the figure rose to 58c of debt per dollar of income. In 1949, the debt per dollar of income rose to the alarming figure of $1.15. And all this deficit has been incurred during years of relative prosperity. Common sense would seem to dictate that surpluses should be built up in good times, and that deficit spending to stimulate business activity should be reserved for poor times. If Americans are indifferent to the fact that government expenditures exceed income they may easily fall into what economist Edwin G. Nourse calls "the easy acceptance of deficit as a way of life."

Or in Terms of Time

This deficit spending situation is given added emphasis by a comparison, in terms of time, of free American and socialistic British values. The average American factory worker must work about 8 minutes to earn enough to buy five pounds of potatoes, or a quart of milk, or a package of cigarettes. In London, the average English worker must work 14 minutes for the potatoes, 19 minutes for the milk, and 1 hour and 20 minutes for the cigarettes.

Here are a few more items:

	America	*England*
3 lbs. sugar	11½ minutes	28 minutes
1 pair of overalls	3 hours	8¼ hours
20 gal. gasoline	3½ hours	15½ hours
1 pair of women's shoes	4 hours	16¼ hours

And yet intelligent Americans are being urged to adopt some plans similar to England's socialism. To-the-point comments on this comparison come from the *Pittsburgh Medical Bulletin:*

> "We American husbands are grateful, indeed, that we don't have to buy the little woman's shoes in England; it seems bad enough here.
>
> "Isn't it insulting to our intelligence and the intelligence of our laboring men to have our heads of government urge us to adopt the socialistic plans of England?
>
> "If wide publicity were given to the above statistics—in our newspapers, our union publications and trade journals, our government wouldn't have a chance of discarding our free enterprise system for socialism."

SHORT-SIGHTEDNESS MAY BE GREATEST DISADVANTAGE

The *Industrial News Review* has placed the emphasis in the right place by warning that there is great danger in a mere fight against socialized medicine, socialized grocery stores or the single socialization of any profession or business. It says:

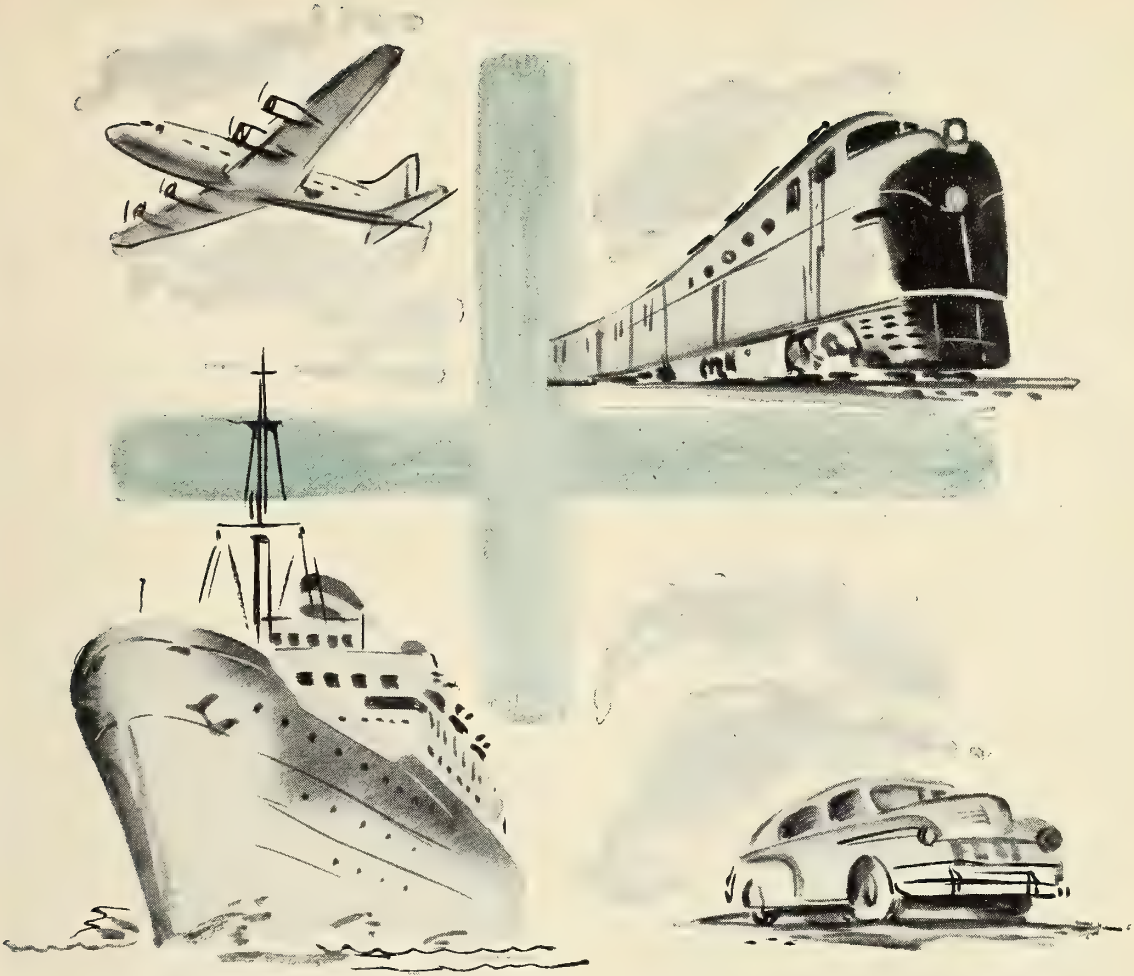
> "It may be that the greatest danger is short-sightedness. The man who runs a store may feel, for instance, that government ownership of some great industry, such as electric power, is of small moment to him. The man who works in a factory may see no personal menace in a law that would give the government broad controls over doctors. A labor leader may welcome more and more governmental domination of industrial leaders with whom he has differences. This is the way dictatorship comes about. One group is taken over at a time, while the other groups stand by and argue that it's no affair of theirs. Then, when it is too late, we find to our horror that we're all in the same boat. . . . The road to statism is marked with cheerful signs—human welfare, a better life for the masses of people, security against everything."

Divide and conquer is excellent strategy. It swallows its victims before they know they're bitten.

FEDERAL GOVERNMENT IS A BIG BUSINESS

The federal government is an ever-increasing competitor with free enterprise. According to Samuel B. Pettengill, columnist, radio commentator and former congressman, the government now operates light and power plants, builds and rents houses, "buys potatoes that rot and butter that turns rancid." In a speech delivered in Chicago recently, he enumerates government businesses:

(Continued on Page 388)



Airsickness, trainsickness, seasickness, carsickness—all respond to treatment with Dramamine (brand of dimenhydrinate.)

(Continued from Page 386)

"It is in the banking business, financing even such things as race tracks, beauty parlors and soda fountains.

"It is heavily in the insurance business for war veterans and their dependents.

"It is in the peanut, wheat, cotton, beans, turpentine, turkey and wool business.

"It owns at least two railroads, barge lines, merchant marine ships.

"It smelts metals, refines sugar, proposes to build steel plants.

"It operates scores of hospitals and hires doctors, dentists, oculists, and surgeons.

"It is in the business of fixing wages, pensions, prices, profits, interest rates and dividends.

"It proposes to finance public education from the kindergarten through college and look after everybody from the cradle to the grave."

It's a Question of Social Welfare

All this is done in the name of social welfare. Social welfare in itself is not particularly harmful. It is the method by which it is obtained that is of primary concern to all Americans who enjoy their freedom and want to continue to enjoy it. Many Americans have spoken out on this matter with wisdom and sincerity. Among them is Herman W. Steinkraus, president of the Bridgeport Brass company and spokesman for the United States Chamber of Commerce. Speaking on the Town Meeting of the Air on January 24, 1950, he said:

"I believe in social welfare, yes, but not government-owned, propelled, controlled social welfare. I believe in social welfare that doesn't choke the individual initiative; that places a responsibility on the citizens, on the community, and on the states; one where the federal government steps in to help only when private and local efforts are not enough; where money is given only when needed and not handed out to any group, regardless of their individual hardship or prosperity.

"The best thing we can do to give true social welfare to our people is to encourage thrift, give incentives for greater production and lower prices, to stimulate business growth and more job opportunities, to get our country on a sound financial basis, and let the dollar be worth a dollar. If we can't do it now, then when in heaven's name are we going to start?

"We all know the American system has given the greatest social welfare any people have enjoyed in the world's history. Socialism is the road to bankruptcy, a wrecked nation, and complete government control. The welfare state is on the same road.

"Remember what Lenin said in Russia: 'We shall force the United States to spend itself into destruction.'

"I say, let's be wise. Stop, look, and listen. Let's not believe government can do all these things for us without all of us having to pay for them and losing our freedom, too."

Saint Paul Woman Pays $500 Fine Imposed for Violation of Federal Pure Food and Drug Act

Re. United States of America vs. Carrie Grace Colwell, also known as Mrs. J. H. Colwell, trading as the Colwell Radium Company.

On February 23, 1950, Mrs. Carrie Grace Colwell, sixty-eight years of age, 257 Johnson Parkway, Saint Paul, Minnesota, paid a fine of $500 in the United States District Court at Saint Paul, Minnesota. Mrs. Colwell had been convicted by a jury on December 1, 1947, on four counts of violating the Federal Food, Drug and Cosmetic Act. On December 16, 1947, Mrs. Colwell was sentenced by Judge Dennis F. Donovan to pay fines totalling $500 and she was placed on probation for two years. The charge against Mrs. Colwell was that she had shipped drugs in interstate commerce that were misbranded and mislabeled. The charges grew out of the shipment of so-called "radium ore" that was represented as being efficacious in the treatment of cancer, tumors, poliomyelitis, Bright's disease, liver disorders and numerous other conditions. During the two years that Mrs. Colwell was on probation, she did not pay her fine. Accordingly, on December 15, 1949, her probation was continued for three additional years. On February 15, 1950, a warrant was issued for Mrs. Colwell's arrest for violating her probation by not reporting to the probation officer. On February 23, 1950, Mrs. Colwell paid the $500 fine. On March 6, 1950, Judge Donovan signed an order terminating Mrs. Colwell's probation.

ALAS, A LACK!

(Continued from Page 383)

ing as is their scientific requisite. Equipped with a knowledge of the past, the opportunity to impart this knowledge to the students at bedside clinics and conferences would enrich the student and stimulate him toward a more vital concept of his work.

The undergraduate of today is as much a hero worshipper as was the student of fifty years ago. He usually picks out, consciously or unconsciously, a member of the faculty whom he imitates as much as possible. If this professor has a cultural attitude in his teaching, the student will readily seek his fill of humanistic values. Without this cultural side of medicine, the danger to the young recruit might very well be that his practice will be mechanical, unhuman, depraved to a "business" level. The medical schools of today lack pitifully this fundamental in pedagogy.

Announcing . . .

The First
NEUROLOGIC CENTER FOR CIVILIANS
in the Northwest

Governor Luther Youngdahl formally opened and dedicated our neurologic center and opened the doors to the public on February 12, 1950, thereby offering the following new services:

1) treatment of the hemiplegic patient
2) multiple sclerosis
3) retraining of speech disorders
4) paraplegia and other paralyses
5) ataxias

Qualified neurologists and neurosurgeons staff this center. The staff also includes qualified personnel who have been trained in special therapy, occupational therapy, corrective therapy and physical therapy.

GLENWOOD HILLS HOSPITALS

3501 GOLDEN VALLEY ROAD MINNEAPOLIS 22, MINNESOTA
Offering a High Standard of Facilities for 25 Years

Reports and Announcements

STATE MEETING

The annual meeting of the Minnesota State Medical Association will be held in Duluth, June 12, 13, 14, 1950.

A symposium on "Advances and Investigation in Surgery of the Heart" and one on "New Advances in Treatment of Joint Disease" centering around cortisone, ACTH and gold salts will take place. Wednesday will be largely devoted to considerations of atomic energy, the afternoon being devoted to a conference on "Atomic Energy in War and Peace" open to the public.

The Northwest Pediatric Society is sponsoring Dr. Armand J. Quick, of the Marquette University School of Medicine, who will speak on "The Common Hemorrhagic Diseases of Childhood." The Arthur H. Sanford lectureship in pathology will be given by Dr. Ancel Keys, whose subject will be "The Diet and Cardiovascular Disease." Presenting the Russell D. Carman memorial lecture will be Dr. Eugene Pendergrass, Professor of Radiology at the University of Pennsylvania.

AMERICAN BOARD OF OPHTHALMOLOGY

Candidates for the certificate of the American Board of Ophthalmology are accepted for examination on the evidence of a written qualifying test. Applications are now being accepted for the 1951 written test and will be considered in order of receipt until the quota is filled. Practical examinations for acceptable candidates in 1950 will be held in Boston from May 22 to 26, in Chicago from October 2 to 6, and on the west coast in January, 1951. Further information can be obtained from the executive office of the board, 56 Ivie Road, Cape Cottage, Maine.

MENTAL HEALTH WEEK

With approximately half the hospital beds in the United States at any one time occupied by the mentally ill, and with at least half the patients of all physicians having complaints caused by or closely related to emotional difficulties, the medical profession has an important stake in National Mental Health Week, April 23-29, according to Dr. Burtrum C. Schiele, University of Minnesota Professor of Psychiatry.

An important development is the training of medical students in comprehensive medicine, with the integration of psychiatry and medicine of vital significance, according to Dr. Schiele. "All medical students should be aware of the possible relationship between life situations, personal factors and emotions in physiological upheavals and disturbances."

Mental Health Week is sponsored nationally by a broad group of organizations headed by the National Committee for Mental Hygiene, the National Mental Health Foundation, the National Institute of Mental Health, the American Psychiatric Association, and the Junior Chamber of Commerce. The Minnesota Mental Hygiene Society is co-ordinating activities within the state, with the assistance of the Minnesota Department of Health, the State Division of Public Institutions, and other state agencies.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The regular meeting of the Minnesota Society of Neurology and Psychiatry was held at the Town and Country Club, Saint Paul, on March 14. The scientific program consisted of the presentation of two papers: "Psychiatry in Geriatrics" by Dr. Walter P. Gardner, and "The Electroencephalogram in Brain Tumors" by Dr. Philip K. Arzt.

CRIPPLED CHILDREN CLINICS

The spring clinic schedule for crippled children, prepared by the Division of Social Welfare, Medical Services Unit, is as follows (clinics have already been held at St. Cloud, Austin and Detroit Lakes):

Place	*Date*	*Building*	*Counties*
Worthington	April 15	Grade School	Nobles Jackson Pipestone Cottonwood Murray Rock
Grand Rapids	April 22	Senior High	Itasca Cass
Thief River Falls	April 29	High School	Pennington Marshall Red Lake Roseau Kittson
Faribault	May 6	High School	Rice, Carver Goodhue, Scott Steel, Dakota
Brainerd	May 13	Franklin Jr. High	Crow Wing Wadena Mille Lacs Todd, Cass Aitkin
Morris	May 20	High School	Stevens, Grant Pope, Traverse Douglas Bigstone
Moose Lake	May 27	High School	Aitkin, Cook Carlton, Lake Pine
International Falls	June 3	Alexander Baker School	Koochiching Lake of Woods

COURSE IN ENDOCRINOLOGY

A postgraduate course in endocrinology will be held by the American College of Physicians at the La Salle Hotel, Chicago, Illinois, from May 15 to 20.

The course will provide an intensive review of recent developments in the field of endocrinology, devoting a considerable amount of time to the clinical uses of ACTH and cortisone and related steroids. Special attention will

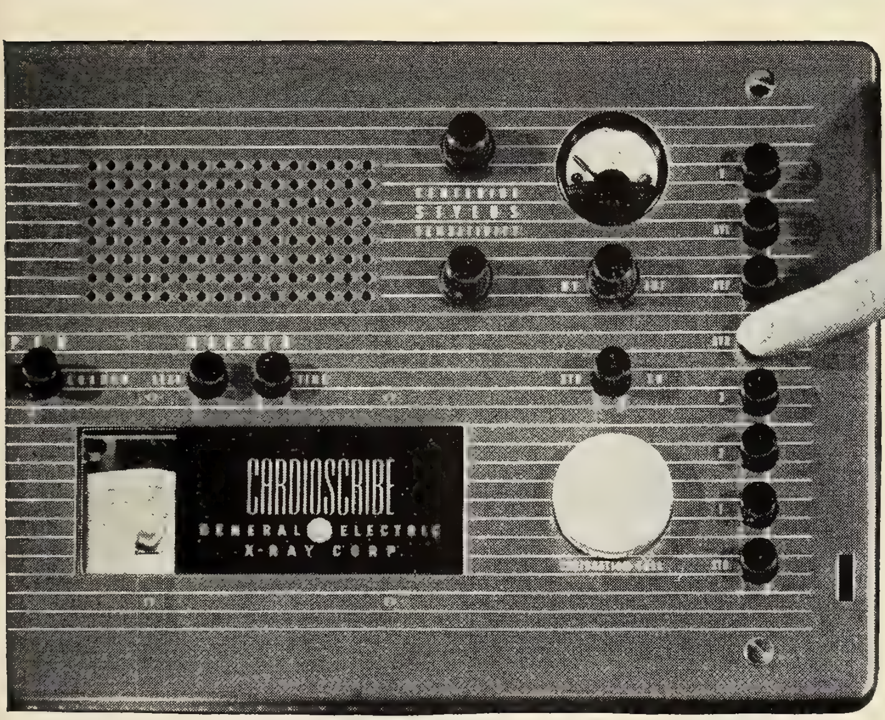
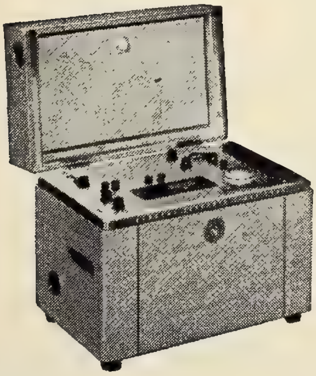
WITH CARDIOSCRIBE'S PUSH BUTTON CONTROL



High-Fidelity Heart Recordings



The General Electric direct-writing Cardioscribe, with its push-button control is destined to extend to new horizons the applications of electrocardiography. Of particular interest is its possible application in those situations where, in the past, it has been felt that electrocardiography was a too-involved and technical procedure for any but specialized applications.

Look what you get with the GE Cardioscribe!

- 7 push-button controls, make possible taking 17 separate leads, without regard to numerical sequence!
- Push-button switches!
- Ability to utilize *all* present day technics!

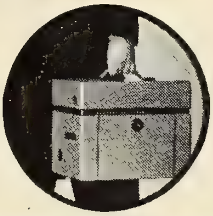
Ask your GE representative for a demonstration, or write direct to.

GENERAL ELECTRIC
X-RAY CORPORATION

Minneapolis ...... **808 Nicollet Avenue** **Duluth** .... **3006 West First Street**

No darkroom delay — Results are available immediately for interpretation as each lead is completed. No darkroom space, equipment or supplies required.

Independent time marker — A second, completely independent stylus is provided for indicating time and lead marks on the record paper.



Portability — Compact, and entirely self-contained in blond mahogany cabinet.

COURSE IN ENDOCRINOLOGY

(Continued from Page 390)

be paid to clinical disorders. Instructors from all areas of the United States and Canada will participate in the course, which will consist of lectures, round-table luncheon discussions and presentations of patients.

Fees for the course will be $30 for members of the American College of Physicians and $60 for non-members. Further information can be obtained by writing the director of the course, Willard O. Thompson, M.D., 700 North Michigan Avenue, Chicago 11, Ill.

CONTINUATION COURSE

A continuation course in proctology will be presented at the Center for Continuation Study of the University of Minnesota from May 22 to 27. Dr. George Thiele of Kansas City will be the visiting faculty member for the course and will discuss "The Relationship of Anorectal Diseases to General Medical Problems" and "Office Management of Common Proctologic Complaints."

Throughout the course, emphasis will be placed on anorectal and colonic lesions most frequently seen by practicing physicians. The presentation will be by means of lectures, operative clinics, motion pictures, and seminars. Faculty for the course will be made up of clinical and full-time members of the staff of the University of Minnesota Medical School and the Mayo Foundation.

SEMINAR ON PSYCHOSOMATIC MEDICINE

Three seminar lectures on psychomatic medicine in two Minnesota areas are scheduled for April—the month in which National Mental Health Week falls. National Mental Health Week is scheduled for April 23-29 and is sponsored nationally by a broad group of organizations headed by the National Committee for Mental Hygiene, the National Mental Health Foundation, the National Institute of Mental Health, the American Psychiatric Association, and the Junior Chamber of Commerce. The Minnesota Mental Hygiene Society is co-ordinating activities within the state, with the assistance of the Minnesota Department of Health, the State Division of Public Institutions, and other agencies.

Professional groups in the Mankato area will hear two lectures on mental health, one by Dr. Reynold A. Jensen, associate professor of pediatrics and psychiatry, and the other by Dr. C. Knight Aldrich, assistant professor of psychiatry at the University of Minnesota. On April 26, during National Mental Health Week, Dr. Aldrich will speak in the Austin area to physicians, dentists, nurses, and pharmacists.

Mankato's University of Minnesota postgraduate seminar for physicians started February 28. Physicians have been meeting at the Mankato State Teachers College Tuesday evenings at 7:45. Eight consecutive weekly sessions on heart disease, cancer control, and mental health have been scheduled, with the last one held April 25. Faculty members of the University of Minnesota School of Medicine and the Mayo Foundation for Education and Research have spoken to the medical group.

SEMINAR ON PSYCHOSOMATIC MEDICINE

(Continued from Page 392)

The Wednesday evening medical seminar at Austin started March 15 and will conclude May 10. St. Olaf Hospital in Austin has been the site of the eight weekly meetings.

The medical seminars in these two areas have stimulated other professional groups to develop programs devoted to heart disease, cancer control, and mental health as related to the specific professions. Dentists and nurses of Austin and Mankato areas have been meeting for sessions of their own, and then have been joining with the physicians for the last four medical lectures. Pharmacists have been invited to attend those lectures of any group which they feel are of most professional value to them.

Five of the seven seminars offered during the 1949-50 season have already been completed. Bemidji, Fergus Falls, Duluth, St. Cloud and Winona have held professional postgraduate education courses for personnel within their areas.

With the completion of courses now being currently held in Austin and Mankato Minnesota's unique education program will draw to a close this year. Projected on a five-year basis, the program is expected eventually to reach most Minnesota communities.

Seven Minnesota cities will be chosen for similar seminars next year.

Sponsors of the program for physicians have been the University of Minnesota School of Medicine, the Minnesota State Medical Association, the Minnesota Department of Health, and local professional organizations. Other sponsors are the Minnesota Division of the American Cancer Society, the Minnesota Heart Association, and the Minnesota Mental Hygiene Society.

Cook County Graduate School of Medicine
ANNOUNCES CONTINUOUS COURSES

SURGERY—Intensive Course in Surgical Technic, two weeks, starting April 17, May 15, June 19.
Surgical Technic, Surgical Anatomy and Clinical Surgery, four weeks, starting April 3, May 1, June 5.
Personal Course in General Surgery, two weeks, starting April 17.
Surgery of Colon and Rectum, one week, starting April 10, May 15.
Esophageal Surgery, one week, starting June 5.
Breast and Thyroid Surgery, one week, starting June 26.
Thoracic Surgery, one week, starting June 12.
Gallbladder Surgery, ten hours, starting April 24.
Fractures and Traumatic Surgery, two weeks, starting June 12.
Basic Principles in General Surgery, two weeks, starting, September 11.
GYNECOLOGY—Intensive Course, two weeks, starting April 17, June 19.
Vaginal Approach to Pelvic Surgery, one week, starting May 15.
OBSTETRICS—Intensive Course, two weeks, starting April 3, June 5.
PEDIATRICS—Intensive Course, two weeks, starting April 3.
Personal Course in Cerebral Palsy, two weeks, starting July 31.
Personal Course in Diagnosis and Treatment of Congenital Malformations of the Heart, two weeks, starting June 5.
MEDICINE—Intensive General Course, two weeks, starting April 24.
Electrocardiography and Heart Disease, two weeks, starting July 17.
Hematology, one week, starting May 8.
Gastro-enterology, two weeks, starting May 15.
Liver and Biliary Diseases, one week, starting June 5.
Gastroscopy, two weeks, starting May 15, June 12.

General, Intensive and Special Courses in all Branches of Medicine, Surgery and the Specialties.

TEACHING FACULTY—ATTENDING STAFF OF COOK COUNTY HOSPITAL
Address: REGISTRAR, 427 South Honore Street
Chicago 12, Illinois

FREEBORN COUNTY SOCIETY

At a meeting of the Freeborn County Medical Society in Albert Lea on February 23, the principal speaker was Dr. R. W. Ridley, Rochester, who spoke on newer developments in the field of anesthesia.

Society members reported at the meeting that $1,000 had been contributed to the Naeve Hospital equipment fund. The money had been earned by the society in a school immunization campaign last fall.

HENNEPIN COUNTY SOCIETY

Dr. Reuben F. Erickson, Edina, has been elected president of the Hennepin County Medical Society, to take office on October 2. He will succeed Dr. Robert F. McGandy in the post.

Other new officers of the society include Dr. William R. Jones and Dr. Robert E. Priest, vice presidents, and Dr. George N. Aagaard and Dr. Ralph H. Creighton, members of the board of directors.

RANGE MEDICAL SOCIETY

Dr. Gordon M. Erskine, Grand Rapids, was installed as president of the Range Medical Society at a meeting in Hibbing on February 28. Other officers of the society include Dr. J. A. Malmstrom, Virginia, vice president, and Dr. Robert E. Hansen, Hibbing, secretary.

WASHINGTON COUNTY SOCIETY

The monthly meeting of the Washington County Medical Society was held on March 14. Following dinner and a business session, two colored motion pictures, "Cardiac Arrhythmias" and "Animated Hematology," were shown.

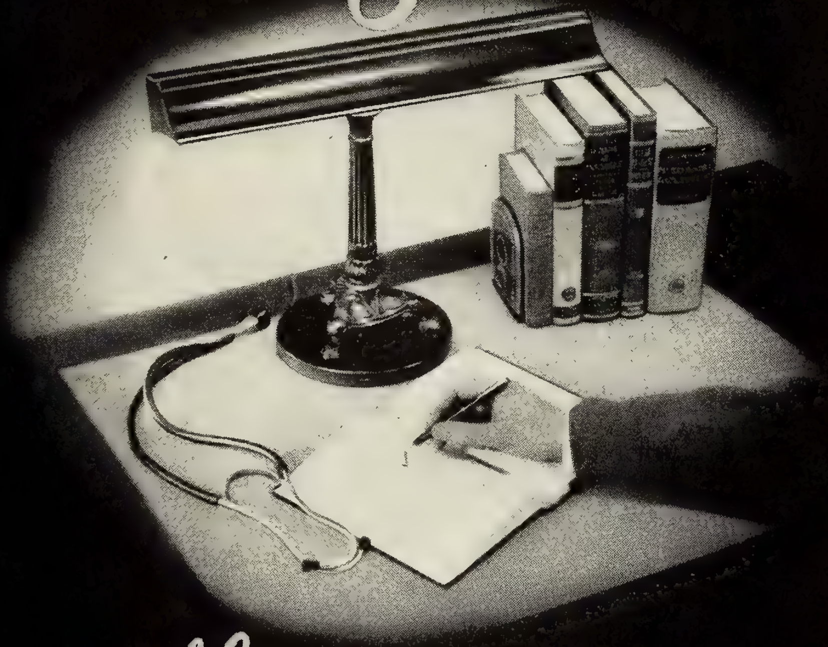
A LAXATIVE FOR *judicious* THERAPY



because **of its**

Authoritative Endorsement

Phospho-Soda (Fleet)'s* endorsement by modern clinical authorities stems in great measure from its gently thorough action—free from disturbing side effects. That, too, is why so many practitioners are relying increasingly on this safe, dependable, ethical medication for judicious laxative therapy. Liberal samples on request.

---

*Phospho-Soda (Fleet) is a solution containing in each 100 cc. sodium biphosphate 48 Gm. and sodium phosphate 18 Gm. Both 'Phospho-Soda' and 'Fleet' are registered trade marks of C. B. Fleet Company, Inc.

BIRTCHER

BLENDTOME

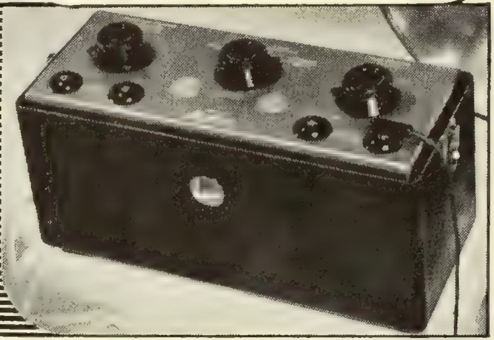
Portable Electrosurgical Unit

. . . a MODERN LOW-COST SURGICAL UNIT for all minor and various major surgery.

The Birtcher BLENDTOME is a surprisingly practical unit for office surgery. With this lightweight unit, you have *all* the electrosurgical procedures of major units—electro excision, desiccation, fulguration and coagulation. While not meant to be compared to a large hospital unit, the BLENDTOME has been successfully used in many TUR cases. Such facility indicates the brilliant performance of the BLENDTOME.

ALL 4 BASIC SURGICAL CURRENTS

1. *Tube Generated Cutting Current.*
2. *Spark-Gap Generated Coagulation Current.*
3. *A controlled mixed blend of both above currents on selection.*
4. *Mono-polar Oudin Desiccation-Fulguration Current.*



Never before has a surgical unit of such performance been offered at the low price of the Blendtome.

Write "Blendtome Folder" on your prescription blank or clip your letter head to this advertisement. Reprint of electrosurgical technic mailed free on request. Please indicate your specialty.

Minnesota Academy of Medicine

Meeting of December 14, 1949

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, December 14, 1949. Dinner was served at 7 o'clock, and the meeting was called to order at 8:10 by the President, Dr. J. A. Lepak.

There were fifty members and three guests present.

Minutes of the November meeting were read and approved.

Dr. Lepak gave a talk on various phases of the Constitution and By-Laws, also election of new members. It was voted to continue the extra assessment of $5 per member for 1950. Motions were carried that the Academy vote $100 to the Litzenberg Memorial Fund, and $100 contribution to the Bell Pathological Museum.

The following officers were elected for 1950:

President............William Hanson, Minneapolis
Vice President.......William Hengstler, Saint Paul
Secretary-Treasurer..Wallace P. Ritchie, Saint Paul

The scientific program followed.

Dr. Charles Rea presented his paper on "Banti's Disease Treated by Splenectomy and Later by Gastric Resection." (See page 347.)

Dr. Walter P. Gardner, of St. Paul, read his Inaugural Thesis on "Psychiatry in Geriatrics." (See page 353.)

The meeting was adjourned.

A. E. Cardle, M.D., *Secretary*

In Memoriam

JOHN DOUGLAS WATSON

Dr. John D. Watson, for many years a practicing physician at Holdingford, Minnesota, died on February 13, 1950.

Dr. Watson was born at Socorro, New Mexico, November 19, 1885. He obtained his education at London, Ontario, in the local high school and at the London Collegiate Institute. His medical degree was obtained at the University of Western Ontario at London, Ontario, in 1907. After taking postgraduate work at the Fort Douglas Army Hospital at Salt Lake City he practiced at Welton, Iowa, from 1907 to 1915.

Dr. Watson was a member of the Upper Mississippi Medical Society, the Minnesota State and American Medical Associations.

Dr. Watson is survived by his widow; a daughter, Mrs. Peter Holliday of Chicago; a son, Dr. William J. Watson of Saint Paul and a brother, Dr. A. M. Watson.

Woman's Auxiliary

NATIONAL OFFICER ADDRESSES STATE AUXILIARY

Mrs. Paul C. Craig, Reading, Pennsylvania, representing the national board of the Woman's Auxiliary to the American Medical Association, urged Minnesota doctors' wives to become familiar with the many health bills pending in Congress, so they could "give facts and thus help people form an opinion based upon facts."

Mrs. Craig spoke at the mid-winter board meeting and luncheon of the Woman's Auxiliary to the Minnesota State Medical association February 23, at the Minnesota Club in St. Paul. She paid tribute to the public service activities of the state medical association and its auxiliary for their use of Regional Health Days to develop community responsibility.

In discussing current legislation, Mrs. Craig emphasized that the medical profession must oppose those bills which it considers damaging to health progress, but, she added, the medical profession should support "much positive health legislation."

CHRONIC ILLNESS BEING STUDIED

She noted that the problem of the chronically ill is one of the unsolved medical problems of modern life. A commission for the study of this problem has been set up by the AMA, the American Public Welfare association, the American Public Health association and the American Hospital association. A grant of $25,000 from the AMA is supporting this project.

"It is not well known," Mrs. Craig stated, "that the chronically ill are not covered in the omnibus compulsory tax medical care program supported by the federal government."

VOLUNTARY PLAN INCREASE SCORED

Mrs. Craig, wife of a Reading, Pennsylvania, ophthalmologist, called attention to the rapid development of all types of voluntary health insurance plans throughout the country. She informed auxiliary members, that on the basis of growth, by the end of 1950, 77 million persons will be covered for hospital bills, 50 million will be insured against surgical costs and 21 million will be insured against medical costs, using the varied types of voluntary insurance now available in this country.

Discussing a recent fifteen month study of medical services done in New York state, Mrs. Craig pointed out that "the pressing need is not for additional facilities but for improving diagnostic services and in modernizing old buildings." The survey concluded that additional state aid is needed for mental and tuberculosis patients.

Mrs. Craig stated, "Already in New York 57 per cent of the population is covered by some type of voluntary

Doctor . . .

Here are two great Spot Tests that simplify urinalysis

GALATEST

The simplest, fastest urine sugar test known.

ACETONE TEST

(DENCO)

For the rapid detection of Acetone in urine or in blood plasma.

A LITTLE POWDER

A LITTLE URINE

COLOR REACTION IMMEDIATELY

Galatest and Acetone Test (Denco) . . . Spot Tests that require no special laboratory equipment, liquid reagents, or external sources of heat. One or two drops of the specimen to be tested are dropped upon a little of the powder and a color reaction occurs immediately if acetone or reducing sugar is present. False positive reactions do not occur. Because of the simple technique required, error resulting from faulty procedure is eliminated. Both tests are ideally suited for office use, laboratory, bedside, and "mass-testing." Millions of individual tests for urine sugar were carried out in Armed Forces induction and separation centers, and in Diabetes Detection Drives.

The speed, accuracy and economy of Galatest and Acetone Test (Denco) have been well established. Diabetics are easily taught the simple technique. Acetone Test (Denco) may also be used for the detection of blood plasma acetone.

Write for descriptive literature.

verage . . . growing rapidly through 1949. On the asis of this expansion in coverage, it is quite possible enroll up to 85 per cent of the population in Blue ross, Blue Shield and commercial plans."

Auxiliary members were asked to become familiar ith the findings of the Hoover Commission report, and use this book for book reviews.

Mrs. Craig was introduced by Dr. F. J. Elias, Duluth, resident of the Minnesota State Medical association. r. Elias praised the auxiliary, saying that it was and is a major part in our campaign." Citing the difficulty in valuating the accomplishments of any organization in a rogram of this type, he gave credit to the auxiliary for s help in three categories: (1) the distribution of amphlets, (2) opinion guidance which showed up favorbly in the Minnesota Poll, and (3) the increase in the umber of people covered by Blue Shield, Blue Cross nd other voluntary plans.

Nearly 100 women attended the board meeting and ncheon which was open to all state auxiliary members. Irs. H. E. Bakkila, Duluth, auxiliary president, preded during the meeting. Mrs. Charles W. Waas, 993 omo Blvd., St. Paul, president-elect, was in charge of cal arrangements.

HEALTH DAY PLANS ARRANGED

Mrs. S. N. Litman

Another in the series of Health Days, to be held April 14, is being arranged by the Woman's Auxiliary to the St. Louis County Medical Society in co-operation with the medical society, the Duluth Health Council and the Minnesota Department of Health and related organizations. Health Days, initiated by the Auxiliary to the Minnesota State Medical association, have gained national recognition and are being used by other states who realize their value in bringing health problems before interested people in their respective communities.

St. Louis, Cook, and Carlton counties will participate in the Health Day, which is planned for the purpose of bringing to the people an increased awareness of community health problems and ways of meeting them more effectively. Medical talks, discussions, exhibits and motion pictures will be on the day's program in the Spalding Hotel, Duluth.

Mrs. P. S. Rudie, general chairman, is being assisted by Mrs. Harold Wahlquist, health day chairman for the Minnesota State Medical auxiliary, Wallace Fulton of the Minnesota Department of Health, and Mrs. Ruth Hosted, secretary of the Duluth Health Council.

Statesmen and economists all over the world seem to realize the close relation between health and economy, health and social conditions, health and the standard of living.—*WHO Newsletter,* July-August, 1949.

◆ Of General Interest ◆

All Minnesota physicians are invited to submit to Minnesota Medicine items "of general interest" concerning themselves or their colleagues. To ensure accuracy and completeness, it is suggested that items submitted contain the answers to the age-old newspaper questions: who, what, where, when and (in some cases) why. Only the facts are necessary, since items can be rewritten for consistency of style.

* * *

Dr. John T. Smiley has been appointed by the Minnesota Department of Health to the position of director of Health District No. 6, comprising Anoka, Chisago, Dakota, rural Hennepin, Isanti, Kanabec, rural Ramsey, Washington and Wright Counties. Dr. Smiley was formerly assistant superintendent of Ancker Hospital, Saint Paul, superintendent of the county hospital at Stockton, California, chief of the Bureau of Hospital Licensing and Inspection, California State Department of Health, and chief medical officer of the Ledo Road project in the Burma-India Theater during World War II.

* * *

Dr. and Mrs. J. W. Stuhr of Stillwater recently returned from a two-week visit in California.

* * *

The opening of offices at 1253 Medical Arts Building, Minneapolis, has been announced by **Dr. John K. Grotting,** who is limiting his practice to plastic and reconstructive surgery.

Dr. Grotting received training in general and plastic surgery at the Mayo Clinic, where he has been for the past four years. He holds a master of science degree in plastic surgery granted by the University of Minnesota.

At a meeting of the Polk County (Wisconsin) Medical Society at Balsam Lake, Wisconsin, on March 16, **Dr. William B. Stromme** of Minneapolis presented a paper on "Dystocia."

* * *

Dr. Don V. Smith joined the staff of the Blue Earth Medical Center on March 1. A graduate of Northwestern University Medical School in 1943, Dr. Smith served his internship at Cook County Hospital, Chicago, and then served in the Army for two years, part of the time in Japan. He completed a one-year surgical residency at Eitel Hospital, Minneapolis, and then became associated in practice with Dr. George Eitel in Minneapolis. In his new situation in Blue Earth he is associated with Dr. George W. Drexler and Dr. Ralph E. Wenzel.

* * *

Dr. Henry E. Michelson, professor of dermatology at the University of Minnesota Medical School, delivered the Alembert Winthrop Brayton birthday dinner address at Indianapolis on March 9. His subject was "Cutaneous Tuberculosis and Sarcoidosis."

Dr. A. M. Watson of Royalton was one of the chief defense witnesses when the people of Morrison County recently went "on trial" for not doing all they could to improve public health in their own communities. There were twenty-one witnesses in all at the mock trial held in the County Court House at Little Falls. Those for the defense described the many types of health services available to residents of the county, but those for the prosecution made it clear that the people were not using these services fully or effectively, nor doing all they could to sustain, extend and improve them.

The trial was planned by the county nursing service, with help from the district and state offices of the Minnesota Department of Health, and was used to promote an immunization campaign about to start in the county.

* * *

"Effect of Beta Irradiation on Gastric Acidity" was the title of a paper presented by Dr. R. F. Hedin, Dr. W. R. Miller and D. G. Jelatis, Sc.D., at a meeting of the Central Surgical Association in Chicago on February 16 to 18. Dr. Hedin and Dr. Miller are associated with the Interstate Clinic in Red Wing.

* * *

Members of the Sedgwick County Medical Society, meeting at Wichita, Kansas, on March 2, heard **Dr. Albert V. Stoesser,** Minneapolis, speak on "Uses and Abuses of the Antihistamines."

* * *

The directors of the Passano Foundation have announced that its award for 1950 will be a dual one, the $5,000 cash award going to **Dr. Edward C. Kendall** and **Dr. Philip S. Hench,** both of the Mayo Clinic, for their studies in clinical physiology as related to the administration of cortisone and related hormones. The award will be presented at the annual award dinner, held this year at the St. Francis Hotel in San Francisco on June 28, during the week of the A.M.A. annual meeting. The Passano Foundation was established in 1943 by the Williams and Wilkins Company, medical publishers, to aid in the advancement of medical research.

* * *

It was announced on March 3 that **Dr. Gordon W. Franklin** planned to visit Northome to look over facilities for both office and living quarters. He planned, it was said, to begin practice in Northome in July, following completion of his internship. Northome has been without the full-time services of a physician for two years.

* * *

Dr. Nels Strandjord of the Lenont-Peterson Clinic, Virginia, gave a talk on congenital heart disease at a meeting of the Virginia Lions Club on March 1.

YOUR *TOP LAYER* INCOME

TAXABLE INVESTMENT INCOME is your most expensive income since, under our progressive income tax system, it is this *"Top Layer"* income that pays the heaviest taxes.

There is little a taxpayer can do about his taxable income received from:

Professional Income
Salaries
Business Profits
Dividends from Business

These are main sources of revenues—your basic income. *"Top Layer"* income, however, your investment income, is something that you definitely have control over in that it is within your power to give such income either a "taxable" or a "tax-free" status.

The income from investments which is subject to taxation actually shrinks in yield whenever your professional income increases and forces this taxable *"Top Layer"* income into a higher bracket. In other words, the more your active earning power is increased, the greater percentage of your taxable investment income will be paid out in taxes

Tax-free income is interest income on Municipal Bonds. This interest is exempt from all present Federal Income Taxes and consequently provides a *"Top Layer"* income that remains constant regardless of changes in other income or tax rates.

The two following examples clearly demonstrate the effect of Federal Income taxes on *"Top Layer"* income:

If you are in the $12,000-$14,000 income tax bracket and purchase an investment to yield 2.50% you will realize only 1.55% if the income is taxable but will receive the full 2.50% if it is not taxable.

If you are in the $20,000-$22,000 income tax bracket and purchase an investment to yield 3.00% you will realize only 1.54% if the income is taxable but will receive the full 3.00% if it is not taxable.

We have a handy chart which will show such comparisons for the various taxable income brackets and will be pleased to send you one on your request.

Dr. Gordon Kamman, Saint Paul, was the principal speaker at a meeting of the Stearns-Benton County Medical Society in St. Cloud on March 14. The title of his address was "The Present Status of Shock Therapies and Psychosurgery." Earlier in the month, Dr. Kamman gave the eighth and final lecture of the eight-week seminar on heart disease, cancer and psychosomatic medicine held in Duluth.

* * *

The recently constructed **Litchfield Clinic** building was opened to the public during the first week of March. The one-story modern-designed building houses the offices of Dr. Harold E. Wilmot, Dr. Cecil A. Wilmot, Dr. Donald E. Dille and Dr. W. A. Chadbourn. In addition to providing three rooms for each physician, the structure contains a minor surgery room, x-ray room, laboratory, library and drug room.

* * *

Dr. Alson E. Braley, a former resident of Lake Mills, has been appointed professor and head of the department of ophthalmology in the University of Iowa College of Medicine.

* * *

Dr. A. B. Baker was a speaker at the general meeting of the Saint Paul Branch of the American Association of University Women in Saint Paul on March 7. Dr. Baker, professor and director of the division of neurology at the University of Minnesota, spoke on "Study, Treatment and Diseases of the Nervous System." He also showed the motion picture, "The Journey Back."

* * *

Among Minnesota physicians attending the second annual scientific assembly of the American Academy of General Practice, held in St. Louis, February 20 to 23, were Dr. O. B. Fesenmaier, New Ulm; Dr. Roger G. Hassett, Mankato, and Dr. J. Earl Schroeppel, Winthrop.

* * *

Dr. Donald E. Stewart, of the Northwestern Clinic, Crookston, attended a three-day cancer-detection clinic at the University of Minnesota during the middle of February.

* * *

Cancer research funds totaling $61,071 have been granted to the University of Minnesota for the year beginning July 1, it was announced early in March.

* * *

The dangers of socialized medicine were described by **Dr. Willard Akins** of Red Wing in a talk given at a meeting of the Men's Club of the First Lutheran Church in Red Wing on February 27.

* * *

Dr. Ruth E. Boynton has been named president of the State Board of Health, succeeding Dr. T. B. Magath, who recently resigned. Dr. Boynton has served as director of the Students' Health Service at the University of Minnesota since 1936 and has been professor of preventive medicine and public health since 1938. She has been a member of the State Board of Health since 1939 and served as president of it in 1945.

* * *

Dr. Francis J. Crombie has opened new offices at 1234 Division Street, South St. Paul. The interior of the building at that address has been completely remodeled and partitioned into ten rooms. All rooms have been sound-proofed and redecorated. The offices include examination rooms, x-ray room, minor surgery room, nurse's office, and a large reception room.

* * *

Dr. S. A. Slater, Worthington, attended a two-day meeting of the board of the National Tuberculosis Association in Chicago on February 3 and 4.

* * *

On February 19 the engagement of Miss Angela Marie Jelinek to **Dr. Louis B. Kucera** was announced. Miss Jelinek is a resident of Saint Paul, and Dr. Kucera is a former resident of Owatonna. The wedding will be held in the fall.

* * *

Dr. Malcolm Hargraves, Rochester, was the principal speaker at a meeting of the Martin County Conservation Club in Fairmont on February 14. Dr. Hargraves, well known for his conservation work, is a past president of the Minnesota chapter of the Izaak Walton League.

* * *

In a talk before the **Hennepin County Medical Society** on March 6, a Scottish surgeon, T. H. Craw-

ford Barclay, said that the patient, the general practitioner and the specialist are all unhappy under socialized medicine in Britain. Mr. Barclay—to use the British method of referring to surgeons—said that the patient feels he is not given enough time, the general practitioner is overworked and underpaid, and the specialist is "under the thumb" of the government, with the government refusing to promote younger specialists to adequately paying positions. Mr. Barclay described one London physician who was forced to see 150 patients in five hours; and he stated that tuberculosis is one of Britain's major problems, since not enough facilities are available for housing the numerous infected persons.

Mr. Barclay holds a one-year United States Public Health Service fellowship, and he is now studying at the University of Minnesota.

* * *

At the first 1950 quarterly meeting of the Minnesota Occupational Therapy Association, held in Minneapolis on March 4, **Dr. Frederic J. Kottke,** of the University of Minnesota department of physical medicine, was the principal speaker.

* * *

Dr. Warren W. Haesly, Wykoff, attended the 100th anniversary convention of the Chicago Medical Society held during the first week of March. While in Chicago, Dr. Haesly also attended the alumni conference of St. Luke's Hospital, Chicago. Both gatherings featured color television demonstrations of surgical operations.

* * *

Dr. and Mrs. Edward A. Colp, Robbinsdale, spent the month of February on a trip through the Rio Grande Valley and Mexico. On his return, Dr. Colp opened new medical offices at 3859 W. Broadway.

* * *

At the meeting of the Scott County board of county commissioners on February 14, **Dr. H. M. Juergens,** Belle Plaine, was named coroner of Scott County. He succeeds Dr. H. W. Havel, who resigned recently.

* * *

Forty-five members of the **American Association of Obstetricians, Gynecologists and Abdominal Surgeons** held a two-day mid-winter clinic in Rochester on February 24 and 25. Among speakers at the clinic were Dr. Robert B. Wilson, Dr. James S. Hunter, Dr. Arthur B. Hunt and Dr. John E. Faber, members of the Mayo Clinic section on obstetrics and gynecology.

* * *

Dr. Francis J. Schnugg, Brainerd, was narrator for a motion picture on the heart fund campaign shown at a meeting of the Lions, Rotary and Exchange Clubs in Brainerd on February 15.

* * *

It was announced on February 16 that **Dr. Virginia Gross** had arrived at the Fergus Falls State Hospital to become a member of the staff. Formerly

An Observation on the Accuracy of Digitalis Doses

Withering made this penetrating observation in his classic monograph on digitalis: "The more I saw of the great powers of this plant, the more it seemed necessary to bring the doses of it to the greatest possible accuracy."[1]

To achieve the greatest accuracy in dosage and at the same time to preserve the full activity of the leaf, the total cardioactive principles must be isolated from the plant in pure crystalline form so that doses can be based on the actual weight of the active constituents. This is, in fact, the method by which Digilanid® is made.

Digilanid contains all the *initial* glycosides from Digitalis lanata in crystalline form. It thus truly represents "the great powers of the plant" and brings "the doses of it to the greatest possible accuracy".

Clinical investigation has proved that Digilanid is "an effective cardioactive preparation, which has the advantages of purity, stability and accuracy as to dosage and therapeutic effect."[2]

Average dose for initiating treatment: 2 to 4 tablets of Digilanid daily until the desired therapeutic level is reached.
Average maintenance dose: 1 tablet daily.
Also available: Drops, Ampuls and Suppositories.

lic health center in the Midwest, the $270,000 building houses the Rochester-Olmsted County Health Department and the District 3 office of the State Department of Health. The building, which is dedicated to the memory of Dr. Charles H. Mayo, was financed primarily by a gift from the Mayo Association, an appropriation by the city of Rochester, and a Federal grant. Modern in design, it provides facilities for all the health and welfare activities of the area.

* * *

Dr. Edward S. Rall, a fellow in the Mayo Foundation, was named winner of the American Goiter Association VanMeter essay award on March 9. His essay, which was presented at the Association's annual meeting in Houston, Texas, dealt with the identification of iodine compounds in blood and urine.

HOSPITAL NEWS

Falls Memorial Hospital, International Falls.—At the annual meeting of the medical staff of the Falls Memorial Hospital, Dr. C. C. Craig was elected chief-of-staff, and Dr. Edward B. Kinports was named secretary-treasurer.

* * *

St. Mary's Hospital, Minneapolis, has completed construction work on a new postanesthesia room—a recovery room for patients after operation. Patients are taken to the room following operation and are kept there under the care of a special staff until they have completely recovered from the anesthesia. Equipment is available for immediate action in case emergency treatment becomes necessary. The room was set up under the direction of Dr. Stanley Wesolowski, director of anesthesiology at the hospital.

* * *

It was reported on February 23 that construction work on the new **Renville County Hospital** at Olivia was progressing rapidly. Plans called for construction of partitions and plastering early in the spring. When it was learned that the project would require an extra $60,000, a campaign was started in the surrounding villages and towns. By late February cash and pledges had almost totaled that amount.

* * *

The new neurologic center at **Glenwood Hills Hospitals** was officially opened on February 12. The opening day ceremonies were highlighted by talks by Governor Luther Youngdahl, Raymond T. Rascop, hospital superintendent, Dr. Julius Johnson, chief-of-staff, and Raymond Ewald, member of the board of trustees.

* * *

Ways and means for launching a successful campaign for funds for the **Aitkin Community Hospital** were discussed at a special meeting called by the hospital board on March 6. Civic organizations throughout the area sent representatives to give advice on setting up the project.

BLUE CROSS-BLUE SHIELD NEWS

Blue Shield claims in January totalled 2,575, representng 3,145 medical-surgical services. Blue Shield services endered at homes accounted for eight claims, services n doctors' offices for 520 claims, and services in hospitals for 2,047 claims.

Surgical procedures accounted for 1,543 Blue Shield services in January, medical for 999 services, and X-ray, anesthesia, and other related services for 603 Blue Shield services rendered in January.

Single subscribers with incomes of less than $2,000 annually, and family subscribers with incomes of less than $3,000 annually, who receive unlimited subscriber benefits, incurred 885 claims representing 34.4 per cent of the total claims paid in January. Although this is not the greatest number of claims paid in any one month for unlimited subscribers, it represents the highest percentage of total claims paid in any one month incurred by unlimited subscribers since February, 1948.

Altogether, Minnesotans received $97,269.47 in Blue Shield medical-surgical benefits during January. Of this amount 94.2 per cent or $91,628.34 was in payment of claims submitted by participating doctors for services to Blue Shield subscribers, and 5.8 per cent or $5,641.13 for claims submitted by non-participating doctors.

During the month of February, Minnesota Medical Service Inc., with the approval of the State Insurance epartment, paid the balance of notes held by doctors. Of the total $86,000 subscribed and loaned by doctors of Minnesota to assist the Blue Shield plan for working capital, only about $20,000 was actually used. The repayment of the total amount of notes to doctors was therefore not a great hardship upon the Association. However, the wonderful response of Minnesota doctors who were willing to underwrite the Plan was most encouraging. We thank you all again.

During January 9,192 Blue Shield applications were made effective, making the total Minnesota Blue Shield enrollment 282,887. Nearly 4,000,000 persons were added to the seventy-six Blue Shield plans in 1949, making a total Blue Shield enrollment of more than 14,250,000 as of December 31, 1949.

The demand for Blue Cross-Blue Shield coverage was clearly demonstrated in the first non-group Blue Cross-Blue Shield enrollment campaign ever to be conducted in Minnesota. The campaign, which began January 1 and closed January 21, brought 22,883 inquiries and 10,362 applications were returned. Over 1,000 persons inquired at the information desk about the new, non-group coverage; 6,164 persons inquired by telephone, and 15,654 persons inquired by mail. On February 10, the final date for acceptance of non-group contracts, over 45 per cent of the people who had inquired about the non-group coverage had sent in their applications. An additional 652 inquiries came from thirteen other states and Canada. These inquiries were referred to their respective Blue Shield and Blue Cross plans in their area.

Minnesota Blue Cross enrollment on January 31, 1950, totalled 989,474. Payments to hospitals during January amounted to $741,092.03—an increase of $82,390.51 over the amount paid during January, 1949.

Across the nation, about 900,000 steel workers and their families will be covered by Blue Cross as a part of the agreements which settled last fall's nationwide steel strike. Approximately 15,000 steelworkers in Minnesota will come under the hospitalization program provided by Blue Cross. A commercial contract was selected by the steel workers covering surgical services. It is hoped that a national contract can eventually be worked out to cover the steelworkers for Blue Shield benefits.

To supply the hospitalization program for steelworkers and their families, Blue Cross plans wrote a contract which, for the first time, offers similar rates and benefits for every employe regardless of where he lives. Ordinarily, employes of nationwide industries are enrolled in their local plans, pay local plan rates and receive local plan benefits. The steel contracts provide a uniformity of benefits and rates which will serve as a model for formulating future Blue Cross agreements in other nationwide industries where uniform coverage of employes may be desired.

Over 36,000,000 persons in the United States and Canada are Blue Cross subscribers.

The annual joint conference of Blue Cross and Blue Shield plans was held in Montreal, Quebec, from February 26 to March 1. Arthur M. Calvin, executive director of the Minnesota plans, was elected a commissioner of the Blue Shield medical care plans representing Minnesota, Wisconsin, Iowa, Nebraska, North Dakota and South Dakota. Dr. A. J. Offerman, president of the Nebraska Blue Shield plan, was also elected a commissioner from this district. Each district is entitled to one commissioner who is a doctor of medicine and one commissioner who is an executive director of a Blue Shield plan.

The conference meetings primarily concerned Blue Cross-Blue Shield policies. Some of the main actions taken involved the Inter-Plan Transfer Agreement. Among other changes, the most important effected the cancelling of contracts held by subscribers who move out of one plan's area into an area served by another participating plan.

Both Blue Cross and Blue Shield Commissions revised their standards for approval of Plans, establishing more definite requirements for Plans to meet financial responsibility as well as non-profit sponsorship and control.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

HANDBOOK OF OBSTETRICS AND DIAGNOSTIC GYNECOLOGY. Leo Doyle, M.S., M.D. 240 pages. Illus. Price $2.00, flexible binding. Palo Alto, California: University Medical Publishers, 1950.

A CENTURY OF MEDICINE IN JACKSONVILLE AND DUVAL COUNTY. Webster Merritt. 201 pages. Illus. Price $3.50, cloth. Gainesville, Florida: University of Florida Press, 1949.

UROLOGICAL SURGERY. Second Edition. Austin Ingram Dodson, M.D., F.A.C.S., Professor of Urology, Medical College of Virginia; Urologist to the Hospital Division, Medical College of Virginia; Urologist to Crippled Children's Hospital; Urologist to St. Elizabeth's Hospital; Urologist to St. Luke's Hospital and McQuire Clinic. 855 pages. Illus. Price $13.50, cloth. St. Louis: C. V. Mosby Co., 1950.

MEDICINE OF THE YEAR. John B. Youmans, M.D., editor, Dean, School of Medicine, Vanderbilt University. 204 pages. Price $5.00, cloth binding. Philadelphia: J. B. Lippincott Company, 1950.

THE PHYSIOLOGY OF THOUGHT; A FUNCTIONAL STUDY OF THE HUMAN MIND IN ACTION. By Harold Bailey, M.D., F.A.C.S. 314 pages. Price $3.75. New York: The William-Frederick Press, 1949.

This 314-page book is written by Dr. Harold Bail-ey, ophthalmologist, living in Charles City, Iowa, a raduate of Rush Medical College in 1897.

The preface states, "We shall limit the text to a onsideration of our own ideas, and we shall devote ittle space to the discussion of views expressed by ther writers."

The contents of the book bears out this plan of he author. His ideas, theories, and philosophies, as et forth, show that the author did considerable rowsing among philosophic and psychologic books, f which he most frequently mentions William James' Principles of Psychology."

The language used in the book is semi-popular, but nough technical terms are sprinkled throughout to ake it difficult reading for a layman.

The book can hardly be recommended as being f any interest, much less of any scientific value, to a odern physician, psychiatrist, or psychologist.

EARING TESTS AND HEARING INSTRUMENTS. By Leland A. Watson and Thomas Tolan, M.D. 597 pages. Illus. Price $7.00. Baltimore: The Williams & Wilkins Company, 1949.

The authors state that the purpose of the book is to rovide a comprehensive and primarily practical text on earing instruments and their application, intended for hysicians, nurses, rehabilitation officers, school health fficers, hearing aid technicians and those who dispense nd fit hearing aids, and presented in a generalized style hich avoids a strictly medical or a strictly engineering pproach.

The material is presented in six parts, seventeen chapers and 520 pages.

Part I. Background of the audiometer and funda-

mentals of hearing as related to audiometers and hearing aids, of audiometry and of basic audiometric technique.

Part II. Interpretation of audiometric data.

Part III. Technical and engineering aspects of the audiometer.

Part IV. Social aspects of audiometry, including military, industrial, medico-legal and school phases.

Part V. Hearing Aids.

Part VI. Advanced audiometry, including speech hearing tests.

This division of material facilitates ready reference. The book reflects an exhaustive study of the literature on hearing aids and audiometers published since 1939 and a comprehensive knowledge of these subjects. Much material is presented on a wide variety of topics of especial interest to the otologist, such as that on sound proof and acoustically treated rooms for audiometry, the relation between pure tone audiograms and speech hearing tests, the role of the audiometer in military, industrial and medico-legal fields and the economic aspects of the hearing aid industry, such as the extent of the active and potential market, annual sales, cost of hearing aid up-keep and role of the retail dealer.

The bibliography, by author, publication and subject, is exhaustive and usable. There is also a glossary of terms used in audiology, sponsored by the Acoustical Society of America and by the Institute of Radio Engineers, Inc., which is most helpful and covers many subjects, especially engineering, with which the otologist has little or no acquaintance.

The book is profusely supplied with tables and illustrations, including many audiograms, and a general glossary and index. The material is well organized and presented and constitutes a valuable source for reference.

It is the reviewer's opinion that the authors have well accomplished their intended purpose; the book is unreservedly recommended.

CHARLES E. CONNOR, M.D.

BARBITURATE POISONING

(Continued from Page 370)

with the use of inadequate initial doses and neglect to repeat as often as needed."

The dosage of metrazol must be governed solely by the degree of the depression present.

In a review of the literature dealing with the use of massive doses of metrazol for the treatment of barbiturate poisoning, no case was found in which such a large amount of the drug had been administered, although Engstrand and Hruza[2] reported a case in which 80 c.c. of metrazol had been given in divided doses with complete recovery of the patient.

Give to Conquer Cancer
Strike Back!

THE fight is on to save more lives in 1950! Now is the time to back science to the hilt in its all out battle against cancer.

Last year, 67,000 men, women and children were rescued from cancer. Many more can be saved — if *you* resolve to save them—if *you* strike back at cancer. Give! Give your dimes, quarters, dollars. We need more treatment facilities, more skilled physicians, medical equipment and laboratories. The success of great research and educational programs depends on your support. Your contribution to the American Cancer Society helps guard your neighbor, yourself, your loved ones. This year, strike back at cancer... Give more than before... Give as generously as you can.

AMERICAN CANCER SOCIETY

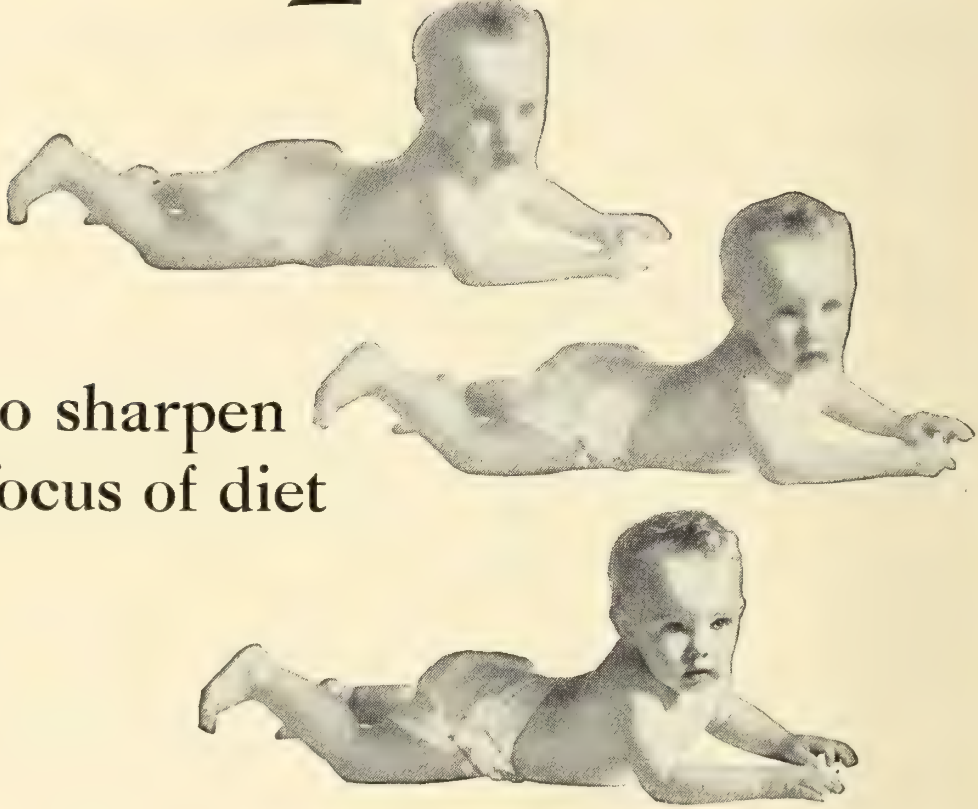
Flexible Formula

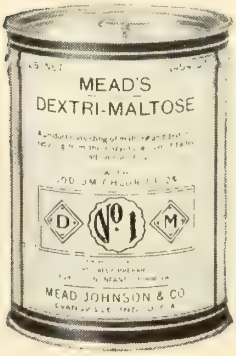


...to sharpen the focus of diet

When an infant's diet is not formulated to his exact needs, it is like a picture out of focus. For an individualist, the basic formula must be *flexible* to meet the changing needs of the moment—to bring the diet "into focus."

Dextri-Maltose* has been preferred by two generations of physicians because of its exceptional flexibility in formulas using whole or evaporated milk. Quantities of this carbohydrate can be varied at will with the varying caloric requirements of the individual infant; and Dextri-Maltose is available in *five* forms to meet certain clinical conditions without disturbing the feeding routine.

Not too sweet, readily soluble and easy to use, Dextri-Maltose is highly digestible and slowly absorbed. No other carbohydrate for infant feeding enjoys so authoritative a background of clinical experience.



MEAD'S

Won't You Pay Us a Visit

13 years ago, the Caswell Ross Agency enrolled its first group in Minnesota under the Professional Special Disability Plan, this group being the Hennepin County Medical Society. Today we have a total of 19 professional associations in Minnesota enrolled under this plan of accident and sickness insurance.

Included in this list of associations is the Minnesota State Medical Association, thereby giving those members whose county societies have not adopted the plan an opportunity to obtain this splendid policy. If we have not been able to visit with you personally, we shall be very grateful if you will accept our invitation to stop at our booth during the June Convention in Duluth and ask us about the Special Disability Policy.

AUREOMYCIN HYDROCHLORIDE LEDERLE

in Rickettsial Infections

The discovery of aureomycin marked an epoch in antibiotic specific therapy. The rickettsiae, lying midway between the bacterial and the viral infections are immediately inhibited or killed by this antibiotic. Rocky Mountain spotted fever, Q fever and typhus fever all respond dramatically to aureomycin, without reference to the stage of the disease at which therapy is begun. The ability of this agent to penetrate the cell membranes and attack the intracellular rickettsiae is an important factor in producing its highly specific effect.

AUREO-
MYCIN

Aureomycin has also been found effective for the control of the following infections: African tick-bite fever, acute amebiasis, bacterial and virus-like infections of the eye, bacteroides septicemia, boutonneuse fever, acute brucellosis, Gram-positive infections (including those caused by streptococci, staphylococci, and pneumococci), Gram-negative infections (including those caused by the coli-aerogenes group), granuloma inguinale, *H. influenzae* infections, lymphogranuloma venereum, peritonitis, primary atypical pneumonia, psittacosis (parrot fever), Q fever, rickettsialpox, Rocky Mountain spotted fever, subacute bacterial endocarditis resistant to penicillin, tularemia and typhus.

Capsules: Bottles of 25, 50 mg. each capsule.
Bottles of 16, 250 mg. each capsule.
Ophthalmic: Vials of 25 mg. with dropper;
solution prepared by
adding 5 cc. of distilled water.

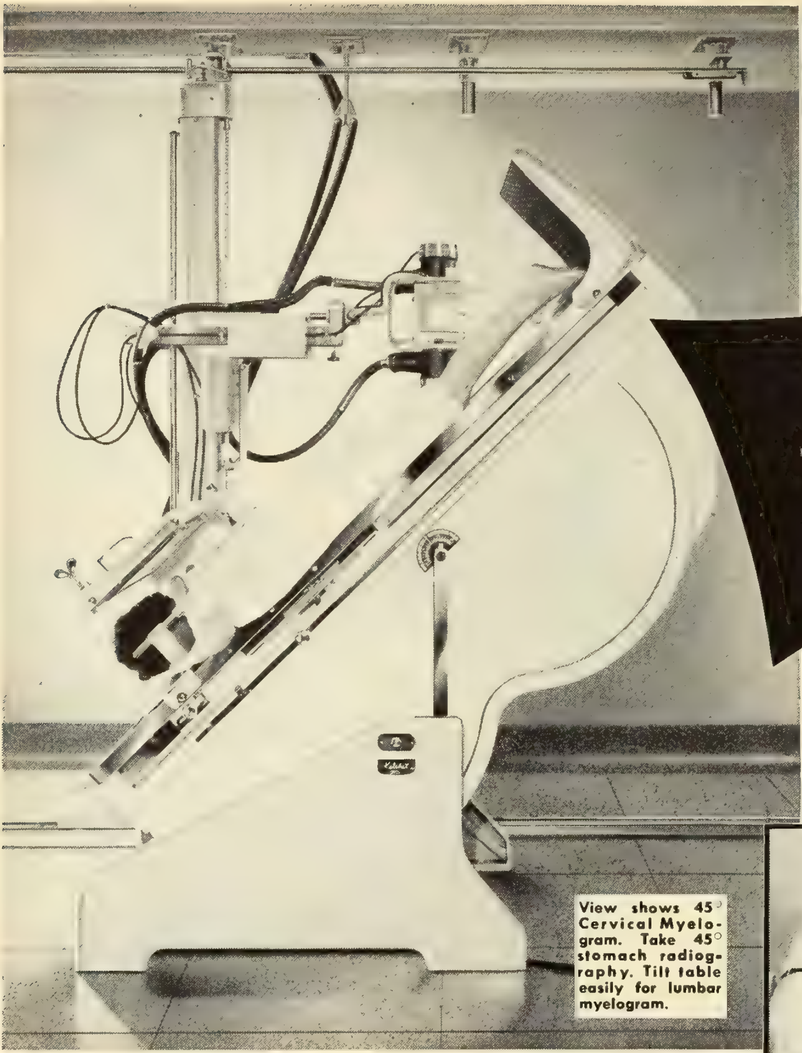
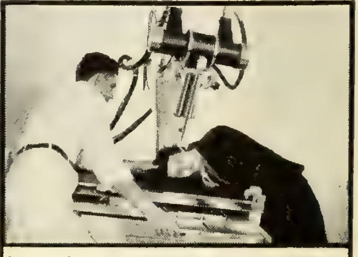
Two

The new "C" SUPERTILT TABLE

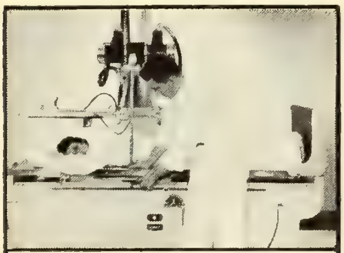
the only table offering 45° true trendelenburg



View shows 45° Cervical Myelogram. Take 45° stomach radiography. Tilt table easily for lumbar myelogram.



View shows mastoid special angulation. High speed bucky diaphragm travels to within 3" of foot end for skull work.



Two centering points always assure centering of bucky with fluoroscopic image, eliminating guesswork or extra effort.

Table is same height as standard stretcher to assure safe and easy transfer of patient.

The "C" Supertilt Table offers a range of angulation never before available. The table can be angulated 135° from 45° true Trendelenburg through horizontal to the vertical. Permits improved diagnostic technics, easier operation for fluoroscopy, radiography and fluorography.

All procedures involving encephalograms, ventriculograms, myelography and genito-urinary work are performed with ease and safety never before possible.

Actually, dozens of new features—results of years of research and field testing with eminent radiologists—makes the "C" Supertilt table years in advance of any table yet developed.

Illustrated here, are just a few of the many advantages the "C" Supertilt Table offers. Write for complete information.

IMPORTANT ADVANCES PIONEERED BY KELEKET!

The new 300 MULTICRON VERTICAL CONTROL

increasing capacity requires *only* timer exchange

Long noted for simplicity and highly automatic action, Keleket Multicron Controls are now even simpler and more automatic than before.

The new 300 MA Multicron Vertical Control automatically assumes greater responsibility. In addition, it provides increased facilities for consistently high quality diagnostic radiographs. This reduces possibilities for error and the cost of film "retakes."

The new Multicron safeguards you as your changing radiographic technics require greater power capacities. It is never necessary to trade in this new Multicron for a higher powered unit.

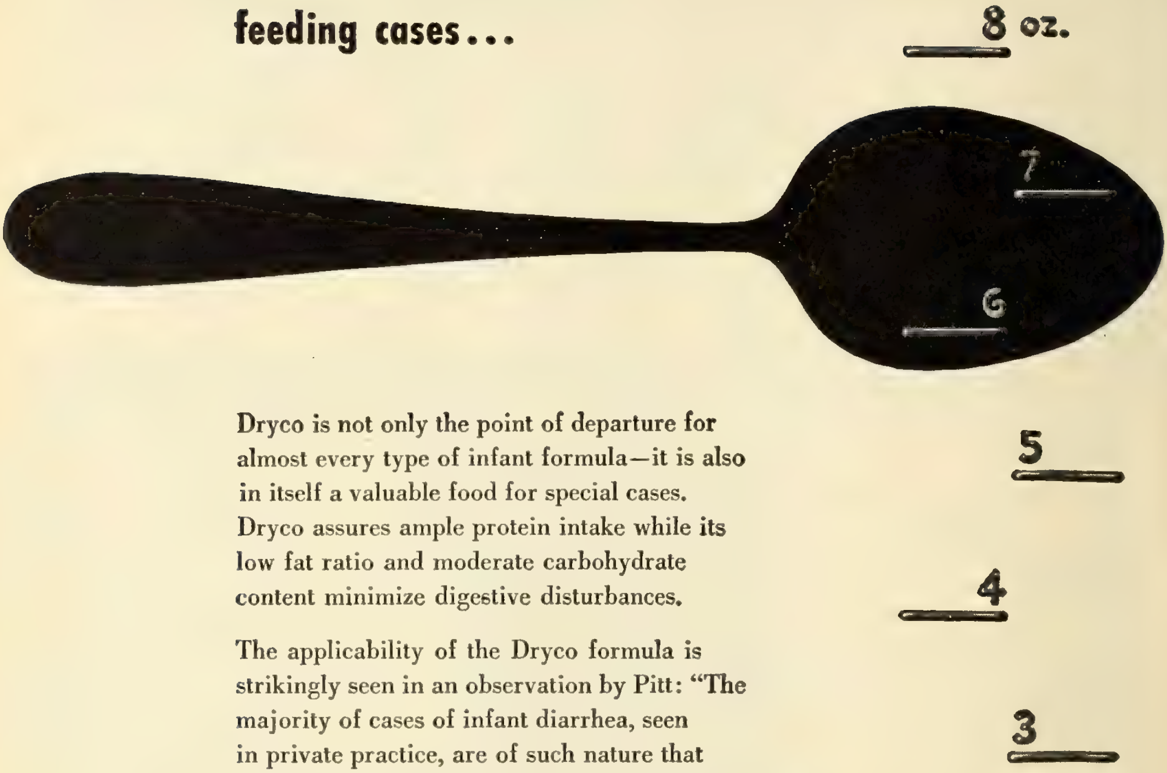
Simply exchange timers to meet increasing requirements. And you retain the same transformer and control because it is capable of producing 500 MA at 125 KV

OUTSTANDING AUTOMATIC FEATURES

- FIXED MILLIAMPERAGE
- AUTOMATIC SELECTION OF FOCAL SPOT
- FILAMENT COMPENSATION
- KV COMPENSATION
- ELECTRONIC TIMERS
- MAINLINE SWITCH COMBINED WITH PROTECTIVE OVERLOAD CIRCUIT BREAKER

...and of Keleket Quality!

point of departure for special feeding cases...



Dryco is not only the point of departure for almost every type of infant formula—it is also in itself a valuable food for special cases. Dryco assures ample protein intake while its low fat ratio and moderate carbohydrate content minimize digestive disturbances.

The applicability of the Dryco formula is strikingly seen in an observation by Pitt: "The majority of cases of infant diarrhea, seen in private practice, are of such nature that changing the formula to one of low fat and low carbohydrate is all that is necessary to correct the condition..." Dryco is specifically recommended for use in these cases.*

In addition to formula flexibility, Dryco offers other advantages.

Dryco's special drying process makes it more easily digested by certain infants than the fresh milk from which it is made. It supplies more minerals, particularly more calcium, than a corresponding formula of whole milk, plus 2500 U.S.P. units of vitamin A and 400 U.S.P. units of vitamin D per reconstituted quart. Only vitamin C need be added. Each tablespoonful supplies 31½ calories. Readily reconstituted in cold or warm water.

Available at pharmacies in 1 and 2½ lb. cans.

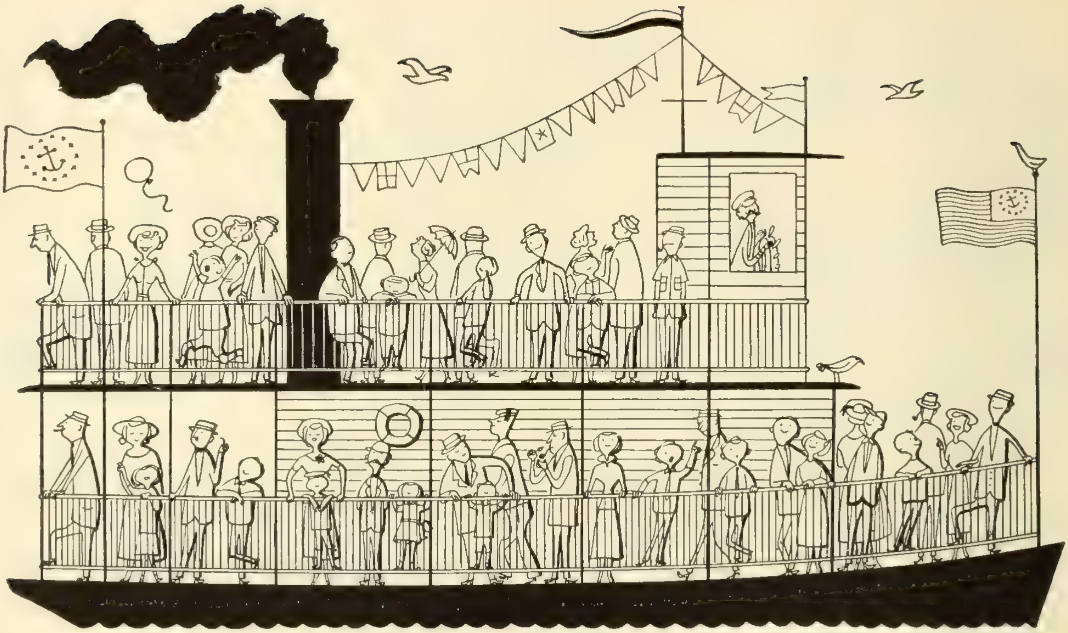
SCHERING



It would take a small excursion boat

to bring you all the patients who represent each of the many conditions for which short-acting NEMBUTAL is effective

● More than 44 clinical uses for short-acting NEMBUTAL have been reviewed in the literature during the 20 years the drug has been effectively used. Some of these uses may be applicable in your own practice.

With short-acting NEMBUTAL, doses adjusted to the need can provide any degree of cerebral depression—from mild sedation to deep hypnosis. Dosage required is only about *one-half* that of certain other barbiturates. Because there is less drug to be eliminated, there is less possibility of barbiturate hangover and wider margin of safety.

You'll find short-acting NEMBUTAL available in the form of Nembutal Sodium, Nembutal Calcium and Nembutal Elixir, all in convenient small-dosage preparations. Write for handy booklet, "44 Clinical Uses for Nembutal."

Terra firma

In conquering infection, medicine has built a firm and lasting foundation on products derived from the earth.

When it comes to control of infections, be they of bacterial, viral or rickettsial origin—our "terra firma" has provided a widening group of effective antibiotics.

In the screening, isolation, and production of these vital agents, a notable role has been played by the world's largest producer of antibiotics

Pfizer

CHAS. PFIZER & CO., INC., *Brooklyn 6, New York*

The Protein-Rich Breakfast and Morning Stamina

Extensive studies* by the Bureau of Human Nutrition have established that breakfasts rich in protein and supplying 500 to 700 calories, effectively promote a sense of well-being, ward off fatigue, and sustain blood sugar levels at normal values for the entire morning postbreakfast period.

These physiologic advantages are related mainly to the protein content rather than to the caloric content of the breakfast. In fact, when isocaloric breakfasts were compared, those with the higher amounts of protein led to the greatest beneficial effects. Breakfasts providing the lower quantities of protein (7 Gm., 9 Gm., 16 Gm., and 17 Gm. respectively) produced a rapid rise in the blood sugar level and a return to normal during the next three hours. Breakfasts providing more protein (22 Gm. and 25 Gm. respectively) produced a maximal blood sugar rise which was lower than that following the breakfasts of lower protein content, but the return to normal was delayed beyond the three hour period.

The subjects on the higher protein breakfasts "reported a prolonged sense of well-being and satisfaction." The findings indicated that the beneficial effects of the high protein breakfast on the blood sugar level may extend into the afternoon.

Meat, man's preferred protein food, is a particularly desirable means of increasing the protein contribution of breakfast. The many breakfast meats available are not only temptingly delicious and add measurably to the gustatory appeal and variety of the morning meal, but they also provide biologically complete protein, B-complex vitamins, and essential minerals. *Meat for breakfast, a time-honored American custom, is sound nutritional practice.*

Don't go hog wild—

on your ACCOUNTS RECEIVABLE

Usually the last one to be paid is the family doctor, and very often, no attention is given by him to the very important matter of commencing collection work *promptly after due date.* Too many doctors are going "hog wild" on this point and fail to realize its significance. Though startling as they may be, the figures shown in the following table are the factual result of authoritative studies, and they apply to the doctor as well as to the businessman.

COLLECTIBILITY OF ACCOUNTS—BASED ON AGE

Accounts	60 days	past due are	93% collectible.
Accounts	90 days	past due are	85% collectible.
Accounts	6 months	past due are	70% collectible.
Accounts	1 year	past due are	40% collectible.
Accounts	2 years	past due are	25% collectible.
Accounts	3 years	past due are	18% collectible.
Accounts	5 years	past due are	practically lost.

THE OUTLOOK ISN'T BRIGHT. More business and professional men look for lower profits than hope for higher earnings this year. That's because of lower prices and higher costs. Proper credit control is more important today than at any time since the war. Jobless at present are at a postwar high of 4½ million. Unemployment is likely to prove more of a headache than inflation.

NOW IS THE TIME to go after those "Receivables." You can't afford to let even one of them get away when it's so easy to get your money by using our tested and proven plan. This system has the "velvet touch" with the "dynamite punch." Your money is paid directly to you and you retain your debtor's good will. Get started now by using the coupon below or just sign and return for more information.

SYPHILITIC CARDIAC DEATHS IN OVER FIFTY THOUSAND AUTOPSIES

B. J. CLAWSON, M.D.
Professor Emeritus of Pathology, University of Minnesota
Minneapolis, Minnesota

THE deaths due to cardiac syphilis in the records in the Department of Pathology in the University of Minnesota during the years 1910-1947 are analyzed in respect to general incidence, incidence of types, age and sex, and gross and microscopic changes noted in the hearts. Death as a result of syphilitic aortitis, valvulitis or much less frequently from syphilitic myocarditis or gumma of the myocardium in the above autopsies is, according to Bell,[1] the most common cause of death in acquired syphilis. All of the cases with one exception, a gumma of the myocardium, were associated with syphilitic aortitis.

General Incidence

In a series of 4880 autopsies, Symmers[5] found syphilis of the aorta in 175 (3.6 per cent). At the Boston City Hospital, Reid[3] found seven cases of syphilitic aortitis in 100 successive autopsies. Gürich,[2] in 22,179 autopsies, noted evidences of syphilis in the heart in 806 (3.5 per cent). In our 50,730 autopsies, not including stillbirths, in the Department of Pathology at the University of Minnesota (1910-1947), there were 422 cases of syphilitic cardiac deaths (0.83 per cent). These 422 cases were 4.4 per cent of the total number (9585) of noncongenital cardiac deaths during the same period (Table I).

The percentage of cardiac deaths in the autopsy material is close to the percentage of such deaths in the general population in the State of Minnesota. The autopsies are fairly representative and nonselected. They have been performed in general and private hospitals, on private patients of physicians and in the coroner's service. The percentage of autopsies has been high, namely, about 25 per cent of the deaths in Minneapolis and 10 per cent of the State of Minnesota. This material because of its volume, wide distribution and large autopsy percentage appears to be valuable for making an approach to a statistical study of the incidence of diseases of the heart as a cause of death.

TABLE I. TYPES OF SYPHILITIC HEART DISEASE
422 cases in 9,585 cardiac cases (4.40 per cent) and in 50,730 autopsies (0.83 per cent), 1910-1947

Types	No.	Per cent of Group	Per cent Cardiac Cases	Per cent Autopsies

4. Gumma of myocardium	6	1.42	0.06	0.01
Total	422	99.99	4.40	0.83

Incidence of Types of Cardiac Syphilis

Depending upon the manner in which death occurred primarily, the 422 cases of cardiac syphilis were divided into four types (Table I): aortic insufficiency, 247 cases (58.5 per cent); narrowing of the coronary orifices, eighty cases (18.9 per cent); rupture of an aortic aneurysm, eighty-nine cases (21.1 per cent); and gumma of the myocardium, six cases (1.4 per cent). Commonly, there was an overlapping of the types, especially of the first three. A question might be raised as to whether the cases in which

death was due to a rupture of a syphilitic aneurysm should be included among the syphilitic cardiac deaths. These cases, however, commonly had some clinical evidences of cardiac failure and at autopsy exhibited an associated syphilitic valvulitis with cardiac hypertrophy and dilatation. They were, therefore, grouped as syphilitic cardiac diseases.

There has been a marked and significant drop in the incidence of cardiac syphilis in Minnesota in the last thirty-four years, as indicated by autopsy findings. This is illustrated in Table II in which seven five-year periods of autopsies are studied. These periods begin with 1914 and end with 1947. The last period has only four years. Only the ages of forty or over are included since syphilitic cardiac deaths so rarely occur in younger people. The seven periods, beginning with 1914, showed an incidence of 17.4, 20.4, 17.7, 13.8, 9.7, 7.7 and 2.3 cases of syphilitic heart deaths per thousand autopsies respectively. The cause of this highly significant reduction in cardiac syphilitic deaths can only be speculative. Education and therapy probably have been important factors.

Age and Sex Incidence (Table III)

The largest number of cases per thousand autopsies in decades among the males and females in the different types were as follows: aortic insufficiency, males, sixth decade (14.8), females, sixth decade (3.8); narrowing of coronary orifices, males fifth decade (5.7), females fifth decade (3.1); rupture of an aortic aneurysm, males fifth decade (5.5), females sixth decade (2.6); and gumma of the myocardium, males in the third decade and females in the fourth. Males predominated significantly in the first three types. There was a total significant preponderance of males (2.97 males to 1 female).

Pathology

Gross and microscopic changes, in varying degrees, are seen in the valves, myocardium and coronary orifices. The aortic was the only valve involved. The clinical signs referable to the heart with syphilitic aortic valvulitis were aortic regurgitation with cardiac hypertrophy and dilatation. Stenosis did not occur—a fact which is useful clinically in differentiating aortic valvular deformity due to rheumatic infection from the deformity due to syphilis. Two changes are noted in syphilitic aortitis and valvulitis: a cord-like free marginal thickening of the aortic cusps and separation of the valvular commissures or attachments of the cusps to the aorta. There is seldom a diffuse thickening of the cusps but they may have the appearance of being displaced. Microscopically in the marginal thickening of the valve there is an increase of connective tissue, and visible blood vessels are often greatly increased in size. A marked microscopic similarity exists between the structure of the free marginal thickening and the thickened valve resulting from rheumatic infection. The separation of the commissures of the cusps is due primarily to the intimal thickening of the aorta which separates the cusps and causes an aortic insufficiency. The above two changes account for nearly all of the aortic insufficiencies. However, in a few cases the insufficiency can only be explained by a stretching of the aortic ring. This probably occurs more frequently than can be observed at autopsy although it can sometimes be demonstrated by the pathologist.

TABLE IV. INCIDENCE OF KINDS OF VALVULAR INVOLVEMENT IN SYPHILITIC HEART DISEASE

Type	Marginal Thickening		Separation of Cusps		Both		One of Both	
1(223)	188	84.30%	175	78.47%	149	66.81%	204	91.03%
2 (70)	27	38.57%	39	55.71%	21	30.00%	45	64.28%
3 (60)	10	16.66%	13	21.66%	6	10.00%	17	28.33%

TABLE V. DEGREES OF CARDIAC HYPERTROPHY IN SYPHILITIC HEART DISEASE (400 CASES)

Weight of Hearts	Type 1		Type 2		Type 3		Total	
	No.	Per Cent	No.	Per Cent	No.	Per Cent	No.	Per Cent
Males below 350 or Females below 300	2	0.81	7	8.75	22	28.94	31	7.75
Males 350-399 or Females 300-349	3	1.22	21	26.25	21	27.63	45	11.25
Males 400-449 or Females 350-399	15	6.14	21	26.25	12	15.78	48	12.00
Males 450-499 or Females 400-449	18	7.33	18	22.50	10	13.15	46	11.50
Males 500 or more or Females 450 or more	206	84.42	13	16.25	11	14.47	230	57.50
Total	244	99.92	80	100.00	76	99.97	400	100.00

The frequency of the two anatomic valvular changes is noted in Table IV. The changes are most frequent in Type 1. Marginal thickening was observed in 84.3 per cent, separation of the commissures in 78.4 per cent, both conditions in 66.8 per cent and one or both in 91.0 per cent. There is an anatomic basis other than stretching of the ring for the myocardial failure in at least 91 per cent of the 188 cases of this type examined. In the seventy cases in Type 2 in which death was due to the narrowing of the coronary orifices and in the sixty cases in Type 3 with rupture of an aortic aneurysm, the valvular organic changes were less, one or both of the changes found in 64.2 per cent and 28.3 per cent respectively.

The chief gross change seen in the myocardium was the hypertrophy. The degree of cardiac hypertrophy of 400 hearts in the three types of cardiac syphilis is shown in Table V. With few exceptions male hearts weighing 400 grams or more and female hearts 350 grams or more may be considered as having a greater or less degree of hypertrophy. Two hundred and thirty-nine of the 244 hearts in Type 1 (97.9 per cent) were hypertrophied. Fifty-two of the eighty hearts in Type 2 (65 per cent) and thirty-three of the seventy-six cases (43.4 per cent) in Type 3 had varying degrees of hypertrophy. It is to be noted that the incidence of hypertrophy, in general, and the greatest degree of hypertrophy were much higher in Type 1 than in the other two types. Gross infarction was found in only an occasional case with a large heart and narrowing of the coronary orifices.

TABLE VI. DEGREES OF INVOLVEMENT OF CORONARY ORIFICES AND CORONARY ARTERIES IN SYPHILITIC HEART DISEASE

Degrees	Type 1				Type 2				Type 3			
	Orifices (223)		Arteries (153)		Orifices (74)		Arteries (70)		Orifices (58)		Arteries (78)	
	No.	Per cent	No.	Per cent	No.	Per cent	No.	Per cent	No.	Per cent	No.	Per cent
L++ R++ to L++++ R++++	59	26.45	10	6.53	68	91.89	1	1.42	11	18.96	11	14.10
Lo Ro to L++ R+ or L+ R++	164	73.54	143	93.46	6	8.10	69	98.57	47	81.03	67	85.89
Total	223	99.99	153	99.99	74	99.99	70	99.99	58	99.99	78	99.99

Except in the few cases with gumma of the myocardium, microscopic myocardial changes were seldom observed by an examination of several blocks from each of 106 hearts (Type 1, forty-six cases; Type 2, twenty-five cases and Type 3, thirty-five cases respectively). The changes which were observed were the type commonly associated with and resulting from atherosclerotic coronary arterial disease. Five blocks from each of the 106 hearts were stained by the Levaditi method. A careful search failed to reveal any spirochetes in any of the many sections examined. These findings agree with the observations of Saphir.[4]

The degrees of change noted in the coronary orifices and coronary arteries are seen in Table VI. These degrees are listed as +, ++, +++ and ++++. The changes observed in the orifices were narrowing due to the thickened intima of the aorta. The changes noted in the coronary arteries were not syphilitic in character but arteriosclerotic. L refers to the left orifice or artery and R to the right. Lo and Ro and L++ R+ or L+ R++ we considered to be close to the normal limit, especially to the arteriosclerotic findings in the coronary arteries for the ages of the groups reported. It is seen that the narrowing of the coronary orifices is greatest in Type 2 (91.8 per cent) in which death was not due primarily to congestive cardiac failure but to coronary insufficiency. Atherosclerosis of the coronary arteries in all of the types appears not to be greater than is found in nonsyphilitic cases.

Summary and Conclusions

The incidence of deaths from syphilitic aortitis with the associated narrowing of coronary orifices, syphilitic valvulitis, aortic insufficiency and congestive cardiac failure furnishes a fairly good estimation of the frequency of deaths from tertiary syphilis since cardiac syphilis has been found to be the most common manifestation of tertiary syphilis which results in death.

The general incidence of syphilitic cardiac deaths (0.83 per cent) in our autopsy material now ranks less than the deaths from the calcific aortic valvular deformity (1.35 per cent).

There has been a marked reduction in the frequency of syphilitic cardiac diseases during the past thirty-four years. The number of cases per thousand autopsies in people forty years or older has dropped from a high of 20.4 to 2.3.

Males predominated in the ratio of nearly 3 to 1. The greatest number per thousand autopsies of both sexes died in the fifth and sixth decades. No deaths occurred in the first and second decades.

The valvular lesions and lesions of coronary orifices far outnumbered in importance other involvements as myocarditis and gumma. In fact, a gumma of the myocardium is so rare that it may be considered doubtful if a clinical diagnosis of gumma of the myocardium should ever be made.

The most common manner of death with syphilitic heart disease is that which follows aortic insufficiency (58.5 per cent). Deaths due to narrowing of coronary orifices and rupture of a syphilitic aneurysm are about equal, 18.9 per cent and 21 per cent, respectively.

An anatomic basis (free marginal thickening or separation of the commissures of the cusps) for the aortic insufficiency appears to be present in more than 90 per cent of the cases in which insufficiency is present. Evidently a stretching of the aortic ring, alone, is responsible for the myocardial failure in but a few cases.

Except in a relatively few cases of gumma of the myocardium few changes other than hypertrophy are seen in the myocardium. The hearts

REVIEW OF 250 NECROPSY CASES OF HYPERTENSIVE CARDIOVASCULAR DISEASE

JAMES R. HOUSEHOLDER, M.D.
Duluth, Minnesota

THE general subject of hypertension is no small medical problem, and the effectiveness of its treatment is one of the more unsatisfactory chapters in the annals of medical therapeutics. The purpose of this paper is to briefly review some of the more important points in its basic pathological physiology, the most recent theories as to the etiology of so-called "essential" hypertension, trends in the newer methods of therapy, and an analysis of 250 necropsy cases at St. Luke's Hospital, Duluth, over a five-year period from July, 1943, to July, 1948.

TABLE I. SEX DISTRIBUTION

	No.	Per cent
Male	150	60.0
Female	100	40.0
Male predominated by a ratio of 3 to 2		

Hypertensive cardiovascular disease is more deadly than malignant neoplastic disease, the former taking upwards of 500,000 lives annually. The total deaths in the United States in 1943 were 1,459,544 with 645,109 or 44 per cent of these being due to cerebral hemorrhage, cerebral thrombosis, hemiplegia, chronic nephritis, and heart disease (exclusive of rheumatic heart disease). It has been estimated that at least 583,816 or 40 per cent of these patients had an associated hypertension. Some 90 to 95 per cent of hypertensives fall into the "essential" group so that about 554,625 (37.9 per cent) or slightly more than one-third of patients were dead from the effects of "essential" hypertension. Deaths from malignant neoplasm in 1943 were 169,000, so that hypertension accounted for almost three and one-half times the number of deaths due to malignancy in that year.[11] Hypertension accounts for about three-quarters of the deaths due to cardiovascular renal disease. About one-fourth of deaths over fifty years of age are due to hypertension in its various clinical manifestations. Statistically then we are dealing with a more deadly killer than most persons would suppose.

TABLE II. AGE DISTRIBUTION

Decade Group	M	F	No.	Per cent
0-10 yrs.	0	0	0	0
11-20 yrs.	0	0	0	0
21-30 yrs.	0	0	0	0
31-40 yrs.	4	0	4	1.6
41-50 yrs.	12	4	16	6.4
51-60 yrs.	27	26	53	21.2
61-70 yrs.	54	33	87	43.8
71-80 yrs.	35	24	59	23.6
81-90 yrs.	23	8	31	12.4
91-99 yrs.	0	0	0	0

From July, 1943, to July, 1948, there were 1,474 deaths at St. Luke's hospital, of which 374 were attributed to hypertensive cardiovascular disease. Excluding stillborn deaths, 24.7 per cent or slightly less than one quarter of deaths during this period were accounted for by this one disease complex alone. During this same period 309 (20.9 per cent) deaths were due to malignant neoplasms. It is apparent then that the percentage of hypertensive deaths follows, but not too closely, the trend as computed by the U. S. Bureau of Vital Statistics." The relation of cancer deaths as compared with the estimated overall national average likewise does not follow too closely, the ratio at St. Luke's being more nearly equal rather than hypertension being two to three times more predominant. The mortality rate four years after diagnosis of hypertension is 30 and 42 per cent in grades I and II, and 78 and 98 per cent in grades III and IV, the grading being on the basis of retinal and physical findings.[2] A particular cause for concern is the apparently earlier age at which "essential" hypertension is appearing and becoming fatal. Repeated clinical observations have shown that hypertensive members of a given family succumb earlier with each succeeding generation. It is not unusual to find the following typical family history: "Grandfather died at age seventy-two from a stroke; the mother died at age sixty from Bright's disease; and the son, aged thirty-five, is now suffering from a severe grade of hypertension."[4] In the St. Luke's series data on 172 of the cases showed that forty-nine (28.4 per cent) had a definite family history of the disease. This is in contrast to the figures of other authors in the literature that give 50 to 60 per cent positive family history in the majority of the case series, which implies a definite hereditary trend in the perpetuation of the disease. Any physician who takes refuge in the fact that an occasional patient survives hypertension for many years and feels that the disease is not serious is indulging himself in wishful thinking. That long-time survival is not common is borne out by the following rates of survival from the time of diagnosis to death. Data were available in ninety-six cases.

RATE OF SURVIVAL

	No.	Per cent	
1-5 years	41	42.7	79.1%
6-10 years	35	36.4	
11-15 years	16	16.7	
16-25 years	4	4.7	

Most patients died during the first five years after diagnosis, with a progressive drop in the death rate so that there was one patient surviving eighteen, twenty, twenty-four, and twenty-five years after diagnosis. At the other extreme of the scale we find that eight of the patients died within one year after diagnosis. During the first ten years after diagnosis 79.1 per cent of patients were dead.

TABLE III. PREVIOUS EPISODES

	No.	Per cent
None previous	129	55.3
Cardiac decomp.	52	22.3
Coronary accident	15	6.4
Cerebral accident	34	14.5
Uremia	3	1.2
Patients with multiple entities	13	5.1

The cardiovascular system is most frequently involved and usually sustains the greatest amount of damage, the greatest number of hypertensives making their exodus from failure of the cardiovascular system to maintain physiological states compatible with life. Elevation of the arterial pressure may be due to one or a combination of the following factors: (1) increased blood volume; (2) increased viscosity of the blood in the peripheral vessels, (3) increased cardiac output, (4) increased peripheral resistance due to a generalized arteriolar constriction. The first three have not been shown to play a significant role in "essential" hypertension, but the increased peripheral resistance has been implicated as the important factor producing the changes in the heart and peripheral vascular tree.[4] The basic and primary cause for the increased arteriolar tone is as yet unknown. Arterioles from hypertensives have shown more severe grades of medial hypertrophy with and without collagenous degeneration and intimal hyperplasia than normotensives of the same age groups. These lesions are found more frequently in sites such as kidneys, liver and the gastrointestinal tract which are rarely affected in normotensives.[12] These changes impose increased resistance in the peripheral system by virtue of decreased total cross section in the vascular bed. Whether these changes are due primarily to an aging process or a tissue response to long-continued effects of increased intravascular pressure is still unknown. Larger arteries, too, seem to be affected more frequently in hypertensives, some degree of arteriosclerosis being found in 115 (46.0 per cent) of this series. The changes in the hypertensive heart are reflections of the state of the arterial tree; the hypertrophy that eventually results is ascribed to sustained work against increased peripheral resistance and cardiac decompensation may eventually result. In the series of St. Luke's practically all of the cases were reported as having some degree of cardiac hypertrophy. This hypertrophy is relative, however, depending on the general build and estimated weight of the patient, a large heart in a small individual being of more significance than if found in a large obese or muscular individual. The majority of the heart weights fell between 400 and 600 grams, relatively few being on either side of this range. One weight was reported as 900 grams, the largest found in the series. There were all grades of dilatation and hypertrophy of the ventricular walls, the left being most consistently affected. The right ventricle showed far less incidence of hypertrophy, although dilatation was seen commonly secondary to decompensation. Experimental evidence has shown that in hypertension right intraventricular pressure is normal, indicative of normal arteriolar tone in the pulmonary bed. Right ventricular filling is not disturbed, and venous hemodynamics are not altered, venous pressure having been found to be normal

TABLE IV. SUBJECTIVE SYMPTOMS

Myocardial infarct	53	21.2	90
Cardiac decomp.	101	40.4	40.0

unless congestive failure ensues.[4] Coronary sclerosis and attendant myocardial scarring is also implied in the causation of hypertrophy. The hypertension is felt to be an accelerating factor in the sclerosing process and to explain the increase of sclerosis in hypertensives. In our series there was a total of forty-five (18.0 per cent) with no coronary sclerosis, the remainder of the patients showing some degree of this process. The distribution of this involvement and severity is shown in the following table:

DISTRIBUTION AND SEVERITY OF CARDIAC INVOLVEMENT

	No.	Per cent
None	45	18.0
Grade I	42	16.2
Grade II	74	29.6
Grade III	39	15.6
Grade IV	50	20.0

Eighty-two per cent of patients showed some degree of coronary sclerosis, the majority being of lesser grades of severity. The large number of patients so affected may probably be accounted for by the fact that many of them are in the older age groups and therefore the ones who are more likely to display degenerative changes. ECG data on eighty patients showed 66 per cent to have myocardial disease. Left axis deviation was diagnosed in thirty and left ventricular strain in nineteen cases, a total of forty-nine with left ventricular preponderance. Chest x-rays in seventy-nine patients showed sixty (75.9 per cent) to have increased size of the cardiac shadow and compares with the 71 per cent in Perera's series of 250 cases.

TABLE VII. RENAL INVOLVEMENT

	No.	Per cent
Glomerulo hyalin	45	18.0

Clinical uremia	32	14.7
BUN under 100 mg. %	5	2.2
BUN over 100 mg. %	15	6.9
Uremia (where deemed to be main contribution to death)	18	7.2
Goldblatt kidney	4	1.8

TABLE VIII. RANGE OF BUN LEVELS

Data on 117 (46.8%) patients

	No.	Per cent
10 mg. % and under	5	4.2
10–20 mg. %	45	38.4
20–50 mg. %	28	23.9
50–100 mg. %	23	19.5
100 mg. % and over	15	12.8
200 mg. % and over	1	0.9
Total patients with BUN elevation	67	57.1

Kidney involvement severe enough to account for death from renal failure has been found to be consistently the least common fate of hypertensives, most authors not reporting an incidence of more than 5 per cent. Patients developing renal insufficiency may, according to Bell, fall into one of three classes: (1) chronic hypertension with moderate renal insufficiency in which the patient usually dies from some extra renal cause; (2) chronic hypertension with slowly developing uremia, the small arteries showing marked intimal thickening, and arteriolar and glomerular hyalinization in varying degrees (grossly the kidneys are small and contracted); (3) chronic hypertension with acute uremia, which has been termed malignant because of its relatively rapid fulminating course and the consistent finding of marked collagenous thickening of the terminal arterioles and in a lesser number of cases a necrotizing type of lesion. Of our series only three were designated as malignant hypertension, the other cases of renal insufficiency being of a more chronic nature. The following table shows the incidence of renal arteriole involvement:

INCIDENCE OF RENAL ARTERIOLE INVOLVEMENT

	No.	Per cent
None	85	34.0
Grade I	49	19.0
Grade II	80	32.0
Grade III	26	10.4
Grade IV	10	4.0

Grades III and IV account for 14.4 per cent of involvement but do not show a consistent positive correlation with the thirty-two (32.7 per cent) patients who showed definite clinical signs of uremia. A total of 66 per cent showed some signs of nephrosclerosis with and without concomitant elevated blood metabolites. The data in this series is made somewhat invalid because of the discrepancy in the number of kidneys examined (all of them in the series) and the number of patients in whom blood-urea-nitrogen levels had been performed (117 out of 250 or 46.8 per cent). Arteriolar involvement seems to be a fairly consistent finding in autopsied cases but there seems to be no direct relation between the amount of involvement and the severity of the clinical symptoms of the hypertension. Some patients with

TABLE IX. NERVOUS SYSTEM INVOLVEMENT

	No.	Per cent
Cerebral hemorrhage	40	16.0
Cerebral thrombosis	28	11.2
Encephalomalacia (105 patients examined)	69	65.7

minimal renal involvement showed severe clinical symptoms, the converse also being found. In a study of 100 renal biopsies from surgical patients 53 per cent were found not to have sufficient organic renal disease to be the sole cause of the hypertension. After death from chronic hypertension, organic vascular lesions of the kidneys are found in practically all cases. If these biopsies can be assumed to be accurately representative of the renal vascular bed, it seems that the degenerative lesions seen after death are secondary to the hypertension and not a cause of it.[3]

	250	100.0	

After chronic renal disease, adrenal tumors, certain rare basophilic adenomas of the pituitary, and coarctation of the aorta, which account for 5 to 10 per cent of hypertensives, have all been excluded, the remaining 90 to 95 per cent fall into the essential group, which is the one at which the bulk of research is aimed in a quest for an etiology. The classical experimental work of Goldblatt in producing renal ischemia with resultant elaboration into the blood stream of vasopressor substances of renal origin the attempts to establish hyperplasia of the adrenal glands, the gross and sustained overactivity of the sympathetic nervous system, the various psychosomatic disorders with chronic emotional storms and tensions have all failed to explain the basic and inciting causes and mechanisms, and to provide the basis for development of a specific form of therapy. The most recent of the theories to explain the increased arterial pressure has been by Shorr and his associates.[15] They describe certain vasomotor excitor substances (VEM) derived from renal and hepatic tissues, and certain vasodepressor substances (VDM) which are thought to be derived from spleen, skeletal muscles, and liver. The VEM is produced as a result of altered kidney metabolism secondary to decreased renal oxygen tension, and is found in the peripheral blood stream during the time that the blood pressure is rising. The VEM is eventually neutralized by the antagonistic action of VDM by its appearance in the blood stream, with the eventual establishment of a neutral equilibrium between the two circulating factors at a higher level than prior to its elaboration. The cause for the persistance of the hypertension after this equilibrium has been established is still undetermined. These studies are still on an experimental basis and have no clinical application yet but may form a basis for the development of a specific anti-pressor substance. Excluding those very few cases where unilateral nephrectomy, removal of a pheochromocytoma or other adrenal tumor and in rare cases of surgery for coarctation of the aorta which may be of specific benefit, the treatment of hypertension in both medical and surgical phases is still basically symptomatic and palliative in type. There is no need to review the various criteria by which a patient is evaluated as a satisfactory candidate for surgery aimed at the ablation of certain components of the autonomic nervous system in efforts to break the chain of events leading to a sustained arterial pressure.[9,16] The role of barbiturates as sedators, the nitrites as temporary vasodilators, the thiocyanates as a controlled long range of vasodepressor type of medication are all well known. A drug formerly in disrepute to receive recent clinical reappraisal and being used by some recently is veratrum viride.[5] It has been found to be of value in cases of hypertensive encephalopathy and myocardial failure in acute hypertensive crises. Parenterally and orally it acts in one to two hours with a peak of action at four hours, but is disadvantageous because of the narrow margin between the toxic and therapeutic doses. Among the more promising of the

new agents are those which have as their common property a blockage of the sympathetically innervated vaso constrictors, in effect a chemically induced sympathectomy.[5] Dibenamine, a nitrogen mustard derivative with marked hypotensive properties but impractical for ambulatory therapy, and pentaquin, a derivative of plasmochin, have received experimental trial with equivocal results. The most promising of these agents has been dihydro-ergocornine (DHO 108). Responses with a drop in blood pressure have been noted with all routes of administration with sustained effects noted to be lasting from eight hours to several days. Toxic and undesirable side effects have been minimal. This drug is available for investigative purposes only, clinical experience being limited at the present time to evaluation of its potentialities.

Our present methods of therapy, directed as they are at the relief of symptoms and palliation are of value in rehabilitating some patients and allowing them to lead useful lives but at a lower level of activity. Successful lowering of the blood pressure must not be construed to be a sign of regression of a disease process which has a sustained hypertension as a secondary effect. The ultimate goal of research will be to supply the physician with a substance which will be as specific for essential hypertension as the present antibiotics are for the treatment of bacterial infections.

Summary

1. Statistics obtained from the St. Luke's patient series and national figures correlate only insofar as showing the incidence and predominance of hypentensive cardiovascular disease over malignant neoplasm as a cause of death.

2. Pathological physiology and possible mechanisms of production of essential hypertension have been discussed.

3. Two hundred fifty necropsy cases at St. Luke's Hospital over a five-year period have been reviewed relative to age groups, incidence of cardiovascular, renal and central nervous system involvement, clinical manifestations, laboratory data, and mode of exodus.

4. Several new drugs promising in the treatment of hypertension have been mentioned.

THREAT TO FREEDOM

There impends today a stupendous threat . . . in the fact that our country, without opportunity for conscious choice on the part of its people, is rapidly drifting toward the consummation of a false concept—contemptible to free men—the socialized state. . . .

Tokens of this danger are everywhere and undeniable. The growing power and expansion of a wasteful Government . . . colossal public debt . . . heavy burden of taxation . . . ridiculous attempt—by dictating wages, hours of labor, prices, . . . and by innumerable other false expedients—to substitute an artificial economy for the natural economy which alone can function in freedom . . . gradual assumption by the state of financial, responsibility for every hazard incident to life, labor, infirmity, and old age . . . alignment of economic and social groups one against the other. . . .

The present semblance of "prosperity" is only the byproduct of the most terrible and destructive war that ever afflicted the world, and is now maintained only by artifice implemented by folly, fear, and dire forebodings.

. . . we call on all patriotic Americans to denounce them (these policies and politicians who support them) and to work energetically and courageously for the reestablishment and maintenance of free and competitive enterprise and the restoration of the Republic.—*New York Daily News,* March 27, 1950.

THE PLANS OF MEDICAL STUDENTS FOR PRACTICE

MYRON M. WEAVER, M.D.
Vancouver, British Columbia
and
HAROLD S. DIEHL, M.D.
Minneapolis, Minnesota

THERE is widespread interest about the plans of present-day medical students for future practice. This is to be attributed in part to the apprehension which has existed for a half-century or longer[6] that specialism will eventually eliminate the general practitioner, a contingency which was thought by some to be fairly imminent when the postgraduate wishes of medical officers were summarized early in 1945 by Harold C. Lueth.[7] His report and data published subsequently[5] lent credence to the prediction of Weiskotten[14,15] in 1932 and earlier, that 70 per cent of the medical graduates each year will eventually limit their practice to a specialty. The tendency to limitation of medical practice within restricted fields exaggerates the need for adequately trained and experienced general physicians, according to Walter L. Bierring,[1] who feels that this constitutes one of the most important problems facing the medical profession and the medical schools, as well as all those agencies concerned with public health.

There have been various reassurances that the general practitioner is not "doomed,"[2,3,4,8] and his future appears considerably brighter each day because his importance is being constantly re-emphasized, his relationship to hospitals is improving and more opportunities are being afforded him for self-improvement. His own Section on the General Practice of Medicine in the American Medical Association and his American Academy of General Practice will help him to put his own house in order and to set standards which will be sufficiently high to cause him to obtain proper satisfaction from his own particular role in medical practice.

Possibly the brightest aspect of general practice is the attitude exhibited by recent graduates in medicine. In the Educational Numbers of *The Journal of the American Medical Association* in 1948 and 1949,[9] polls concerning the plans of medical students were reported. These polls suggested that an idea which has achieved rather wide acceptance should be corrected: this is that few present-day medical students are planning to enter general practice.

QUESTIONNAIRE

1. Do you intend to be a practicing physician? Yes.... No....
2. If you find yourself able financially, how many years of hospital training, after internship, will you undertake? One.... Two.... Three.... More than three.....
3. Do you plan eventually to be certified by a specialty board? Yes.... No.....
4. Would you prefer to engage in solo practice...., small clinic practice...., large clinic practice...., industrial medicine...., Government service...., other........?
5. What annual net income have you set for your goal? $.........
6. According to your present inclinations, would you wish to practice in Minnesota...., the Middle West or Northwest...., a distant state...., or in a foreign country....?
7. Is your family resident in Minnesota? Yes.... No.....
8. Provided adequate hospital facilities were available and the prospects for adequate remuneration and reasonable working hours were good, check the size of the community in which you would prefer to practice medicine: 1,000 or less...., 1,000 to 5,000 ...., 5,000 to 50,000...., over 50,000.....
9. What was the population of the community in which you were reared? ....
10. What form of remuneration would you prefer to receive: Salary for full-time...., fees from private practice...., combined part-time salary, or other steady income, plus part-time private practice......?
11. Would you be averse to participation of government in the financial and administrative aspects of medical practice? Yes.... No.....

At the University of Minnesota Medical School, systematic questioning of senior medical students was undertaken in June, 1944. A relatively simple questionnaire was adopted, as shown. Some of the data collected were mainly of local interest. This was especially true of the inquiry as to how many recent graduates plan to remain in their home state, what types of practices they contemplate, the geographic location and size of communities which they desire for practice, and the incomes they hope to achieve. After surveying two classes of senior students it was decided to determine how the thinking of the fourth-year students compared with that of first-year students.

Dr. Weaver is Dean of the Faculty of Medicine, University of British Columbia, Vancouver, B. C.

Dr. Diehl is Dean of Medical Sciences, University of Minnesota, Minneapolis.

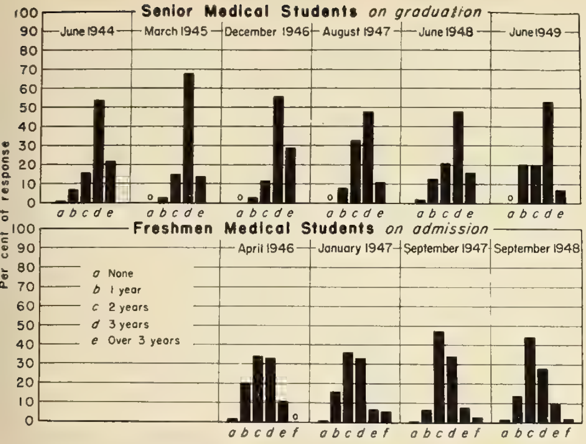

Fig. 1. Hospital training desired beyond internship.

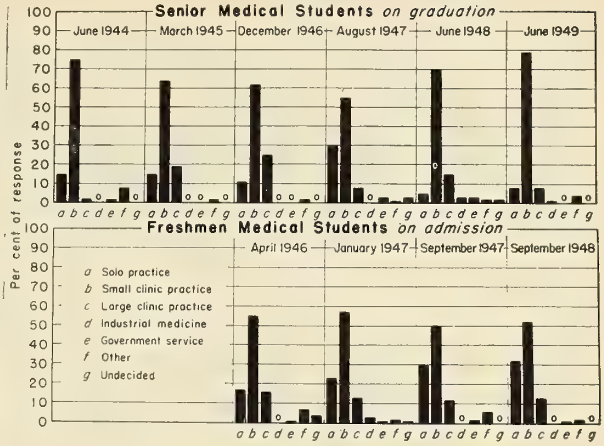

Fig. 3. Type of practice preferred.

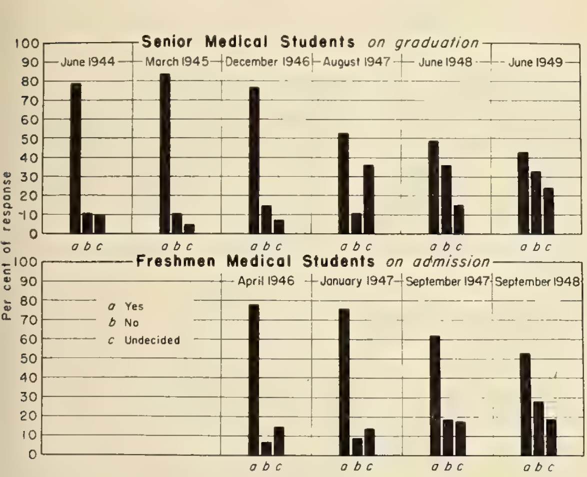

Fig. 2. Intentions to seek specialty board certification.

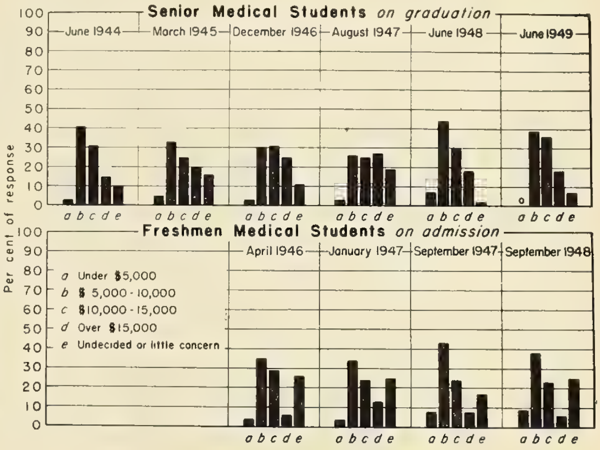

Fig. 4. Income goals.

Intention to be Practicing Physicians.—In the classes of seniors between 1944 and 1949, 99, 99, 98, 97, 97, and 98 per cent of the students, respectively, 98, stated they intended to engage in medical practice. Among the first-year students from 1946 to 1948, 93, 93, 96 and 100 per cent, respectively, of those answering the questionnaire stated they expected to be practicing doctors.

The seniors who responded to the questionnaire in the years between 1944 and 1949 numbered 117, 93, 97, 73, 61 and 85. The freshmen who responded to the questionnaire between 1946 and 1948 numbered 82, 97, 119 and 124 respectively.

Hospital Training Desired Beyond Internship.—Almost without exception, the upper class and entering students hoped to be able to undertake an extended period of hospital training beyond their internship, as shown in Figure 1. This supports the statement of William A. O'Brien[11] that the majority of recent medical graduates do not wish to enter any kind of practice without further training beyond a year's internship. It was his belief that graduates in medicine today do not feel it is possible to master the medical knowledge they require in five years. This was a determining factor in the establishment of two-year internships for general practice under the direction of the University of Minnesota Medical School.[13]

Intentions to Seek Specialty Board Certification.—Figure 2 indicates how student interest in securing specialty board certification has declined in the postwar period. At all times during the past several years the aspirations of fourth-year and first-year medical students have corresponded very closely in this respect. An opinion is ventured that registrants in medical

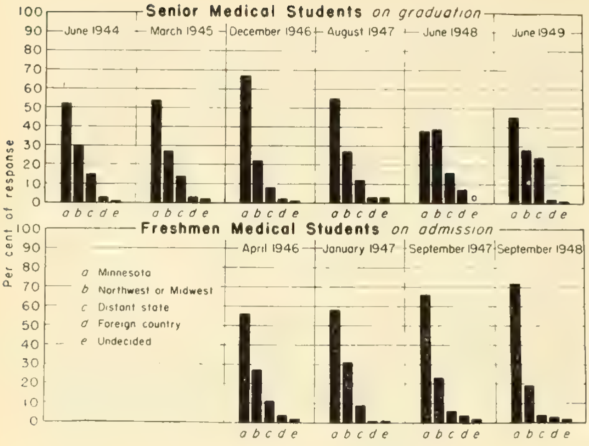

Fig. 5. Intentions as to residence.

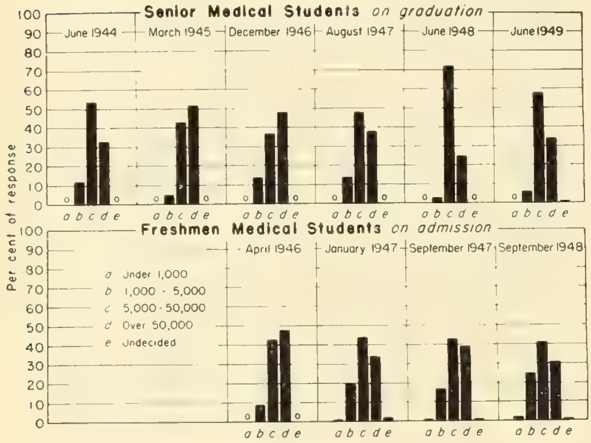

Fig. 6. Sizes of communities desired for practice.

schools have well-formulated intentions about their professional careers in advance of any presumed influence which results later from the examples set by clinical medical teachers or experiences gained in specialized hospital services.

Type of Practices Preferred.—One striking feature of Figure 3 is the popularity of the idea of practice in a small clinic. This trend in student preferences becomes increasingly apparent as the medical course progresses. At the time of questioning, the senior students in this survey had not yet participated in the class discussions conducted by guest lecturers who each year present to the students the opportunities of solo medical practice, of small and large clinic practice, of industrial practice, and of the governmental services, including the Medical Corps of the U. S. Army, Navy and Public Health Service.

TABLE I

	1944	1945	1946	1947	1948	1949
Percentages of Seniors with Families Resident and Non-Resident in Minnesota						
Resident	83	90	89	96	56	89
Non-resident	17	10	11	4	44	11
Percentages of Freshmen with Families Resident and Non-Resident in Minnesota						
Resident			83	86	87	87
Non-resident			17	14	13	13

TABLE II

	1944	1945	1946	1947	1948	1949
Percentages of Seniors by Years						
Size of Community Where Reared:						
Under 1,000	16		12	12	18	16
1,000 to 5,000	22		18	21	23	37
	——38		——30	——33	——41	——37
5,000 to 50,000	23		20	23	26	18
Over 50,000	39		50	44	33	45
Percentages of Freshmen by Years						
Under 1,000			12	9	20	13
1,000 to 5,000			12	21	18	18
			——24	——30	——38	——31
5,000 to 50,000			28	21	18	17
Over 50,000			48	49	44	52

Income Goals.—Upper classmen in the past few years appear to have developed somewhat greater financial ambitions than they exhibited formerly, although the number aspiring to definitely high incomes has not changed greatly since the war (Fig. 4).

Intentions as to Residence.—The returns represented by Figure 5 are consistant except in the case of the senior class in 1948. This class contained relatively large numbers of non-residents of Minnesota, and students whose families lived at a distance (Table I).

Sizes of Communities Desired for Practice.—The thinking of seniors and of first-year students as to the sizes of the communities which they prefer for practice is shown in Figure 6. Table II shows the sizes of communities in which the students of these several classes were reared.

Types of Remuneration Desired.—The intention was to distinguish the students who contemplate salaried positions versus whole-time private practice, and to reveal those students who aspire

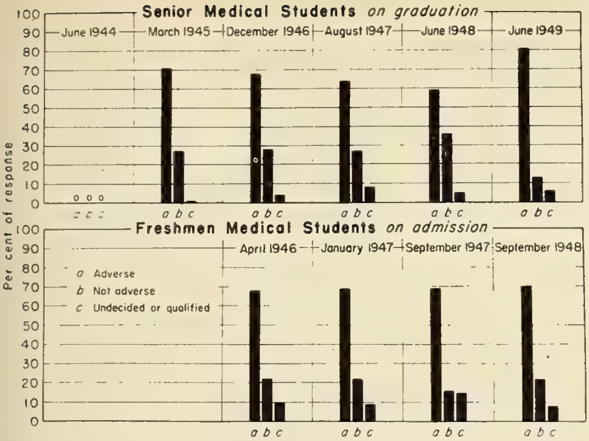

Fig. 7. Types of remuneration desired.

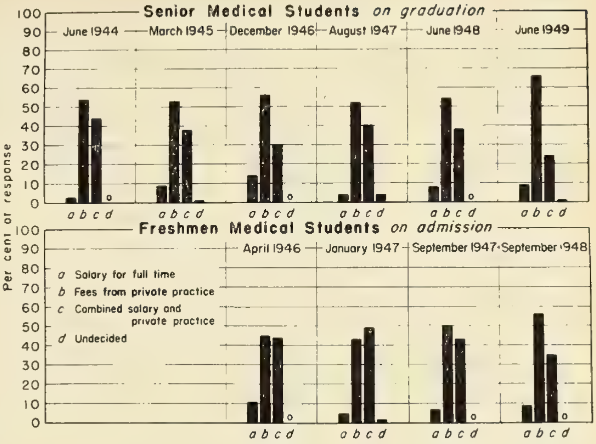

Fig. 8. Attitudes on government participation in medical care.

to a combination of medical teaching and private practice (Fig. 7).

Attitudes on Government Participation in Medical Care.—The consensus of each class appears clear (Fig. 8).

Summary

A survey extending over several years was conducted to determine the plans of medical students at one institution and appears to support the following conclusions:

Nearly every student wishes to undertake considerable hospital training beyond his internship. The principal limiting factors usually prove to be the financial stringency and unavailability of proper hospital appointments, rather than considerations of specialty practice versus general practice.

The present-day medical student seems fully to appreciate the advantages of clinic or other group practice.

In spite of prospects for good hospital facilities in small communities, recent medical graduates and students in the earlier years of the medical course continue to exhibit a preference for urban centers as they contemplate entering upon their medical practices.

First-year and fourth-year medical students are remarkedly alike in their plans and aspirations for future practice.

SOCIAL AGENCIES AND TUBERCULOSIS CONTROL

The health officer responsible for tuberculosis control in his area, as an integral part of his work, should develop an understanding and working relationship with the social agencies in his community. Such a relationship would certainly benefit both agencies. The social agency will gain an insight into the specialized medical and public health problems associated with tuberculosis control, and the health agency will have an opportunity to see the positive contributions which social workers and social agencies can make toward the effective management of tuberculosis patients. Robt. J. Anderson, Chief, Div. Tuberc., *Public Health Report,* Dec. 2, 1949.

CHALLENGING PROBLEMS AND DEMANDS OF THE AGED AND CHRONICALLY ILL

J. A. LEPAK, M.D.
Saint Paul, Minnesota

THE STUDY of the growth and development of the human race shows that the percentage of the population of the earth in the old age group is gradually increasing. Wars, disease and famine have, sometimes for short intervals, interrupted the steady augmentation of the older group. Today Brazil, India, Japan and U.S.S.R. are considered young; Canada, Italy, Spain and the U. S. A. are relatively young; while England, France, Germany and the Scandinavian countries are senescent. The French population suffers most among nations from old age. Since the aged are more prone to suffer from chronic disease than the young, the community must plan to provide ever increasing facilities for the care of the chronically ill. The most important or essential needs affecting the aged and chronically ill doubtless lie in the social, economic and medical fields. It behooves the medical profession, therefore, to consider the problems and demands emanating from the increase in the chronically ill and aged in order to aid the sociologists and economists in their solution.

The average life span of prehistoric man was eighteen years. During the height of the Roman Empire it rose to twenty-two years. In the Middle Ages it reached thirty years. In England it climbed to forty-one years during the middle of the nineteenth century. In 1900 the average length of human life in the United States was forty-nine years; in 1945, 62.5 years, and in 1949, over sixty-five years. The span of life varies too in different countries, depending on the progress of medical sciences, social welfare and economic growth and development.

While chronic illness is found in every decade of life, it is much greater in the later decades. It is estimated, for the country as a whole, that for the population over sixty-five years of age its incidence was 6.8 per cent in 1940, will be 7.9 in 1950, 10.2 in 1960, 11.9 in 1970 and 14.4 in 1980.

Adapted from Table 4, “Current Mortality Analysis,” Volume 5, Number 13 (August 27, 1948); Federal Security Agency, and National Office of Vital Statistics, Washington 25, D. C. In “How to Live Longer,” by Justus J. Schifferes.

The increase in life expectancy is attributed to reduction in infant and maternal mortality, less immigration, better living standards and advances in public health and medical science. The death rate in the United States demonstrates this improvement. In 1900, per 1,000 population the death rate was 17.2 per cent; in 1910, 14.7; in 1920, 11.3; in 1930, 10.7; and in 1947, 10.1 per cent.

The life expectancy in the United States, as

TARLE VI. ESTIMATED NUMBER OF INVALIDS DISABLED BY CERTAIN CHRONIC DISEASES IN U. S., 1937

Nervous and mental diseases	269,300
Rheumatism	147,600
Heart disease	144,200
Tuberculosis—all forms	77,900
Arteriosclerosis and high blood pressure	60,900
Diabetes mellitus	34,300
Nephritis and other kidney diseases	31,000
Asthma	29,200
Cancer and other tumors	28,100
Diseases of female organs	18,500

TABLE VII. PROBLEMS OF HOSPITAL PROGRAM

1. Quantity for every 1,000 people, 4.5 beds in general hospitals
Quantity for every 1,000 people, 2. beds for chronically ill
Quantity for every 1,000 people, 5. beds for mental patients
Quantity for every 1,000 people, 2.5 beds for tuberculosis patients
2. In 1948:

Type of Hospital	Existing beds	No. beds needed
General	467,000	260,000
Mental	429,000	307,000
Tuberculosis	84,000	85,000
Chronic	39,000	246,000
Total	1,019,000	904,000

Source: United States Census Bureau.

estimated by the Metropolitan Life Insurance Company, is shown in Table I.

In 1900 deaths from tuberculosis headed the list. Today tuberculosis is in seventh place. Pneumonia deaths were in second place; now, they are in sixth place (Table II). Cancer, accidents and cardiovascular diseases, however, have gone way up as the cause of deaths (Table III).

From Table V it can be seen that the incidence of chronic illness and invalidism increase progressively with age.

The six most common diseases causing invalidism in sequence are: nervous and mental diseases, rheumatism, heart disease, tuberculosis, arteriosclerosis and high blood pressure and diabetes. If heart disease, arteriosclerosis, high blood pressure and some cases of nephritic disease and rheumatism were combined under the term "cardiovascular diseases," then this group would occupy the first place (Table VI).

Chronic disease, except for severe economic national depressions, is the greatest single factor forcing people onto public assistance rolls.

Although the fate of the chronically ill and aged is frequently deplorable, it is often worsened by certain existing discriminatory practices in our social order. Urban industrialization has enticed the youth from the country to the cities. Today the population on the farms is less by 20 per cent than in 1920. Industry wants, as a rule, the young, strong and alert. Youth and the old are excluded. Economic and legislative compulsion have shortened the years of work.

During the depression, the youngest and oldest workers suffered most. Despite the excellent record and enormous capacity of workers in the fifties and sixties during the war shortage of manpower, industries continue to place unabatingly more and more employes on the retired list between the ages of sixty and sixty-five. Age, rather than the physical and mental status, too often determines when a worker is retired. As the population grows older and older, the gap between the span of life and working span, likewise, becomes wider and wider. Today his life expectancy is sixty-seven, working years forty-one and retirement 5.5 years. In 1975, if the trend persists, the span of retirement will be ten years.

Much has been spoken and written about the Federal Aid Insurance Program, part of the Social Security Act (1935) and later amended or changed by the 1939 Congress, but the benefits from this source are too small to be effective. In December 1947 the average benefit was $24.90, and average worker and wife received $39.60, widow and two children $48.00, and an aged widow $20.40. In addition to the inadequate benefits, the unduly restricted eligibility does not cover domestic servants, housewives, unskilled labor, clerks, professional individuals and many older workers. Current legislative movements favor coverage for practically all persons, a liberalized insurance status, a very substantial increase in benefits and the payment of cash benefits to the permanently and totally disabled.

If two-thirds of the deaths in the United States are due to chronic disease and 40 per cent of them occur under sixty-five years, and two-thirds with chronic disease are under sixty-five years, reduction of chronic disease rates first in the medical program. The ever increasing number of the aged only complicates and enlarges the picture. In different parts of the world, very different treatments have been accorded to the old. Chinese society, based on ancestral worship, stability, continuity and conservation, honored the period of old age. The Eskimos in the northwestern part of North America, facing a bitter struggle in a frigid environment, considered the aged a drain on their provisions and hence expected or encouraged them to wander off and die. In Labrador the Eskimos quietly dispatched the old. In Africa the Bushmen left them behind when moving camp. The Hottentot carried them to solitary huts and left them with meager provisions. The United States with its accent on youth, growth and speed has for the most part only ignored old age. Since the problems of old age and the chronically ill are gaining greater and greater prominence with each decade and the past solutions appear impractical in this age, it is necessary to explore means, first, that can be marshalled for immediate relief, and second, that can be initiated to meet future needs.

Today one-half of the population is over thirty years. In 1800 one-half of the population was over sixteen years. Now 10,000,000 people are over sixty-four years. By 1975, it is estimated 20,000,000 will be over sixty-five years. In 1975 one-third of the population will be over forty-five years, while in 1900 only 18 per cent was. Chronic disease accounts for 75 per cent of all the invalidism and partial disability in this country (about 2,500,000 invalids and 10,000,000 partially disabled). More than one-half of the chronically ill are under forty-five years. Between the ages of forty-five to sixty-four, chronic disease is four times as frequent as between fifteen to twenty-four years. More than 25,000,000 people or one-sixth of the population have chronic disease.

About 40 per cent of physicians' services are rendered to chronics, while three out of every four hospital patients in the United States are hospitalized for chronic physical or mental illness. Poverty and chronic illness often walk side by side. Persons on relief suffer from disability three times as frequently as persons with family incomes of $3,000 and over. Facilities for the chronic and convalescent are developed very poorly in the United States. In this country in 1930 there were set aside for this purpose 7.1 beds per 100,000 while England enjoyed 53.6 beds. In 1947, there were 12,210 beds in twenty-nine states, but 70 per cent of them were in four states, namely, California, New York, New Jersey and Pennsylvania, while 20 per cent were in eight states, i.e., Illinois, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Ohio and Washington.

The aged and chronically ill, it would appear, ought to interest the medical profession not only from a strictly scientific aspect, such as improving health and preventing, curtailing or treating disease, but also from the fact that if this group of the population does not receive proper medical care in the home, nursing home or hospital, the state and federal government will encroach more and more on the rights and privileges of the average medical practitioner. In other words the medical profession should aim to keep the aged at work as long as possible and the chronically ill rehabilitated wherever feasible. At the present time facilities for retraining, rehabilitation and occupational, physical and educational therapy are sadly neglected. These measures should receive the hearty endorsement of the whole profession. The aged, too, in an appropriate occupation ought to be retained by industry or any other employing agent, despite reaching the usual retirement age of sixty or sixty-five, as long as they are capable.

This change in policy would reduce the span of years in retirement or unemployment and thus add more comfort to the old and decrease the economic burden of maintenance on the community, state and federal governments.

Recent surveys in various cities and states reveal a great deficiency of hospitals, physicians and nurses as well as nursing homes and homes for the aged with the necessary personnel. Boarding and custodial homes and various private institutions for the aged or chronically ill are also deficient and many need much renovation before they may be acceptable. A recent New York survey gives startling figures of deficiency in all their institutions and personnel.

In 1948 the United States Census Bureau revealed that 39,000 existing beds were allotted to the chronically ill, while 246,000 actually were needed in the various hospitals of the country (Table VII).

Even this brief, general and very inadequate exposition of the problems emanating from the ever increasing number of the chronically ill and aged demonstrates that an adequate solution will be difficult, prolonged and expensive. It will call for a co-operative spirit and effort among all groups in our social order extending from the local community and state to the federal levels. Some parts of the country are awake and aware of these problems. Cities like Baltimore, Chicago, Milwaukee, Philadelphia, New York and St. Louis, as well as the following states—California, Connecticut, Illinois, Indiana, Maryland, Massachusetts, Minnesota and New York—have already created definite plans, some of which are either operating or under study for co-operative action while others are undergoing construction to meet the immediate needs and future demands or contingencies.

Provisions have been made for home care, nursing homes and hospitals including the training of the proper personnel for all respective places. At the hospitals, especially those attached to teaching institutions or medical schools, a definitely outlined research program has been either inaugurated in some or planned for in other institutions. Every effort has been explored, studied and undertaken also to educate the public not only how to cope with the present emergencies but also to throw light on methods and measures employed to make chronic disease and old age more useful and less miserable It is estimated that early medical services would reduce chronic disease by 20 to 30 per cent. If physical therapy and re-occupation or rehabilitation, as its advocates claim, would reduce dependency in chronic disease by another 20 per cent, then the family, city, community, state or federal government would experience a marked financial reduction in the care of this group.

Now let us glance at Minnesota.

While some communities and states started earlier to study and evaluate the various problems and demands accompanying the chronically ill and aged, Minnesota made up for the delay once it undertook the job. The 79th Congress in passing the Hospital Survey and Construction Program gave additional impetus to the task. The federal legislation authorized an annual grant to the states over a five-year period to assist in constructing and equipping needed hospitals and public health centers, provided a state submitted an over-all plan for approval. Such an initial plan was completed in 1948 and revised with priorities in 1949. In general, the whole project is financed, two-thirds by the community and state and one-third by the federal government. The law provides for Federal-state co-operation and designates the United States Public Health Service as the Federal administrative agency. "In Minnesota, the State Board of Health is charged by chapter 485, Laws of Minnesota, 1947, with responsibility for co-operation with the United States Public Health Service in the conduct of the program. The Federal law required planning of facilities in each of the following five categories of institutions: General and Allied Special Hospitals, Chronic Disease Hospitals, Mental Disease Hospitals, Tuberculosis Hospitals and Public Health Centers." Accordingly, brief studies and evaluations of facilities were made; first, of the homes for the aged and the chronically ill: second, a rather comprehensive and detailed report of the existing hospital beds and facilities followed with a five-year plan for future construction of hospitals and public centers needed to comply with the Federal regulations and stipulations.

The homes for the aged numbered forty-eight, with a bed capacity of 3,228. Only forty-two homes had a capacity of twenty-five beds or more. Forty-three homes were maintained by corporations. The Minnesota Soldiers' Home, state owned, had 395 beds for men and 120 beds for women. Four homes were maintained by counties, with a total of ninety-eight beds.

There are 174 homes totalling 3,543 beds for the chronic and convalescent in Minnesota. Only twenty-nine homes have a capacity of twenty-five beds or more. Eight homes are maintained by corporations, 160 by individuals and six by counties. The counties combined have 275 beds. It is well to note that some of these homes have already discontinued to operate since the investigation took place. Others will have to be remodeled and undergo variable changes to meet the necessary and minimum requirements of fire hazards, frequent accidents and health provisions. Under such circumstances the bed capacity has been very much reduced and will continue to decrease as the various public safety departments get more and more interested and enforce their respective regulations in the homes and hospitals for the aged and chronically ill.

In order to understand and appreciate what hospital facilities are present or planned for the aged and chronically ill, it is necessary to review briefly the requirements and demands laid down for all the health institutions by the United States Federal Health Services. This legislation specified that hospitals shall be divided into five categories, namely: (1) general and allied special hospitals including orthopedic, pediatric, contagious: ear, eye, nose and throat, obstetrics and gynecologic services; (2) mental disease hospitals; (3) tuberculosis hospitals; (4) chronic disease hospitals and (5) public health centers.

The General and Allied Special Hospitals, based on the 1947 census of Minnesota population of 2,888,000, should contain 12,966 beds, allotting 4.5 beds per 1,000. The state of Minnesota is divided into eleven regions. In this group the hospitals are divided into a base hospital, eleven regional hospitals, seventy-five intermediate area hospitals and 43 rural hospitals. The most efficient co-operative and co-ordinative efforts and policies are to exist among these institutions. The University Hospital with the Twin Cities Hospitals is designated as the base area. Outside of the Twin Cities are the eleven regional hospitals dependent on and co-operating with the base institutions. The intermediate area hospitals are obliged to depend on the regional, and the rural again on the intermediate area hospitals. The base hospitals with their various research and teaching centers will enjoy the largest bed capacity. In the rural parts the hospitals will be small and have only 2.5 beds per 1,000 and take care largely of common illnesses, injuries and obstetrics. In the allocation of these various hospitals many factors were considered such as distance (forty miles between hospitals), population guide, bed deaths and bed births ratios, accessible roads and existing hospitals. The total beds needed in this group is 12,996. There are now 8,665 acceptable beds.

The Minnesota Mental Disease Hospital Plan, based on five beds per 1,000, requires 14,440 beds. At present there are only 7,789 beds.

Tuberculosis Hospital Plan, allotting beds numbering two and a half times the average annual number of deaths per 1,000 over a five-year period, should have 1,630 beds. The inventory shows 1,995 beds. When two institutions which normally house sixty-five patients are closed, there will still remain 1,930 beds.

The Minnesota Plan for Public Health Centers (1949) provides for one center per 30,000. Appropriate legislation is needed to endorse and authorize the recommendation. There will then be eleven centers. There are three at the present time.

Finally comes the Minnesota Chronic Disease Hospital plan. These hospitals, wings of a hospital or segregated units adjoining a general hospital, are intended to provide medical care for chronic invalids. Alloting two beds per 1,000 population, Minnesota is entitled to 5,776 hospital beds. It has 598 beds. The 1946 hospital survey showed 128 homes and hospitals with a capacity of 2,839 beds. The homes gave only monthly domiciliary care. In 1948 a final analysis indicated that there were only 598 beds. In rural areas 1.5 beds per 1,000 will be allocated in existing or to be built general hospitals. In the Twin Cities 2.5 beds per 1,000 or more will be allowed where research, teaching and special care can be rendered more readily when required and necessary. There will be hospital beds and facilities in sixty-seven hospitals divided into thirty-seven areas or locations to meet the convenience of travel, medical health centers and distribution of population. The Ancker and Minneapolis General Hospitals, as teaching institutions, will proportionately have a substantial increase in bed capacity. The guiding principles for this plan are to locate the hospitals as near as possible to those needing them, to take in account the urgent desirability of constructing units in conjunction with already existing general hospitals for more efficient diagnosis, treatment and economy and finally to look forward to superior means, methods and equipment for administering physical therapy and occupational rehabilitation.

Since there is not only a shortage of hospital beds but also of trained personnel for the future needs in such hospitals, priorities will be given to the construction of sub-units of general hospitals and projects operating as units of teaching hospitals for training personnel for the future needs in chronic disease hospitals. Next, regional hospitals will be built, around which later the remaining units should follow.

When the Minnesota Chronic Disease Plan gets well under way, and perhaps long before the five-year period is passed, there will be a tremendous improvement in the care and welfare of the aged and chronically ill. Its association with the University of Minnesota Medical School will greatly aid the growth and development of the movement. Research in chronic diseases and old age should also advance more readily, because of the proximity of the other various research medical centers like the cancer, arthritic, pediatric and cardiac institutions for the exchange of ideas, facts and experiments.

It is apparent, however, that Minnesota, in order to give satisfactory care to the aged and chronically ill, needs more: (1) hospital beds, (2) physicians, nurses and trained personnel for this purpose, (3) nursing homes with proper supervision and licensing to protect the ill from social, economic and medical abuses, exploitations or hardships, (4) housekeepers, social workers, nurse's aids, et cetera, who would help the ill and aged in their homes, (5) research into chronic disease and the aged, (6) appropriate legislation extending from the rural districts to the state capitol to facilitate the aims, means and measures advocated by those well trained and appointed to accomplish the task.

Conclusion

1. It has been shown that the percentage of the chronically ill and aged is increasing with time.

2. The increase is caused largely by a reduced infant and maternal mortality, improved drugs, better medical care, more restricted immigration, better living standards and various scientific advances.

3. The increase in the chronically ill and aged creates problems and demands in the community which are more social and economic than medical.

4. Adequate solution of these problems depend on several sources: (1) the community, state or federal government, (2) education and co-operation of all the groups in our social order, (3) medical personnel to serve in hospitals, nursing homes, rest homes or ordinary homes.

5. A brief account has been given of the immediate needs and future plans in a few large cities and states for the chronically ill and aged.

6. Finally, a résumé of the Minnesota Plan for Hospitals and Public Health Centers is discussed insofar as it concerns primarily chronic disease hospitals and future plans.

(For discussion, see Page 518)

AUTOMOBILE ACCIDENTS

There were fewer automobile accident deaths on streets and highways of the nation last year than in 1948, but more injuries, according to figures released recently by The Travelers Insurance Companies.

Fatalities in 1949 totaled 31,800, compared with 32,200 in 1948, the companies reported, but injuries last year soared to an all-time high of 1,564,000. The 1948 figure was 1,471,000 injured.

These statistics are highlights of "Maim Street," sixteenth in an annual series of traffic safety booklets issued by The Travelers. The Hartford insurance firm maintains an accident statistical bureau which collects and analyzes accident data from the forty-eight states.

Excessive speed headed the list of accident causes in 1949, as it has in most recent years. "Exceeding the speed limit" caused 10,100 deaths and 398,700 injuries in 1949, according to the booklet. "Speed was a greater factor in traffic casualties last year than at any time in history," the report states.

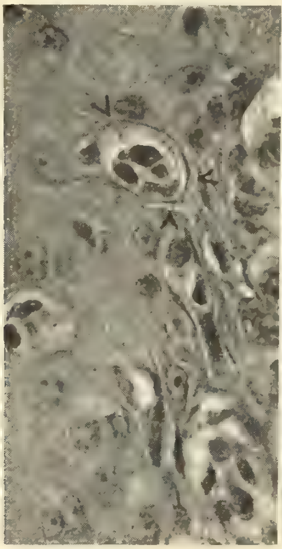
There were 890 fewer fatalities among pedestrians in 1949 than in 1948, but 180 more persons were killed crossing streets between intersections last year than in 1948.

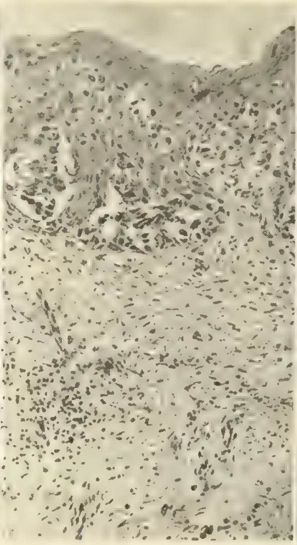
Last year, for the first time since the war, the percentage of 18- to 24-year-old drivers involved in accidents took a downward turn. "Youthful drivers, however, are still the cause of thousands more deaths and injuries than their numbers warrant," the booklet declares.

MELANOMATA AND NEVI

ARTHUR H. WELLS, M.D.
Duluth, Minnesota

NEOPLASMS of the pigment cells of man have stimulated the interest and imagination of physicians from the time of Hippocrates. Dupuytren, Laenec, Norris, Carswell, Paget, Virchow, Handley, Unna and Pringle are among the early authorities. Ever increasing numbers of important contributions have appeared in the first half of the twentieth century. Those of Masson, Pack, Becker and Allen are particularly outstanding. Probably no other subject in the field of oncology has created so much mystery, misunderstanding and difference of opinion as that of the "black cancer." The cloud of ignorance about this subject is slowly being dissipated.





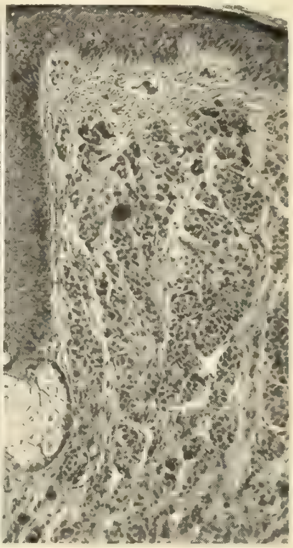


Fig. 1. (*left*) Melanoma. Arrows indicate prickles of ring of fused cytoplasm of epidermal cells which have changed to melanoblasts.

Fig. 2. (*center*) Junction nevus. Clear cells in epidermis.

Fig. 3. (*right*) Intradermal nevus. Clusters of clear cells in the dermis.

Histogenesis

Two theories of origin of melanomata are important. The neuralist concept of Masson[21] has been the most popular. Unna's theory[38] of epidermogenesis is possibly the most widely accepted by histopathologists. Repeated critical analyses of the transitions of epidermal cells into melanoblasts in melanomata of the skin leaves little doubt concerning the intimate relationship of these two cells. This metaplasia results in a separation or retraction of the nucleus with a narrow rim of protoplasm from the outer border of cytoplasm) frequently leaving the prickles intact. Thus single or small groups of melanoblasts are found inside a fused ring of protoplasm with the prickles of the original epidermal cells present (Fig. 1). Melanomata of the skin are carcinomas in spite of their occasional sarcomatous appearance.

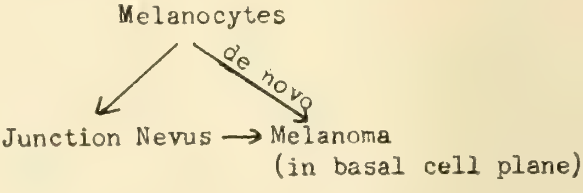

Fig. 4. Histogenesis of melanoma.

It is now agreed by the principal authorities that the "melanoblast," a matured cell hereinafter called melanocyte, is the precursor of both pigmented nevi and melanomata. The blastomeric origin of this cell is *the point* of disagreement. Melanocytes when stained by Bloch's "dopa" technique appear as dendritic cells lying among

---

From the Department of Pathology, St. Luke's Hospital, Duluth, Minnesota.

the palisaded basal cells of the epidermis.[21] They can be stimulated to increase in numbers and to greater pigment production by ultraviolet, alpha, roentgen and radium rays.[9] They are found in increased numbers in Addison's disease and other maladies. They form pigment granules and apparently distribute these granules to the basal and other cells.[21] Melanin pigment is a polymer of oxidized tyrosine and related chemically to adrenalin.[16] When the melanocytes are stained with hemotoxylin and eosin, they appear as clear cells "cellules clares" (Fig. 2). It is generally agreed that this cell is the parent of the nevus cell in all of its bizarre morphologic forms, including the whorls sometimes referred to as attempted formations of Wagner-Meissner nerve endings. In nevus morphogenesis it is also generally believed that the nevus cells migrate downward "abtropfung" from the epidermis into the dermis.[3] A substantial proof of this lies in the fact that 98 per cent of nevi in children have the nevus cells in the epidermis, that is, junction nevi (Fig. 2), while only from 12 to 25 per cent remains as junction nevi in adults.[36] In the remainder the nevus cells are all subepidermal or intradermal nevi (Fig. 3). Melanomata of the skin most often develop in junction or compound nevi; occasionally they appear to begin *de novo* without a preceding lesion. This transition originates in the palisading basal cell plane of the epidermis and rarely if ever in the dermis not involving the epidermis (Fig. 4).

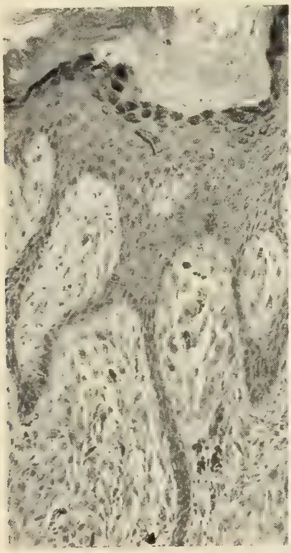

Fig. 5. (*left*) Juvenile melanoma.

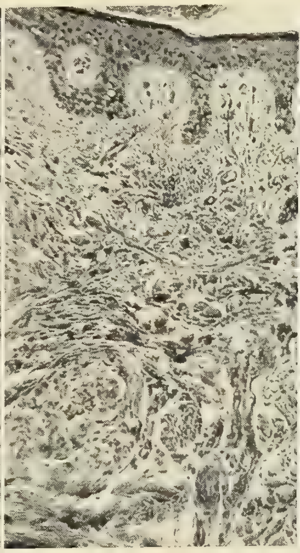

Fig. 6. (*center*) Blue nevus. Trabeculi of slender black cells running parallel to epidermis are the melanocytes.

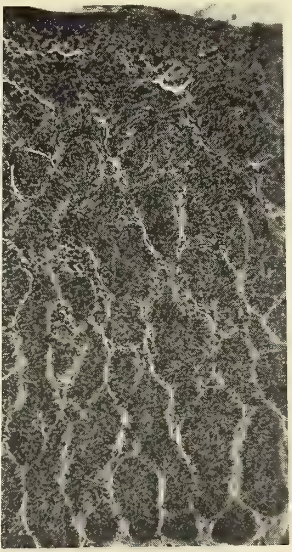

Fig. 7. (*right*) Basal cell carcinoma. Columns invading the corium.

Classification

Allan's histologic classification[3] of nevi (Table I) is combined with a widely used clinical classification.[30] The junction nevus (lentigo maligna) has nevus cells confined to the epidermis (Fig. 2). Those lesions where the nevus cells are in the dermis alone are intradermal nevi (Fig. 3) while a mixture of the two are compound nevi. Juvenile melanoma (Fig. 5) has the histologic characteristics of melanomata of adults yet they very rarely metastasize.[28, 36] The blue nevus (Fig. 6) is probably not histogenically related to the other pigmented nevi but are classified with them for clinical and morphologic reasons. They are probably neurogenic in origin and hardly ever become malignant.[23, 39]

TABLE I. CLASSIFICATION OF NEVI

Histologic	Clinical
1. Junction Nevus	1. N. Spilus-macular
2. Intradermal Nevus	2. N. Verrucosus-warty
3. Compound Nevus	3. N. Pilosus-hairy
4. Juvenile Melanoma	4. N. Papillomatous-pap.
5. Blue Nevus	5. N. Lipomatodes-fatty
	6. Blue nevus

There are, then, three distinctly different lines of benign and malignant neoplasms primary in the epidermis excluding its appendages (Table II). The nonmetastasizing basal cell carcinoma (Fig. 7) stands in sharp contrast to its sister, the melanoma (Fig. 8), which is the most widely metastasizing malignancy known. The epidermoid or squamous cell carcinoma (Fig. 9) is distinctly intermediate in its malignant traits and tends to remain in lymph nodes near the primary lesion. Related to the basal cell carcinoma is the benign neoplasm called senile verruca or benign epithelioma (Fig. 10). Both the common epidermoid papilloma and the keratosis (Fig. 11) are benign neoplasms representing the epidermoid cells as a whole.

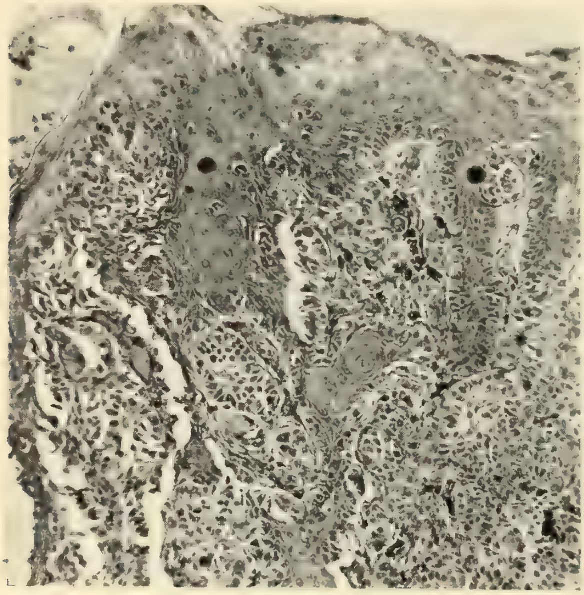

Fig. 8. Melanoma arising in a nevus. Note basal cell planeinvolvement.

Etiologic Factors

The six principal etiologic factors in the development of melanomata are: nevi, heredity, hormones, trauma, skin color and age. At least 50 to 80 per cent of melanomata[15, 26, 40] have been preceded by nevi. The great bulk of nevi are present at birth. Those appearing for the first time in adults carry a greater significance in their carcinogenic properties.[15] Both pigmented nevi and melanomata of the eye have been described as having genetic factors.[20, 30] How important heredity is in the development of either nevi or melanomata remains for future elucidation.

The effects of hormones on the development of melanomata is particularly apparent in the contrast between the rare occurrence of these malignancies in the prepubertal age group[14, 36, 40] and the more frequent and extremely malignant nature of the lesions developing in adolescence and in pregnancy.[29, 31] Cures are very rare in the latter two groups.

TABLE II. NEOPLASMS OF EPIDERMIS

Cells	Benign	Malignant
Basal Cell	Senile Verruca	Basal Cell Carcinoma
Epidermal Cells	1. Keratosis 2. Papilloma	Squamous Cell Carcinoma
Melanocytes	Pigmented Nevus	Melanoma

There is almost unanimous agreement[10, 13, 15, 25] concerning the relationship between trauma and the origin of the melanomata, yet much of the evidence is based upon unscientific data.[3, 7, 11] For instance, in one group of 162 cases[40] practically one-fourth of the melanomata were considered to have started as the result of improper medical care of what was originally supposed to have been a nevus. There is to my knowledge no histologic proof that melanomata have resulted from incomplete removal of a nevus. The original physician's inadequate therapy was not properly guided by a biopsy. However, one cannot disregard the overwhelming numbers of authors who point out the importance of such injuries as bruises, cuts from shaving, scratches, picking and other traumata to nevi and to apparently normal skin as an etiologic factor in the development of melanomata.

Melanomata appear to be relatively more frequent in blond individuals including those with sandy complexions and in skins which are sensitive to sunlight.[28, 31] The incidence of melanomata in negroes is not more than 30 per cent of that in the white race.[12, 24] A high percentage of the melanomata in the colored race appear in pale areas such as subunguinal and on palms, soles and mucous membranes.

When the figures are corrected for population distribution, one can say that melanomata become increasingly frequent with every year of life. The malignancy has occurred in all ages from birth[37] to advanced senility. By far the greatest number of cases occur between the fourth and seven decade.

Frequency

Melanomata represent from 1 to 2 per cent of all malignancies[19, 22] and constitutes approximately 20 per cent of all primary skin cancers.[30] There is an estimated occurrence of two cases per one hundred thousand population per year.[19] There is approximately the same incidence in the two sexes.[26] Pack[28] has found an average of twenty visible pigmented moles in adults and states that every member of the white race has at least one mole. On special request two local dermatologists[8] diligently studied the skins of 240 men and women in a one-day cancer detection clinic and found three individuals completely free of visible pigmented or non-pigmented nevi. Thus approximately 1 per cent of the white population may be free of nevi. This does not alter the possibility of a melanoma developing in any individual.

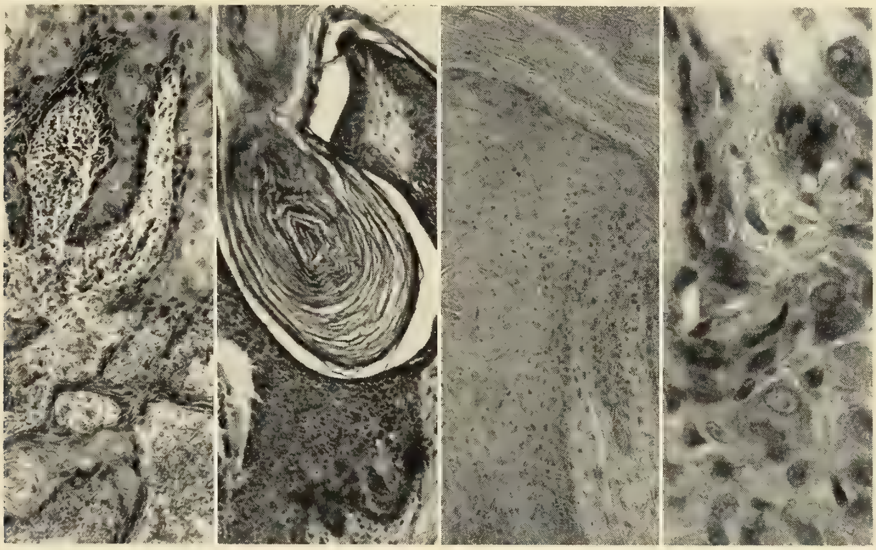

Fig. 9. (*left*) Squamous cell carcinoma.
Fig. 10. (*left center*) Benign epithelioma made up of basal cells.
Fig. 11. (*right center*) Keratosis, a precancerous lesion.
Fig. 12. (*right*) Juvenile melanoma. Three giant cells present.

TABLE III. ANATOMIC DISTRIBUTION-MELANOMA

*General Location (1,383 cases)		**Specific Sites (851 cases)	
Head and neck	28.8%	Toe Nails	2.2%
Trunk	22.2%	Finger Nails	1.2%
Upper Extrem.	14.0%	Vulva and Vagina	3.6%
Lower Extrem.	31.4%	Oro-Nasal	2.6%
No Primary	3.9%	Rectum anus	1.5%
		Male genitalia	0.4%

†Eye—Approximately 20%. Meninges—Very rare. Internal organs—Rare, if ever.
*1,4,7,11,14,15,19,40. **28. †19.

The anatomic distribution of melanomata is shown in (Table III). There is a considerably greater frequency of melanomata over nevi on the genitalia, and on the feet and hands including the nails. This is of great practical importance in prophylaxis.

Pathology

Although the bluish and bluish black, raised, smooth-surfaced lesions are the most common and easily recognized, light brown, pink or amelanotic lesions are significantly frequent and may have their origin in nonpigmented nevi. There is a wide variety of lesions which must be differentiated from both the more dangerous junction nevus and the melanoma. These include among others the list in Table IV. In the hands of expert dermatologists, there is an 87 per cent accuracy in diagnosis of pigmented nevi.[7] No physician can depend entirely upon the clinical appearance of a "mole" for the diagnosis.[2,7,28,34] The most experienced experts require routine microscopic study of every pigmented skin lesion treated. Contrary to the general opinion, biopsies probably inhibit the spread of malignant skin lesions, because the inflammatory reaction set up by the trauma occludes the lymphatics.[7,9]

TABLE IV. DIFFERENTIAL DIAGNOSIS-MELANOMA

Fibroxanthoma
Chronic Inflammation

Histologic grading of skin melanomata according to the degree of embryonic shift of the neoplastic cells is possible but not practical for prognostic or therapeutic purposes. The very earliest change from a junction nevus to a melanoma may represent a difficult histologic diagnostic problem. This is aggravated by the fact

TABLE V. PROPHYLAXIS-MELANOMA

I. Excise and Examine Microscopically the following "Nevi":
1. Feet
2. Hands
3. Subungual
4. Genitals
5. Sites irritation
6. All darkly pigmented nevi of childhood
7. With alteration in size, color, elevation, ulceration, inflammation, scaling, bleeding, crusting, tenderness, itching and increased vascularity.
8. All gray blue, blue black and black nevi
9. Nevi appearing—adult

II. Conservative Therapy of Nevi only with biopsy

TABLE VI. THERAPEUTIC PRINCIPLES-MELANOMAS

1. Wide resection.
2. Excision regional lymphnodes and dissection in continuity where practical.
3. With node metastases:
    - (a) Amputate extremity and excise proximal lymphatics if dissection in continuity is not practical.
    - (b) Alternative-quarterectomy.
4. Cosmetic and functional restoration secondary to eradication.
5. Lesions for special consideration:
    - (a) genitals (b) midline
    - (c) isolated metastases (d) eye

that already metastasized lesions may appear histologically innocuous. The great bulk of melanomata, however, are diagnosable at a glance because of the anaplastic changes present. The epidermis is always involved if the lesion is primary and is generally not invaded in skin metastases. There is a possibility that rare melanomata of the skin may exist without metastasizing for years. Prepubertal melanomata may possibly be differentiated from others by the presence of multinucleated and single nucleus giant cells[36] (Fig. 12).

The original extension of melanomata appears to be predominantly by way of the lymphatics. There is a frequent local appearance of satellite lesions which at times demonstrate a retrograde progression along lymphatics in the skin.[30] The recent brilliant successes with radical surgery only emphasizes the lymphatic type of spread of these malignancies.[28] The differentiation between chromophores or phagocytes containing melanin pigment and true melanoblasts in a regional lymphnode is a problem of the greatest importance to the pathologist and surgeon, particularly in respect to lesions on the distal parts of the extremities. Potassium permanganate solution or chlorine fumes are used to fade the melanin pigment, thus permitting greater visibility of the cellular structure and aiding in this critical differentiation.

Melanomata of the eye[12] and meninges[22,35] have been purposefully avoided in this article because they are special subjects not closely related to the skin and nevi. The rare precancerous melanosis of the conjunctiva occurring between the ages of forty and fifty years is probably a form of junction nevus. It is interesting that this lesion will clear with x-ray therapy.[33] If not so treated it generally progresses to a radioresistant, vicious melanoma within five years.

Prophylaxis

There is an almost unanimous agreement upon the importance of prophylactically excising and studying microscopically pigmented and non-pigmented nevi involving the feet, hands, subungual areas and genitals of both male and female (Table V). These nevi are practically all of the junction type and are very dangerous. Beyond this, most authors stress the importance of removing nevi from sites of irritation such as the shoulders, belt, garter, brassiere, collar and shaving areas.[1] Certainly all nevi which have alterations in size, color, elevation, ulceration, inflammation, scaling, bleeding, crusting, tenderness, itching or vascularity should be removed and studied microscopically for the presence of malignancy.[1, 7, 26, 34] Some authorities feel that all darkly pigmented nevi in childhood,[29] all gray blue, blue black and black nevi in adults and all nevi appearing during adult life should be removed.[7] One cannot afford to use conservative therapy on nevi, that is, electric desiccation, carbon dioxide snow, cautery, inadequate surgical excision, et cetera, without having taken a biopsy.

Therapy

The therapeutic principles in cases of melanomata (Table VI) take into account the extremely early metastasis to regional lymphnodes and skin, the very bad prognosis and the proved curative value of radical surgery. Only 2.5 per cent of 217 cases responded to radiation therapy.[30] The usual procedure in our experience is that the physician has removed a dark mole and sent it in for biopsy study. It proves malignant. Immediately a much wider excision of the original lesion is accomplished with a resection of the regional lymph nodes. Whether the regional lymph nodes are palpably enlarged or not does not alter the treatment.[18, 30] If the original lesion is on the trunk or on a proximal part of the extremities, a dissection in continuity including all of the skin and lymphatics in the immediate vicinity and between the lesion and the regional lymph nodes is resected.[18,27,31,32] If the regional lymph nodes contain malignant cells and the original lesion is beyond the range of possible dissection in continuity, then the limb is amputated and proximal lymphnodes are resected.[10, 11, 17, 28, 32] The alternative is a quarterectomy.[11, 28] Sufficient experience with this procedure is not yet recorded for comparative evaluation. Both physicians and patients are frequently blinded by the innocuous appearance of small skin lesions, whereas, as a matter of fact, they are as dangerous as an osteogenic sarcoma.

Lesions occurring on the genitals are of the most serious nature and require a radical vulvectomy or resection of the male genitalia with complete resection of skin and lymphatics to both inguinal areas and including lymphatics along the iliac vessels. Midline lesions frequently extend in two or more directions. They may require resection of both axillae or both inguinal areas. If near the umbilicus, resection of this structure and the round ligament is indicated. These lesions can also spread to the axillae and inguinal areas.

Prognosis

As in the case of carcinomata of the breast the usual five year survival ratings of patients with melanomata are not accurate. The number of deaths occurring during each year following the diagnosis of melanoma in a group of sixty-seven fatal cases is listed[14] in consecutive order: 19, 15, 17, 4, 2, 3, 2, 2, 2, and 1. Thus 15 per cent of the patients expired as a result of their malignancy during the second 5-year period.

Prognosis according to age reveals a slight improvement with increasing age except for the prepubertal group in which there are only rare deaths.[28] The puberty and pregnancy cases have a particularly bad prognosis.

There is a relation of prognosis to anatomical site.[14,31] This is most apparent in the slower growing subinguinal melanomata.[25,28] However, the difference in my opinion is not sufficient to alter the principles of therapy listed above. Genital lesions are particularly deadly.[28] Very early melanomata of the skin as evidenced histologically and the rare "Freckle" type[1] have a better prognosis. There is no significant variation in prognosis in the different histologic forms of skin melanomata as there is in melanoblastomas of the eye.[12]

An accurate comparative evaluation of the cure rates resulting from various methods of surgical therapy such as: local excision, local resection with dissection of regional lymphnodes, dissection in continuity, amputation, quarterectomy, et cetera, cannot be accurately compiled from the literature. The recent more radical surgery at the Memorial Hospital in New York[28] has increased the five-year survival rate for melanomata by 600 per cent. This improvement is far greater than that experienced as the result of radical surgery for almost any other common variety of malignancy.[31] A review of 595 cases from this institution[28] reveals a five-year survival of 18 per cent of patients who had no demonstrable regional metastases and a 15 per cent survival of those with regional metastases.

Conclusions

1. Histogenesis: Melanomata and nevi should be classed as epidermal neoplasms.

2. Classification: Allen's division of nevi into junction, intradermal, compound and blue nevi is favored.

3. Etiology: The principal etiologic factors in melanomata are: nevi, heredity, hormones, trauma, skin color and age.

4. Frequency: The frequency of nevi and melanomata make these diseases every physician's business.

5. Pathology: The crucial diagnostic tool, the biopsy, is manditory in the care of both nevi and melanomata.

6. Prophylaxis: The prophylactic excision of certain pigmented and nonpigmented skin lesions is important.

7. Therapy: Cosmetic and functional restoration is secondary to immediate eradication of the black cancer.

8. Prognosis: The prognosis has been greatly improved by radical therapy.

MANAGEMENT OF THE PYODERMAS

JOHN F. MADDEN, M.D.
Saint Paul, Minnesota

PYODERMAS include all cutaneous affections produced by staphylococci, streptococci, or other pus producing organisms alone or in combination. This group of eruptions is large and occupies a prominent position in dermatology.

General Considerations

Pyodermas may be superficial or deep. They may be confined to one of the appendages of the skin or may not be associated with any particular structure. In general, the lesions are due to superficial external infection and reinfection. Therefore all possible precautions must be taken to eliminate reinoculation. Cleanliness is essential in prevention and treatment. Macerating procedures are contraindicated and irritating applications should be avoided. Excessive dryness and excessive greasiness of noninfected skin favor extension of pyoderma and must be treated. Obesity, an excessively high carbohydrate diet and other improper dietary habits as well as other factors favoring pyoderma should be corrected. Many pyodermas are secondary to other dermatoses or other diseases; therefore, cure or control of the predisposing disease is part of the management of pyoderma.

Value of Antibiotics, Chemotherapy, and Other Treatment

Topical application is valuable in superficial processes where effective contact between microorganism and remedy is at its optimum. When inflammation is deep and direct contact between microorganism and remedy is at a minimum, topical application is of little or no value.

Penicillin has almost entirely replaced the sulfonamides in the treatment of pyoderma because, in general, it is more effective and less toxic. Penicillin can be administered topically as a wet pack, ointment or spray; as an inhalent; orally in liquid, capsule or tablet form; and parenterally in several different vehicles. Although the reactions to penicillin are relatively few and usually of a minor nature, they may be severe and contraindicate the further use of penicillin. Because of this fact, penicillin probably should be reserved for parenteral use where it may be a life-saving medication.

The sulfonamides, largely replaced by penicillin in treatment of pyoderma, are penicillin's foremost substitutes when systemic administration is indicated. Both penicillin and the sulfonamides are contraindicated as topical applications for the same reason; namely, a reaction from topical application for an insignificant pyoderma may cause a reaction which later will prevent their systemic use for a serious disease. Desensitization to penicillin and the sulfonamides is theoretically sound but often has been found to be impractical. There are several topical applications that are as effective as penicillin or the sulfonamides, so that it seems unnecessary to use them in this manner.

Bacitracin, in the author's experience, is the most efficient topical application in the treatment of pyoderma. The sensitizing index is also very low. It is rare to see a reaction from bacitracin. Until recently it was only used locally, so the question of systemic use was not considered.

Tyrothricin has been used as a wet dressing with indifferent results. It appeared to be a mild medication, but equal or superior results were obtained in similar cases with boric acid (diluted one dram to a quart of water) or Darier's solution (diluted one part to sixteen parts of room-temperature water).

Streptomycin and chloromycetin may have a place in the treatment of pyoderma, but the author has had little or no experience with their use.

Aureomycin has been used recently with dramatic results in cases of sycosis vulgaris which had resisted the usual forms of treatment. The drug was given orally, 250 milligrams four times a day, and used as an ointment topically. The cost of aureomycin has been so prohibitive that one hesitated to use it in superficial infections, but it may well find a major place in treatment of pyogenic infections of the skin.

Furacin has been used as a topical application and has been found to have a very high sensitization index. The author has seen more contact

---

dermatitis from furacin than any other topical application used in the treatment of pyoderma and has discontinued its use entirely.

Wet packs are probably one of the oldest agents used in the treatment of skin infections. They are of value in treatment of both superficial and deep pyoderma. The packs must be both thick and allow evaporation. A porous material such as washed surgical gauze makes an ideal pack. Packs should never be covered with oiled silk, rubber, or other impermeable substances because this prevents evaporation and promotes maceration. It is important that the pack be kept wet, but the degree of heat is unimportant; the temperature of the pack should be regulated to give the patient maximum comfort. The fluid used to make the pack should not irritate the eruption or surrounding skin.

The old topical applications such as cinnabar (red mercuric sulphide) in a shake lotion, ammoniated mercury ointment, quinolor compound ointment alone or with boric acid ointment, equal parts of diachylon ointment and boric acid ointment, and sulfur or vioform in lotions or ointments still have a prominent place in the treatment of superficial pyoderma. They should be thought of and brought to use when the newer remedies fail.

Autogenous and stock vaccines and staphylococcus toxoid have been very disappointing in this author's hands. Alterative procedures such as injections of sterile milk, autohemotherapy, et cetera, also have been of doubtful value.

Superficial roentgen ray therapy has been of considerable aid in the treatment of certain pyodermas in the past. Whether the antibiotics and new drugs will eliminate the use of roentgen rays remains to be seen. Certainly the newer drugs and antibiotics should eliminate the mutilating surgical procedures previously used in the treatment of furuncles and carbuncles.

Specific Pyodermas

Impetigo contagiosa is the most common of the superficial pyodermas and usually responds to topical applications. Bacitracin ointment is the remedy of choice. If the eruption does not show evidence of healing after twenty-four hours, one of the other remedies previously discussed should be employed. The patients are instructed to use their own towels, linen, et cetera, and to boil after use. It is advisable for the patient to sleep alone. Adhesive tape should not be used to hold bandages on the skin. This often causes maceration and spread of the eruption. The involved and surrounding parts are washed twice daily with soap and water with the hands or a soft cloth. The ointment is applied often enough to keep the lesions covered. Crusts and ointment are removed twice daily with cotton or a soft cloth. The hair is washed every other day if the eruption is on the head or neck. Cosmetics such as cream, rouge, powder, or hair oil are prohibited if the head or neck are involved. Lipstick may be used. The patients are asked to refrain from physical exercise which causes excessive perspiration. Male patients are asked not to shave when the beard is involved. Wet boric acid packs (diluted one dram of boric acid to a quart of warm or cool water) are applied to the affected parts fifteen minutes twice daily.

Impetigo of the newborn is apt to become epidemic in nurseries. Strict isolation must be observed, but even then the nursery may have to be closed and thoroughly cleansed and painted before it can be used. Sometimes epidemics are due to carriers, and it may be necessary to change nursing personnel and methods. The lesions are more often bullous and occur in moist flexures. Oil baths must be stopped and daily baths of soap and water used. A shake lotion containing cinnabar or vioform and systemic administration of penicillin is the treatment of choice. Strict cleanliness is of the greatest importance.

Furfuraceous impetigo appears as scaly, superficial patches on the face, generally seen in children in the winter months. Bacitracin or ammoniated mercury ointment usually heals the eruption, but recurrences are common until warm spring days appear.

Impetigo of Bockhart is follicular impetigo and closely related to folliculitis, sycosis vulgaris, and acne necrotica. Remedies mentioned above combined with frequent washing of the scalp often are sufficient to cure. When accompanied by pediculosis capitis and large, suppurating cervical lymph nodes, each component may have to be treated separately.

Folliculitis must be separated from similar eruptions on the scalp where it is called impetigo of Bockhart or acne necrotica and similar pyodermas of the beard called sycosis vulgaris. When the above are eliminated, folliculitis occurs as an occupational dermatitis with secondary pyoderma in "wet workers" (dish washers, bartenders, soda clerks, et cetera), tar, grease, oil, and certain chemical workers as well as secondary to vitamin A deficiency. If the causative factor is removed or treated, the folliculitis will disappear following the use of the usual local applications.

Sycosis vulgaris is a chronic inflammatory disorder involving the hair follicles of the bearded region. Aureomycin used as an ointment for topical application and 250 milligrams given orally four times a day produced miraculous results in several cases in recent weeks. The cases are too few to draw any conclusions regarding the effect of aureomycin on sycosis vulgaris in general.

Furuncles generally result from external infection and reinfection. They are often secondary to other cutaneous diseases such as scabies, pediculosis, eczema and less often to systemic diseases including diabetes, malnutrition, anemias, et cetera. The individual lesion and the skin as a whole must be treated. The skin must be properly cleansed, lubricated, and all known means used to prevent spread. The individual furuncle is immobolized, wet packs applied, antibiotics given systemically, the yellow top gently removed with a scalpel when the lesion fluctuates, and antibiotic ointment applied to the surrounding normal skin as long as drainage persists. Adhesive tape should be religiously avoided. Furuncles of the upper lip, because of venous drainage into the cerebral vessels, and carbuncles constitute a much more serious problem. Here added emphasis must be placed on all points mentioned above, especially larger doses and often multiple types of systemic medication, as well as increased attention to general nutrition, care and nursing.

Hydradenitis suppurativa is essentially a suppurative inflammation involving the sweat apparatus. The eruption is most common in the axillae and less frequent around the genitalia, perineum and gluteal cleft. The eruption often does not respond to any treatment except surgical excision of the entire involved area. Roentgen rays, systemic antibiotics, and sulfonamides have been used with indifferent results. This is one of the deep pyodermas so topical applications are of little or no value.

Ecthyma is a crusted, ulcerated deeper pyoderma which usually follows insect bites, injury, or scratching. The lesions are usually on the extremities of children. Ecthyma often responds to cleanliness and bacitracin ointment, but systemic antibiotics are occasionally necessary.

Vegetating pyoderma can be likened to ecthyma which produces a warty, elevated, exudating, crusted lesion rather than an ulcer. These lesions appear at the same sites as ecthyma for the same reason and may respond to the same treatment. The involution is often hastened by roentgen ray therapy.

Erysipelas responds dramatically to systemic antibiotics (parenteral penicillin) or the sulfonamides as compared to the older treatment of vaccine, wet packs, et cetera. Recurrent attacks generally respond to one of the above drugs.

Gangrenous ulcerating pyoderma usually accompanies chronic ulcerative colitis, but has been known to follow or occur during typhoid fever, malaria, pneumonia and other diseases. Red, inflammatory nodules of various sizes appear, fluctuate, slough, ulcerate, and spread peripherally or heal with scar formation. The lesions appear in crops with each exacerbation of the systemic disease. Treatment is supportive and unsatisfactory.

Pyogenic paronychia and pyonychia are very rare in the author's experience. Most lesions thought to be pyogenic prove to be monilial infections and do not respond favorably to treatment. A simple pyogenic infection about the nail or nails should and generally does respond favorably to local antibiotics and drainage if the pre-existing cause can be removed. This includes proper protection in the form of cotton-lined rubber gloves, hand lotions, elimination of harsh cleansers for patients who do wet work, such as housewives, bartenders, soda clerks, meat cutters, et cetera.

Granuloma pyogenicum usually is a solitary, dark red lesion which appears at the site of injury and bleeds easily when injured. Treatment is to excise a portion or the entire lesion for microscopic examination and cauterize the remainder or base with actual cautery.

Multiple abscesses of infants are comparatively rare and occur in poorly nourished infants in unhygienic surroundings. Lowered cutaneous resistance exists and the abscesses may be started by infection of the sweat glands or rubbing the skin against dirty linen, et cetera. The abscesses may be few or many and appear on all parts of the skin surface. Treatment is directed toward improving nutrition, systemic antibiotics, and strict cleanliness.

Pyodermas secondary to other diseases such as diabetes, scabies, chronic dermatitis, fistula or sinus drainage, discharging ears, sepsis and pyemia, and acne vulgaris must be treated by whatever means necessary, with the realization that the pyoderma will not heal until the primary disease has been controlled or cured.

Dermatitis exfoliativa neonatorum (Ritter's disease) is thought to be a generalized exfoliating pyoderma in infants which involutes spontaneously within a month in about 50 per cent of cases while the other 50 per cent die. Attempts have been made to differentiate Ritter's from Leiner's disease. Leiner thought that the diseases were similar, but stated that Leiner's disease is more chronic and associated with seborrheic eczema of the scalp. The treatment has been supportive and unsuccessful in half the cases.

Eczematoid pyoderma is the eczematoid process or contact dermatitis generally due to local treatment superimposed upon pyoderma. Here the eczematoid process must be treated with soothing, wet applications before attacking the pyoderma.

Chancriform pyoderma is a solitary lesion resembling a chancre accompanied by lymphadenitis of the lymph nodes draining the area. It must be differentiated from a syphilitic chancre and the primary cutaneous complex of tuberculosis. The treatment of choice is antibiotics locally and systematically. If the response is slow, superficial roentgen ray therapy may be of value.

Summary

The pyodermas and their treatments were discussed. In my experience Bacitracin ointment is the topical application and penicillin is the parenteral medication of choice in the treatment of pyodermas.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from April issue)

Mrs. J. Brorby settled in Rochester, Minnesota, in the early summer of 1876. The chief knowledge gleaned about this practitioner is contained in the following statement by the Reverend Gerk Gjertsen, Pastor of the Scandinavian Lutheran Church, in the Rochester *Record and Union* of July 7, 1876:

> Read this: Mrs. J. Brorby, midwife and physician, formerly of Madison, Wisconsin, has now located at Rochester and can be consulted in her office at her residence on Prospect Street, one door north of Dr. Galloway. Mrs. Brorby has had fifteen years of experience at one of the large hospitals of Europe and since her arrival in this country her practice has been a career of continuous success. Her charges are low. The poor are treated fair; the English, German and Norwegian languages are spoken. It has been proved that ailments of many years standing, given up as hopeless by other physicians, have been cured by her. I can cordially recommend her to everybody as a conscientious and skillful physician.

By December, 1876, Mrs. Brorby had her office over the Union Drug Store. In that month appeared a note that Mrs. Brorby, seized with a chill while preparing for church, had mistakenly poured and drunk a glass of aqua ammonia, thinking it was wine; it was stated that she took a large amount of cod-liver oil to counteract the ammonia, and that she had a narrow escape. After March 27, 1877, her card did not appear in Rochester newspapers.

Francis Walter Burns (1870-1936), a native of Carrollville, High Forest Township, Olmsted County, was born on September 13, 1870, a son of John Burns and Ellen Buckley Burns, respected citizens of the county. There were four other children: William, Ella (Mrs. John Lawler), Annette (Mrs. A. O. Tew) and Minnie. John Burns' parents came to the county in 1855; one of his brothers, Peter Burns, a substantial member of the district, in 1879 was sent as representative to the state legislature.

"Frank" W. Burns received his preliminary education in the local district schools and in the schools of Rochester. After finishing business training and working for a time as a clerk with the Winona and Southwestern Railroad at Winona, he entered the medical department of the University of Minnesota in October, 1892. Later he transferred to the College of Physicians and Surgeons, in Chicago, from which he was graduated with honor on April 24, 1896; on June 24 he was licensed by examination to practice in the state. In vacations during his final years at medical school and again before entering practice he served as an intern at St. Mary's Hospital, Rochester.

When Dr. Horace H. Witherstine, of Rochester, went to Atlanta in May, 1896, for the meeting of the American Medical Association and to be away several weeks, he invited Dr. Burns to occupy his office and look after his patients, excellent experience for the new physician, who already possessed the good will of the community. Later Dr. Burns had his office over Hargesheimer's Drugstore on Broadway; well occupied in practice, it has been noted that when the autumn elections approached and he was offered the Democratic nomination for county coroner, he refused it. In March, 1897, he moved to Stewartville to enter partnership with Dr. Edwin D. Stoddard, in practice and in the drugstore of Stoddard and Wood. Dr. Stoddard (1850-1937) was in High Forest from 1874 to 1890, in Stewartville from late 1890 into 1903. When Dr. Stoddard retired from practice and removed to California, Dr. Burns continued alone. His fellow physicians in Stewartville were Dr. Charles E. Fawcett, a graduate of 1893, and Dr. Herman R. Russell, a graduate of 1899.

On June 27, 1901, Francis W. Burns was married at Rochester to Mabel Opal, only daughter of Mr. and Mrs. A. K. Knapp, constructive pioneer settlers of High Forest Township, who later lived in Rochester. In December, 1901, Dr. and Mrs. Burns moved into the beautiful new home, "Red Gables," in Stewartville, which for eleven years was their residence and the scene of thir gracious hospitality.

Esteemed for his personal traits, which included an inimitable sense of humor, and respected and valued for his ability as a physician and surgeon, Dr. Burns had a heavy and successful practice. When he was removing with his family to California, in the autumn of 1912, the citizens of Stewartville "tendered him a banquet to express their appreciation for his work in their midst" *(Journal-Lancet,* November, 1912).

Abreast of his profession from the beginning of his career, Dr. Burns made numerous trips for postgraduate study at clinics, hospitals and medical schools, and in California as in Minnesota he was an active member of county, district, state and national medical associations. In California for nearly twenty-four years, first in Los Angeles and afterward in Pomona, he practiced medicine, paying special attention to dermatology. He died on August 28, 1936, survived by his wife and by three daughters. In 1946 Mrs. Burns was living in West Los Angeles; Janet Burns (Mrs. Edmund P.) Stone, in Pomona; Elinor Burns (Mrs. Charles) Gabriel and Jean Burns (Mrs. Stanley) Reel were in Los Angeles.

Arthur Jay Button, born in 1869, was graduated in medicine from the University of Minnesota on June 10, 1897, and on the same day received license No. 779 (R) to practice medicine in the state. He was then a resident of Minneapolis. In the following November he came to Olmsted County looking for a location, which he found in the hamlets of Genoa, New Haven Township, and nearby Douglas, in New Haven and Kalmar Townships. A few months later he removed to Hammond, Wabasha County, but maintained his professional and friendly relations in the community of his first choice and elsewhere in Olmsted County. On May 6, 1898, at a meeting of the Olmsted County Medical Society, in Rochester, Dr. Button was one of five local physicians, three in counties other than Olmsted, elected to membership. He became a member of the state medical society and of the American Medical Association.

Licensed in South Dakota in 1907, Dr. Button practiced medicine in Mobridge until about 1918. When he returned to Minnesota, he practiced (the following dates are approximate) in Hackensack from 1921 to 1925; in

Greenbush from 1927 to 1931; in Pine River between 1934 and 1938; and was in Walker as late as 1942, according to the directory of the American Medical Association.

Harry Paul Chambers (1867-1915), a native of Elm Grove, West Virginia, and a graduate of the University of Virginia and of the Baltimore College of Physicians (1891), has erroneously been considered a physician of Rochester, Minnesota, in the late nineties. Although he likely was in Rochester at some time, he never practiced there, but settled in Florence, Wisconsin, about 1900, where in excellent professional standing he practiced medicine and surgery until his death.

James (sometimes seen "John") **H. Chapman,** millwright, farmer and physician (herb doctor), came to southern Minnesota, in the neighborhood of Plainview, Wabasha County, in 1856, and ten years later to section 22 New Haven Township, Olmsted County. In 1871 he settled with his family in Rochester.

Born early in 1820 at Ontario, New York, James H. Chapman was the son of Rufus and Harriet Chapman, both of whom were natives of Ohio. First married in the East, he lived in or near Meadville, Pennsylvania, where a son, James H. Chapman, Jr., was born in 1854; two years later Mrs. Chapman died, in Wabasha County, Minnesota, leaving two children. The following year Dr. Chapman was married to Sarah E. McCullum, native of McHenry, Illinois, and daughter of Mr. and Mrs. John McCullum, who had come to Wabasha County in 1855. Of this marriage there were eight children. Sarah McCullum Chapman died in Rochester from "gastric" fever on August 26, 1889.

Herbalist though he was, without pretension to standing in the regular medical profession, Dr. Chapman had a considerable following which preferred his ministrations to those of his professional superiors. His great reliance, it is recalled by many senior residents of Rochester, was on lobelia, which earned for him the unlovely sobriquet of "the puke doctor." There were few of the older physicians of the town who did not have recollections of cases, in all of which lobelia figured, on which they had been called: sometimes when the herb doctor had failed to obtain results, and sometimes only to be dismissed in Dr. Chapman's favor. There never was question, however, of Dr. Chapman's sincerity nor of his position as a reputable member of the community.

During his years in Rochester this practitioner commonly treated patients at his home, which after 1880 was on Broadway below Elm Street, and he occasionally took a patient into the home as a lodger while treatment was being carried out. In November, 1888, the *Record and Union* stated that a blind man who had lost his sight from smallpox when he was a small child, was so improving under Dr. Chapman's care that he could distinguish light from dark, and that "in grateful appreciation of Dr. Chapman's services he voluntarily tendered him $50."

Depressed and in poor health after his wife's death, Dr. Chapman died at his home from a cardiac seizure four months later, on December 11, 1889, when he was attending a patient in the house. He was nearly seventy years of age. Of the several surviving children, record has been obtained of one: James H. Chapman, who did outstanding work in Olmsted County and the state as teacher in the public schools, county superintendent, advocate of free text books and originator of summer training schools for teachers. In 1893 he removed from

Minnesota to California; after the death of his half-brother, William H. Chapman, in Rochester in 1899, none of the family was in Olmsted County.

Charles L. Chapple (1869-1927), twenty-sixth appointee, as third assistant physician, on the staff of the Rochester State Hospital, was born in Beldenville, Wisconsin, in 1869. He received his early education at Prescott, Wisconsin, and from the University of Minnesota the degree of bachelor of arts, in 1892, and the degree of doctor of medicine in 1898; in 1898 he was licensed by examination to practice in Minnesota. After serving a year's internship at St. Barnabas Hospital, Minneapolis, and practicing medicine a few months at St. Cloud, Stearns County, it is believed, he began his work in Rochester on August 31, 1899.

On October 8, 1903, Charles L. Chapple was married at Clintonville, Wisconsin, to Grace L. Guernsey, daughter of Mr. and Mrs. George Guernsey of that place. Dr. Chapple had won an enviable place in the esteem of Rochester citizens, medical profession and laity. Mrs. Chapple, an accomplished musician, contributed much to the success of the Euterpean Society, a social group organized for the enjoyment of music, art and literature. Dr. Chapple was a Mason, his wife a Daughter of the American Revolution.

Dr. Chapple has been described by professional associates as a slight, dark-complexioned man, keen, quiet, steady and temperate, of excellent abilities and a high sense of social and moral obligation. He was an active member of the Olmsted Medical Society, its first vice president in 1903. After more than eleven years of service at the state hospital he resigned his position on April 1, 1911, and with his wife and a son Guernsey Phillips Chapple, removed to Tieton, near Yakima, Washington, with the view of becoming fruit rancher as well as physician in that newly irrigated region where there had begun an almost spectacular growth of orchards on the rich sagebrush land. At Tieton, in 1912, a second child, Helen Chapple, was born.

Licensed in Washington in 1912, Dr. Chapple at Tieton carried on the typical role of frontier physician, was member of the local school board and civic officer, and an outstanding worker for horticultural organization. For his orchards that he planted near Tieton he took first honors among some 400 members of the Yakima County Horticultural Union; and in 1919 he took second place for his orchards just west of Yakima. Subsequently he practiced medicine at Yakima, Quinault, and Pacific Beach. He was a member of county and state medical societies and of the American medical Association.

In 1942, some years retired from medical practice, he went to Lacey, near Olympia, to make his home with his son. He died in Lacey in August, 1942, and was buried in Takoma Cemetery, Yakima, beside his wife, whose death had occurred in 1927. In 1945 he was survived by his son, G. Phillips Chapple, of Olympia, instructor in machine shop, automobile and radio at the Olympia High School, and by his daughter, Helen (Mrs. B. W.) Linze, an accomplished pianist, of San Bruno, California; and by five grandchildren, Loren, Celia Ann and Ronald Chapple and Bernard and Mary Linze.

O. Chase, according to Mitchell's *History of the County of Olmsted*, of 1866, was in that year one of the two physicians (the second, Alexander Grant) in the village of High Forest, High Forest Township. Other mention of this practitioner has not been discovered.

Stillman Chase, respected "doctor," presumably a physician, fifty-four years and three months old, died in Pleasant Grove on September 4, 1860, of congestion of the lungs, after an illness of eight days. From Little Valley, New York, he had been in Pleasant Grove about a year. Funeral services were conducted at the Baptist Church.

Dr. Cheever in the summer of 1896 was constructing on the grounds of the Rochester State Hospital "a very commodious and ornamental bird cage in which all the birds of the hospital will be kept during the summer months," and he was contemplating the erection of a new band stand also on the grounds. Neither records nor memories have given a clue to the status of Dr. Cheever.

John Seymour Clark, member of the regular profession, late of New York, came to Rochester, Minnesota, as physician, surgeon and druggist in September, 1881. He had purchased the stock of drugs and medicines of Pierce Brothers and had store and office in the new building owned by Dr. Edwin C. Cross on Broadway. It seems probable that Dr. Clark was more druggist than practitioner. Evidence has not appeared that he was in Rochester after 1889.

Ida Clarke, born in Ohio in 1853, received the degree of doctor of medicine from the Woman's Medical College of Pennsylvania, in Philadelphia, in 1878. After three years of medical practice she came to Rochester, Minnesota, from Lisbon, Ohio, in September, 1881, to enter partnership with Dr. Mary Jackson Whitney, who had been in Rochester since January, 1880. The two physicians specialized in obstetrics and the diseases of women and children. After Dr. Whitney removed to Minneapolis early in 1882, Dr. Clarke practiced alone as physician and surgeon. From time to time she changed office location on Broadway, finally moving into especially equipped rooms over Damon's jewelry store.

In Rochester newspapers between 1881 and 1889 Dr. Clarke often was mentioned: when she had performed surgical operations, assisted by a local physician, or when she had acted as assistant, usually to Drs. W. W. Mayo and W. J. Mayo in performing ovariotomy or in carrying out other procedure; on one occasion she and Dr. F. L. Beecher, a dentist, helped the senior Dr. Mayo in an operation on the left upper jaw of a child at Potsdam.

Dr. Clarke possessed the esteem and confidence of profession and laity alike, and made many personal friends among the conservative residents of Rochester. After she had returned to her old home in Youngstown, Ohio, in May, 1889, to make her home with her widowed mother, she often returned on visits to Rochester and Minneapolis.

In Youngstown Dr. Clarke practiced medicine for thirty-two years. She was a member of representative medical societies, county and state, and of the American Medical Association. Her name appeared in the official medical directory of the Association for the last time in 1921.

Edward M. Clay (1866-1929), a native of Oronoco, Olmsted County, was born on March 2, 1866, a son of Mark W. Clay and Joanna Stoddard Clay.

Mark W. Clay, pioneer settler in Oronoco Township, was born at Hooksett, New Hampshire, on March 31, 1835, one of the twelve children of Walter Clay and Elizabeth Sanborn Clay, both of whom were natives of the state. In 1855 Mark Clay, in search of health, came to Winona, Minnesota, and after a few weeks to Oronoco, where for the ensuing twenty-nine years he was a leading citizen: merchant (for a time in partnership with his brother Thomas); sometime publisher of the *Oronoco Journal,* an advertising enterprise; postmaster, town officer, and representative member of the Independent Order of Odd Fellows. At the beginning of the Civil War he organized a company of soldiers, of which he was chosen captain, which served as Company K, Third Regiment of Minnesota Volunteer Infantry. He was married on March 1, 1857, to Joanna P. Stoddard, born in 1832, daughter of Thomas and Clara Stoddard of Scituate, Massachusetts; at the time of her marriage Joanna Stoddard was living at the home of her stepfather, Lewis Wilson of Oronoco Township. Mrs. Clay died at Oronoco in March, 1884, leaving seven children: Ida Augusta, Maggie W., Edward M., Harvey I., Wellington S., Zelda May and Charles F. In that year Captain Clay with the children removed to Hutchinson, McLeod County, Minnesota, where he died in 1901.

Edward M. Clay obtained his early education in the schools of Oronoco, and in the eighties engaged in various pursuits, chief of which was the editing of the *Renville Weekly* for C. M. Laramie, editor of the *Bird Island Union.* In 1889 he entered the Minneapolis College of Physicians and Surgeons, from which, president of the senior class, he was graduated in April, 1893. Renville, in Renville County, was the scene of his first medical practice. He was married in 1893 to Belle C. Benson of that place.

Although in 1895 Dr. Clay considered returning to Olmsted County, it was not until late in 1898 that he left Renville for Oronoco, where he practiced successfully and was active in professional affairs for nearly three years. Early in this period he became a member of the Olmsted County Medical Society, the Southern Minnesota Medical Association, the Minnesota State Medical Society and the American Medical Association.

In June, 1901, Dr. Clay returned to Renville, where he remained twenty-four years. During his long residence in that city, dating from 1893, as noted, he was a member of commercial clubs, alderman for several terms, a member of the local board of health, county coroner for twelve years, and surgeon for the Chicago, Milwaukee and St. Paul Railroad for twenty years. He was a charter member of the Camp Release Medical Association. Dr. Clay was a Republican and a member of fraternal organizations, among them the Masonic Lodge, Independent Order of Odd Fellows, Ancient Order of United Workmen, and Modern Woodmen of America. His recreations were hunting and fishing.

Early in 1925 Dr. Edward M. Clay removed from Renville to Hutchinson, where for two years he continued his civic and professional work. He died suddenly on November 4, 1927, when en route to Maynard to attend the funeral of Dr. Reuben Zimback; as Dr. Clay was leaving the train at Olivia to join Dr. G. H. Mesker for the remainder of the trip, he fell dead. The cause of death was believed to be cardiac disease, brought on by overwork a few weeks earlier during an epidemic of influenza. Dr. Clay was survived by his wife, a daughter, Florence, two brothers, Harvey I. Clay and Wellington S. Clay, both of Hutchinson, and one sister, Zelda M. Clay Chase, of Saratoga, California. Belle Benson Clay died in May, 1942, and was buried beside her husband at Hutchinson. In 1945 Florence Clay (Mrs. John) Davey, a registered nurse, was living in Toledo, Ohio.

Dr. Clay has been described by one who knew him well as a tall, powerfully built man, outspoken, honorable, loyal, generous to the poor, an uncompromising enemy to sham and deceit. His patients trusted him. He was an old time doctor of insight and sympathy, well grounded in fundamentals of human nature. "He did more to cure the ordinary run of human ailments than he could have done had he possessed merely technical training."

(To be continued in the June issue)

President's Letter

A CORDIAL INVITATION

Soon the ninety-seventh annual convention of the Minnesota State Medical Association will be in session. Will you be there?

If you won't, here's what you'll be missing: scientific sessions on heart surgery, joint diseases, intravenous treatment, urinary tract infections—all presented by outstanding physicians in these fields; lectures on "The Diet and Cardiovascular Disease," "The Roentgen Diagnosis of Silicosis," "The Common Hemorrhagic Diseases of Childhood," "Dystocia," and "Psychosomatic Medicine"; round table discussions on a wide range of subjects, carefully selected by the Committee on Scientific Assembly.

This year, an entire day is being devoted to the consideration of atomic energy and its effects, both beneficial and destructive. In the morning, there will be discussions of the medical applications of radioactive isotopes and, in the afternoon, the public will be invited to hear about atomic energy in war and peace, with experts speaking on the physics of atomic energy, civilian defense, and medical aspects of atomic explosion.

If you aren't there, you'll miss the special meeting of your group—specialty, fraternal or social. For, as always, there will be: Sectional programs presented by the Minnesota Chapter of the American College of Chest Physicians, the American College of Allergists, the Minnesota Academy of Ophthalmology and Otolaryngology and the Twin City Orthopedic Association; as well as a full program of luncheons and dinners arranged by the American Medical Women's Association, the Minnesota Society of Clinical Pathologists, the Minneapolis General Hospital Surgical Residents Society, the Minnesota Medical Foundation and Minnesota Medical Alumni, Nu Sigma Nu Alumni Association, the Minnesota Radiological Society, the Minnesota Chapter of the American Academy of General Practice, the Medical Veterans Society of Minnesota, the Northwestern Pediatric Society and former St. Mary's interns.

You'll miss also the annual banquet and open house, with special entertainment arranged by the St. Louis County Medical Society's Committee on Local Arrangements.

Sunday, you'll miss the golf tournament and the trap-shooting contest, with its three events. And every day of the convention there will be lake fishing expeditions.

Think over these opportunities for gaining scientific information, meeting with your colleagues, joining in the social and sports events and viewing the splendid scientific and commercial exhibits. Remember, the physicians of St. Louis County have done their utmost to make your stay pleasant, giving special attention to housing and entertainment.

Now, mark **JUNE 12, 13 and 14** on your calendar and plan to be with us in Duluth.

F. J. Elias.

President, Minnesota State Medical Association

Editorial

Carl B. Drake, M.D., *Editor;* George Earl, M.D., Henry L. Ulrich, M.D., *Associate Editors*

THE STATE MEETING

THE ninety-seventh annual meeting of the Minnesota State Medical Association will be held in Duluth, June 12, 13, 14, 1950. The early summer date of the meeting will assure plenty of accommodations for those who plan to attend. The Open House planned for Monday evening and the annual banquet to be held Tuesday evening are only part of the numerous social events planned by the Duluth members and their wives. President Laurence M. Gould of Carleton College will address the banqueters.

A glance at the program will reveal that such new developments in medicine and surgery as the diagnosis of heart lesions amenable to surgery and their surgical treatment; cortisone and ACTH in rheumatoid arthritis; newer solutions used in intravenous therapy; medical applications of radioactive isotopes; psychosomatic medicine; and atomic energy, all appear on the program. Question-and-answer periods each morning and afternoon should prove a most valuable means for stimulating interest.

The meeting this year in Duluth affords again an opportunity to combine the attendance at the meeting of you and your wife with a summer outing in the northern part of our beautiful state. This great opportunity does not come very often and advantage should be taken of this year's meeting in Duluth.

MEDICAL EDITORS' CONFERENCE

ONE of the most important innovations in the public relations activities of the Minnesota State Medical Association is the meeting of newspaper editors and physicians sponsored by the Committee on Public Health Education of our Association. The first meeting was held in Minneapolis on April 8, 1949, for the purpose of securing a better understanding between the profession and newspaper editors. The press had frequently expressed the opinion that the profession expects the press to maintain the entire burden of indirect publicity from the profession to the public. Physicians until recently have not been clear in their own minds as to what advertising, if any, on the part of the profession, as individuals or a medical society, is ethical.

At the annual meeting of the Minnesota State Medical Association held in Saint Paul in May, 1949, a resolution approved by the Council of the Association was passed by the House of Delegates clarifying the subject. This resolution stated that, with the approval of a local society, a member may ethically place a professional card stating only his name, address, telephone number and office hours and his specialty if he is so recognized in his community; likewise, a component medical society may sponsor special greetings, messages or announcements in the name of the component society or the members thereof. This action aroused considerable adverse criticism on the part of some opponents of the profession and proponents of state medicine. The newspapers were accused of selling themselves to the medical profession, and the profession was accused of unethical practice. Both accusations, of course, were absurd. As long as the local profession is agreed as to the procedure of the insertion of a newspaper advertisement containing the limited data mentioned, there is no breach of ethics any more than in the case of an insertion of such information in a classified telephone directory. Furthermore, there is nothing unethical about physicians or medical societies expressing their ideas on political or economic affairs by paid insertions in the form of advertisements, either with the names of physicians or the county medical society attached.

There are, of course, legal restrictions as to what political activities organizations like medical societies can undertake. While a physician has the privilege and, in fact, the duty as a citizen to take part in politics and may actively support a candidate, a medical society may not legally contribute to or expend funds in support of or in opposition to candidates for office or sponsor any form of advertising material for a candidate. Individuals forming political committees must, further, not make use of any official position or office which they may hold in any organization to favor candidates. When it comes to supporting a candidate for Federal office, a physician has the same rights as other citizens to contribute funds personally up to $5,000 to or on behalf of such a candidate.

The first meeting between the newspaper editors of the state and the physicians having proved such a success, a second meeting was held again this year on April 21 at the Saint Paul Hotel. It was even better attended than last year's meeting and was called primarily to consider ways and means for county societies to express themselves in local newspapers. Physicians throughout the state have felt a pressing need of expressing themselves on medical subjects, most important of which is so-called compulsory health insurance. They have felt that the local newspaper is the logical medium for such an expression on a grass roots level. The Public Health Education Committee of the State Association has come to the assistance of the county medical societies by having prepared a series of newspaper advertisements written by an advertising specialist. Copies of these insertions have been sent to the county societies and to the newspapers of the state. It was explained at the meeting that the next step is for the county medical society to arrange for the publication at its own expense of as much of this advertising material as it desires. The venture is to be financed by the members of the local societies as their special contribution to the preservation of free medical practice. Private medical practice seems well worth this small additional investment. As was brought out at the meeting, these insertions signed by the local physicians who are known to the readers will carry much more weight than the name of the society only. Doubtless, too, a few such advertisements in a large number of newspapers will be more effective than a larger number in fewer papers.

It was gratifying to witness the evidence of interest on the part of the newspaper editors of the state in conferring with the physicians. Newspaper men long have felt that the medical profession has been rather stuffy in its relations with the newspapers lest physicians lay themselves open to criticism from their confrères on the basis of unethical conduct. Physicians have long avoided interviews with newspaper reporters, even on matters that the latter have felt have legitimate news value and about which only the physician is informed. Doubtless, the newspaper editors feel that these two meetings with the profession indicate a recognition of the functions and value of the newspaper as a medium of expression on the part of the profession to the public. The acquiring of additional advertising seemed to play a secondary roll, as far as the editors were concerned.

Senator John L. McClellan of Arkansas spoke to the editors and physicians following a dinner in the evening. Though a Democrat, he sees the direction his party, with the assistance of some Republicans, is leading our country. Facing larger deficits this year than the 5.5 billion deficit of 1949 and with no hope of balancing the budget in 1951, there are those in Washington who are seriously advocating conferring dictatorial powers on the executive and plunging the country into further debt of astronomical proportions. Those who heard this real statesman, one of the few whom Washington can boast, could not fail to sense the need for all who believe in maintaining a free and solvent country to join forces.

STREPTOMYCIN IN TUBERCULOSIS

THE USE of streptomycin in tuberculosis has been given extensive trial during the past two and a half years since its tuberculostatic effect was definitely established. Of particular value in determining the status of streptomycin therapy have been the co-operative reports made by the Veterans Administration, the Army and Navy, to the Council on Pharmacy and Chemistry. The third report* largely confirms the previous two and justifies certain conclusions.

Streptomycin cannot be counted on alone to cure tuberculosis. Even in draining tuberculosis sinuses and in involvement of the genito-urinary tract, in which conditions it is specially efficacious, an appreciable number of relapses occur. In 416 patients with pulmonary tuberculosis observed two and a half years, who had received streptomycin, there was a mortality of 21 per cent. During this period, 67 per cent of some sixty-six patients with tuberculous meningitis, so treated, have died.

Streptomycin is only an adjunct in the treatment of tuberculosis. It should not be given to ambulant patients as is so often done for a few weeks trial. All the other methods of treatment, such as bed rest and surgery where indicated, should be used.

While the use of streptomycin has resulted in an increase in the percentage of cures, its use has its drawbacks. It does not have a favorable effect in the presence of much necrosis; it requires daily intramuscular injections; it produces toxic side actions such as vertigo and deafness; and it produces streptomycin-resistant bacilli.

---

*Council on Pharmacy and Chemistry: Current status of the chemotherapy of tuberculosis in man. J.A.M.A., 142:650, (March 4) 1950.

The extensive use of streptomycin, however, has established the fact that the dosage of 1 gram a day is nearly as effective as 2 grams daily and does not produce nearly as high a percentage of toxic manifestations as the larger dose; that a single intramuscular injection daily is just as efficacious as divided doses; that the development of streptomycin-resistance depends rather on the long period of treatment than on the size of the dose.

The value of the administration of streptomycin previous to and following pulmonary excisions seems definitely established, although its routine use in thoracoplasty was not thought advisable as there was only a slight reduction in the incidence of spreads in the few instances in which it was tried.

The early promise that dihydrostreptomycin might replace streptomycin has not materialized. Although less toxic, the former is less effective in 1-gram dosage (the established dose at present) and when given in 2-gram doses may produce a loss of hearing during or after administration, a condition rarely observed with streptomycin.

Another drug used rather extensively in Sweden in the treatment of tuberculosis in para-aminosalicylic acid. Its use in this country has been largely in the treatment of patients in whom the tubercle bacillus has become streptomycin-resistant. In these patients, although the comparison may not be fair, the results from the use of para-aminosalicylic acid have not warranted extensive trial. From a limited trial, there is some indication that there is less development of resistance to streptomycin and that the efficacy of streptomycin may be enhanced by the simultaneous administration of para-aminosalicylic acid orally in conjunction with streptomycin.

MATERNAL MORTALITY STUDY IN MINNESOTA

ON the recommendation of the Maternal Health Committee the Council of the Minnesota State Medical Association has approved a state-wide survey of maternal mortality in the state for the year 1950. The study will be made in co-operation with the Minnesota Department of Health. It will consist of a field investigation by a trained obstetrician as soon as a maternal death is reported and an analysis of the findings to determine the causes of death by the Maternal Health Committee.

The value of such a study was demonstrated in the previous study in 1942 as well as by studies being made in other states. Minnesota has made great progress in reducing its maternal deaths to 6/10,000 live births in 1947, the lowest in the United States. It was 7/10,000 in 1949, but there is still room for improvement as shown by the fact that Oregon reduced its rate to a new national low of 4/10,000 in 1948.

The Council urges that all physicians and hospitals co-operate in this study. All maternal deaths should be promptly reported by mail or telephone, collect (GLadstone 5973, Minneapolis), to the Division of Maternal and Child Health of the State Health Department in addition to the usual report of the death certificate to the Division of Vital Statistics. This will assist the committee in making a prompt investigation. The committee urges that an autopsy be obtained in each maternal death.

SURVEY OF PHYSICIANS' INCOMES

The AMA Bureau of Medical Economic Research is co-operating with the Office of Business Economics of the U. S. Department of Commerce in sending out questionnaires regarding professional incomes to over 100,000 members of the profession. The purpose of the inquiry is to obtain accurate estimates of the income of the profession for determining the cost of medical care to the American people.

The survey will cover 62.5 per cent of the 200,000 physicians whose names are contained in punch card files of the AMA. A short form requesting income data for 1949 will be sent to every other of the 200,000 names. Of the remaining 100,000 names, every fourth will be selected; 10,000 short forms and 15,000 long forms will be sent to these individuals.

Physicians need have no concern lest the replies may be used by the Bureau of Internal Revenue. The Bureau has no access to income reports, and for this reason the present survey is being made. Your co-operation in returning the forms promptly and accurately filled out is earnestly requested. Results will be published by the Department of Commerce next fall in its monthly publication, *Survey of Current Business.*

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

THE WELFARE STATE—WHAT IS IT?

Many Americans have spoken up against the socialistic trend in government today. Representatives of these views from all phases of American life include an industrialist, an editor, a professor, an educator and politician, and a reporter. From their words come greatly-needed definitions and explanations of traditional American philosophies—very welcome when such terms have been so mistreated and misunderstood of late.

Industry Editor Calls a Spade a Spade

Making the most of frequently-used and misused words in the daily news, Art Hood, editor of the American Lumberman and Building Products *Merchandiser,* declares in a recent issue of *Systems Magazine,* that the inner battle of Semantics in the cold war has allowed socialists and communists to twist the meanings of revered American words and fit them into slogans.

Defining the welfare state, he says:

"Within the cold war is an inner battle of Semantics. *Democracy, Freedom* and *Liberty* have been appropriated as slogans by socialists and communists.

"And now they've done it again! We have been trapped into calling a leftish government a 'Welfare State.'

"Every time the Politburo hears where one of us has damned the Welfare State they must get a belly laugh.

"It would be laughable if it were not so tragic.

"Socialism is not a 'Welfare State.' . . .

"And communism is not a 'Welfare State.' . . .

"Russia is a *slave* state. Let's call it that!

"England is a *regimented* state. Let's call it that!

"The only true *welfare state* is one with our kind of a Constitution and Bill of Rights and with a private enterprise economy.

"Let's be realists. *We can't win elections and block socialism by condemning welfare and security.*

"We *can* elect Representatives and Senators who will block further socialization of our political economy, IF every one of us will hammer home these truths:

"1. That welfare and security are nothing but words in Russia and England—while they are *facts* in America.

"2. That the boasted equality of the socialists and communists is one of common destitution.

"3. That slavery to the state is the inevitable result of socialism and communism.

"4. That welfare and security by any government is money taken from the people and given back, less a 40 to 60 per cent service fee.

"5. That those who want welfare and security in America can provide it cheaper themselves than by paying taxes to provide it.

"6. That the Constitution of the United States and our Bill of Rights provide the highest degree of welfare and security ever known in the history of man."

Statism More Than a Scare Word

Dorothy Thompson has a respect for correctly used words, also. She has shown understandable concern over President Truman's recent statement that statism is merely a scare word. Quoted in the Kansas City *Times,* she gives her views on the welfare state and statism:

"President Truman professes not to know the meaning of 'statism,' by which Senator John Foster Dulles recently defined the tendencies of the Truman administration. The President said he had looked the word up in two or three dictionaries and that they were in disagreement. 'It's simply a scare word,' Mr. Truman concluded.

"There are many words in common use and of generally accepted meaning, which have not found their way into dictionaries. . . . The dictionary is maintaining a decorous civilization which has not caught up with what Winston Churchill described as 'this grim, ferocious epoch.' Its definition of 'atomization' is 'to reduce to atoms, pulverize, spray.' Future editions will have to add 'vaporization of inorganic and organic matter, including human beings, by atom bombs.' . . .

Rubber-Stamp Citizens

"But the President knew perfectly well what he (Senator Dulles) meant, and so do we all, without reference to any dictionary. The Senator meant by 'statism' the tendency of the state to encroach into all the fields hitherto reserved to the individual and society; to absorb more and more of the citizen's earnings; exercise increasing control over his life and habits; and reduce him to becoming a rubber stamp of the state-bureaucratic apparatus."

Miss Thompson expands her definition of statism to include the meaning given by Mussolini:

> "Everything in the state; nothing outside the state."
>
> "Thus," she declared, "statism is total state power, which can be achieved gradually, as well as by revolution. Its chief psychological weapon is to identify the state with the people, as though they were the same, which, of course, they are not."

Continuing, Miss Thompson avers:

> "When society gives powers to the state it is weakened in the same proportion. And that the state is becoming everywhere stronger and the people weaker is visible to the naked eye, even if not visible in the dictionary."

The debate about which is best, power in the state or in the people, concerned the writers of the Constitution and the founders of the first United States government. Miss Thompson, in her forthright manner, makes this point in conclusion:

> "In terms of their own era, Hamilton was a statist, and Jefferson an anti-statist. It is certain, I think, that if those two great minds were meditating the same question today, in a highly organized industrial society, which at that time did not exist, they would have other policies.
>
> "But they would not avoid the issue by a wise crack, and, neither should the President.
>
> "For one way by which the state shows contempt for the people, is to reduce all issues to slogans and wisecracks."

Stassen Scores Again in Discussion on Socialism

Speaking on the Town Meeting of the Air recently, Harold Stassen made a strong case against the trends of socialistic government. Discussing with Professor Arthur M. Schlesinger of Harvard, the question: "How Will the British Elections Affect the United States?", Stassen pointedly remarked:

> "I've heard many interpretations of the results, but this is the first time I've heard it interpreted as a 'stunning victory' (quoting Professor Schlesinger) for the socialist state. I think it was a stunning victory in which the victors were stunned. In fact, the *London Times* . . . said that any last-ditch attempt to interpret the meager Labor new majority as a mandate to go on as before would be foolish and futile. . . ."

A Distinction Is Necessary

Mr. Schlesinger then posed this question to Stassen:

> "I do believe that it's essential for us to have in our own minds the distinction between the welfare state and socialism. I would ask the Governor, who said in his speech that the compulsory health program and the Brannan Plan are both copies from the British Labor program . . . if there is so little difference between the Fair Deal program and the program on which the Tories achieved their gains in this last election, what does he conclude from that as to the future of the welfare state?"

Out of Professor Schlesinger's rather drawn-out and confused question, Mr. Stassen scores his most important point of the evening:

> "Well, that's a very common misinterpretation of the Conservative position. It's not true that they said, 'Me, too.' I quote specifically from their (the conservatives') platform, *Right Road for Britain:* 'We shall bring nationalization to a full stop here and now. Therefore, we shall save all those industries such as cement, sugar, meat distribution, chemicals, water, and insurance which are now under threat by the Socialists. We shall repeal the Iron and Steel Act, before it can come into force. The nationalization of tramways will be halted. Wherever possible, those already nationalized will be offered to their former owners, whether private or municipal. We shall also be prepared to sell back to free enterprise those sections of the road haulage industry which have been nationalized.'
>
> "In other words, clearly the Conservative position was against socialism.
>
> "Now the effort of the Socialists is constantly to interpret an opposition to socialism as being a position against social insurance, which is an entirely different thing.
>
> "The whole development of unemployment compensation, of old-age assistance, has been advanced by both parties in England, as it has been advanced by both parties in the United States.
>
> "What we are against—what the Conservative in England is against—is taking over, in a great centralized government, the actual operation, ownership, management of the great industries of a country, because that's the way to lower the standard and defeat the welfare of the people."

Confusion in Terms Is Answered

During the question and answer period, a man asked Stassen this question:

> "Professor Schlesinger seems to confuse support of human welfare with support of a welfare state. I wonder if the Governor would care to comment."

Stassen realized the man's understanding of word-meaning and his concern for clarity, and went on to expand the statement:

> "I think that your question is well put, in that all parties in both countries want to advance the welfare of the people. The question is how is it done? The people

of England are finding that their welfare is not improved, and they are suffering from a lower standard of living than are the peoples on the Continent who've turned away from socialism.

"The whole basic question is why do we have the best standard of living in the world in America? It's because of our tradition of individual freedom—freedom economic, social, political, and religious. We say let's carefully advance the welfare of the people while holding fast to those individual freedoms."

BRITAIN HAS NEW PROBLEM PLUS MORE EXPENSE

Britain's latest problem, ironic as it seems, is one of large stocks of food—enough, in fact, to permit increases in the people's rations. But, says a *New York Times* dispatch quoted in the *Wall Street Journal,* "this pleasant development puts the government in a 'peculiar situation'."

In Britain, all foods are supported by heavy government subsidies. This makes it quite necessary for Sir Stafford Cripps, the budget manager, to consider seriously if the government can afford to let the nation eat more. He says the treasury can't permit that.

The *Wall Street Journal* suggests this alternative:

> "The government could just put the extra food in the open market and let folks decide for themselves whether they wanted to pay more to eat more. That's a course the government is 'very reluctant to take'; things like that must be planned, not left to the people."

The editorial goes on to explain that the subsidy program was begun in the first place to help the people get food during a period of shortages. Going on, it comments:

> "Now the shortages of most foods are ended. Yet the government cannot let the people have a better diet because of that self-same rationing and subsidy program.
>
> "So because the government is so solicitous of the people's welfare the people can't have any more to eat.
>
> "Have you ever noticed how planners do wonderfully well at planning austerity and find nothing so disconcerting as the least hint of abundance?"

It May Be Strategy

Of course, this depriving the British people of what they actually take part in producing, whether directly or indirectly through food production or buying foods, may prove to be clever socialist strategy. This is explained by Stephen C. Noland, of the *Indianapolis News,* writing from England before the election:

> "A good example of the strategy of the British Labor party leaders in promoting their Socialistic program is the use of the food rationing system to win support for the steel nationalization project. . . . The steel worker and his wife . . . are getting a poor food break compared with the miner and his wife. . . . This is the grievance that the Labor party politicians wanted. It is in line with their policy of consistently creating small grievances and then offering Socialism as the way to correct the evil which angers the people."

Healing, Also, Too Expensive?

The *London Daily Mail* furnishes a quote from a doctor which brings home all too clearly the inherent dangers in a socialist control-minded health system. It speaks for itself:

> "Lord Horder, one of the King's doctors, accused the labor government today of putting undue controls on the medical profession. Great Britain's socialized medicine program, he said, recently posted a notice in one hospital reading, 'Operating theatre will not be used except between the hours of 9:00 a.m. and 5:30 p.m.' Another example of government control, he said, was an order to hospitals saying, 'Use of penicillin in this hospital must be cut down. It is too expensive.' "

Prison Is Paralleled with Domestic Security

If government security is carried to its utmost point, things may get to the stage where everyone in this country is guaranteed his food, housing, clothing and, subservience. Such security is so like that found in a prison, that it has caused Harvey S. Firestone, Jr., quoted in the Harding College *Letter,* to remark:

> "Nobody in this world is more secure than a man in a penitentiary. He is fed, clothed and housed. But he is not free to go and come as he pleases. He is watched, guarded and disciplined. There are millions of people in other lands who have that same kind of security. But we Americans have always believed that the only real security lies in liberty and opportunity."

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

230 Lowry Medical Arts Building
Saint Paul, Minnesota

Julian F. DuBois, M.D., Secretary

MINNEAPOLIS MAN FINED $1,000 FOR VIOLATION OF FEDERAL FOOD, DRUG AND COSMETIC ACT

Re. United States of America vs. Lafayette M. Gray, an individual trading as L. M. Gray and Powdr-X-Company.

On March 22, 1950, L. M. Gray, seventy-three years of age, 5025 Queen Avenue South, Minneapolis, was sentenced by the Hon. Gunnar H. Nordbye, Judge of the United States District Court, to pay a fine of $1,000 following Gray's entering a plea of nolo contendere to two counts in an information charging Gray with violating the Federal Food, Drug and Cosmetic Act. Gray paid the fine.

Gray had been convicted by a jury in the same Court on March 27, 1948, of introducing in interstate commerce at Minneapolis, a number of packages containing a drug called Powder-X, the Government charging that a letter accompanied the shipment, which letter contained the following statement: "In fact it is an ointment that is splendid for almost any infection, abrasions, or ulcers." It was further alleged that the drug was misbranded in that the above statement was false and misleading because the drug is not efficacious in cure, mitigation and treatment of infections, abrasions or ulcers. Following his conviction in 1948, Gray appealed to the United States Circuit Court of Appeals, which Court reversed the conviction because of errors in the form of verdict used and remanded the case for a new trial.

The investigation was conducted by representatives of the Food, Drug and Cosmetics Division of the Federal Security Agency at Washington and Minneapolis. The trial was conducted by Clifford F. Hansen, Assistant United States Attorney of Saint Paul. Mr. Hansen was assisted by legal counsel representing the Department of Justice and the Federal Security Agency.

MINNEAPOLIS WOMAN ORDERED TO SERVE ONE YEAR FOR MANSLAUGHTER FOLLOWING CRIMINAL ABORTION

Re. State of Minnesota vs. Rose Vivian Baldwin

On April 21, 1950, Rose Vivian Baldwin, thirty-five years of age, 825 Chicago Avenue, Minneapolis, was sentenced by the Hon. Harold N. Rogers, Judge of the District Court to a term of not less than five, nor more than twenty years in the Women's Reformatory at Shakopee, Minnesota. Mrs. Baldwin had entered a plea of guilty on March 24, 1950, to an information charging her with the crime of manslaughter in the first degree, following a criminal abortion. Judge Rogers, after hearing from legal counsel for the defendant and the Minnesota State Board of Medical Examiners, stayed the sentence for five years but ordered the defendant to serve one year in the Minneapolis Women's Detention Home.

Mrs. Baldwin was arrested on March 2, 1950, when it was first learned that the patient, a twenty-four-year-old niece of the defendant, was in critical condition at Minneapolis General Hospital. The investigation by the Minneapolis Police Department and a representative of the Minnesota State Board of Medical Examiners, disclosed that an abortion had been performed upon the patient on January 30, 1950, by the defendant by means of a catheter, for which the defendant was paid $20.00. The patient was hospitalized on February 5, 1950, but the matter was not called to the attention of the Minneapolis Police Department until March 2. At that time it was too late to take a dying statement from the patient because of the patient's condition. The patient died on March 7, 1950. Sufficient evidence was obtained to warrant the issuance of a criminal complaint and the subsequent prosecution of the defendant.

In sentencing the defendant, who has no medical training of any kind, Judge Rogers told her that she was responsible for the death of her niece and that it would be a serious mistake for the defendant to go entirely free of any punishment. A plea for leniency was made for the defendant on the grounds that she had never performed any other abortions except on herself. However, the defendant admitted that she had previously been investigated by the Minneapolis Police Department in 1949, for accepting $100 to perform an abortion. That abortion was not performed, and the $100 was returned to the patient.

SYPHILITIC CARDIAC DEATHS

(Continued from Page 440)

in which death was due to the narrowing of the coronary orifices, except where there was an associated valvular deformity, showed a minimal amount of hypertrophy. This fact does not support the theory that coronary insufficiency, in general, is a causal factor in cardiac hypertrophy. Spirochetes were not found.

The findings in the coronary arteries not including the orifices do not show stigmata of syphilis. There is nothing in this analysis to suggest that syphilis is a factor in the etiology of coronary sclerosis. The sclerosis in the arteries does not appear to be increased in cases of syphilitic heart disease.

Some useful clinical applications may be drawn from the analysis of these 422 cases of syphilitic hearts. The hearts in cases of aortic insufficiency have the greatest degree of hypertrophy. Infarction with a resulting friction rub is rare in syphilitic hearts. The aortic valve is the only valve involved. The valvular deformity causes insufficiency but never stenosis. An anatomic basis for angina and sudden death due to a narrowing of the coronary orifices is a common finding especially in Type 2 where death resulted from coronary insufficiency. It is necessary to differentiate syphilitic heart disease from coronary sclerosis and rheumatic aortic stenosis. Pericarditis either from infection or as a result of myocardial infarction is so rare that it hardly needs to be considered in a diagnosis of syphilitic heart disease.

MINNESOTA STATE MEDICAL ASSOCIATION

Ninety-Seventh Annual Meeting

Duluth Armory, Duluth, Minnesota

June 12, 13, 14, 1950

ANNOUNCEMENTS

Presiding officers at each session have been instructed by the Committee on Scientific Assembly to show a blue light on the speakers' rostrum two minutes before the end of each speaker's program time. A red light will show when his time is up.

Register and Secure Your Badge at the Registration desk at the Duluth Armory at 8:00 A.M. Admittance will be by badge only. Arrangements have been made with the hospitals to admit interns and key hospital personnel as guests *if previously certified.* Out-of-state physicians can secure guest badges by presenting their membership cards from their local county and state medical societies.

Telephone Service: All physicians attending the Annual Meeting are reminded to tell their home and office secretary how they can be reached during their attendance in Duluth. Special incoming lines have been installed at the Armory Registration desk. All local and long distance calls will be handled promptly if they are directed to the Minnesota State Medical Association at the Duluth Armory, *Hemlock 8733.*

Bring Your Membership Card: There will be no registration fee for those who present a membership card or receipt or other evidence from their county society or the state association or the American Medical Association, nor for members of associated professions including dentists, pharmacists, interns, nurses, hospital personnel, teachers or social welfare workers who present invitations or other identification.

Badges: You are requested to wear your badge while you are on the convention floor. This is important and will greatly assist us to eliminate undesirable persons such as cranks and pickpockets who so frequently try to take advantage of meetings of this character.

Parking: Good parking space is available next to the Armory.

Visit the Exhibits: In keeping with established custom, forty-five minute recess periods have been provided each day, during which time those attending the Annual Meeting are urged to visit the scientific and technical exhibits. The large exhibit of technical displays is interesting and educational. Stop and show your appreciation of the exhibitors' support in helping to make the 1950 MSMA Convention successful.

Round Table Luncheons: A series of twenty-one Round Table Discussion Luncheons have been arranged for this meeting. One luncheon is scheduled for Monday; ten will be held on Tuesday and ten on Wednesday. Tickets may be purchased in advance for these luncheons, all of which are held at 12:15 P.M. at either the Hotel Duluth or Hotel Spalding. Attendance at each luncheon is limited; late-comers are accommodated according to their choice if limits have not already been reached. Tickets $1.75, tips included.

Medal: The Southern Minnesota Medical Association will again award a medal to the individual physician presenting the outstanding scientific exhibit. The award will be made at the banquet Tuesday evening, June 13, at Hotel Duluth.

Fifty Club: Members who this year will have completed fifty years of practice in Minnesota will be honored by election to Minnesota's "Fifty Club." Candidates will be honor guests at the Ninety-seventh Annual Banquet, 7:00 P.M., Tuesday, June 13, Hotel Duluth, and will be presented with lapel buttons and certificates at that time.

Meeting Places: The general sessions Monday, Tuesday and Wednesday will be held in the Duluth room, on the second floor of the Armory. The sectional meetings will be held in the St. Louis room, located in the northeast corner of the exhibition floor, except the Minnesota Academy of Ophthalmology and Otolaryngology, which will meet in the St. Mary's Hospital Staff Room, and the Minnesota Society of Clinical Pathologists, at St. Luke's Hospital.

Public Meeting: The Wednesday meeting this year will be devoted to a consideration of atomic energy, from medical and defense standpoints. The public is invited to attend the afternoon meeting, beginning at 2 p.m. Outstanding speakers—medical and military—will discuss "Atomic Energy in War and Peace."

Woman's Auxiliary: Physicians' wives attending the meeting may secure programs for the business and social sessions of the Woman's Auxiliary at the Women's Registration Desk on the mezzanine of the Hotel Duluth. All physicians' wives attending the meeting are cordially invited to attend the special events arranged by the hostesses of the St. Louis County Medical Auxiliary.

Obstetric Manikin Demonstrations: A discussion of delivery problems and techniques, with the use of the manikin, has been arranged through the courtesy of the Minnesota Department of Health. These discussions will be held at special luncheons on each of the three days of the Annual Meeting and at 5:15 in the Armory, Monday and Tuesday.

GUEST SPEAKERS

We are indebted to the following societies and organizations for guest speakers at this meeting:

The Minnesota Department of Health—Obstetric Manikin Demonstrators: Rodney F. Sturley, St. Paul, Clinical Instructor in Obstetrics and Gynecology, University of Minnesota; Ralph A. Reis, Associate Professor of Obstetrics and Gynecology, Northwestern University, Evanston, Illinois; Robert E. McDonald, Assistant Clinical Professor of Obstetrics and Gynecology, Marquette University, Milwaukee, Wisconsin; Speaker, Stewart Wolf, Associate Professor of Medicine, Cornell University Medical College, New York, New York.

The Minnesota Radiological Society—Speaker, Eugene Pendergrass, Professor of Radiology, University of Pennsylvania, Philadelphia, who will deliver the annual Russell D. Carman Memorial Lecture in Radiology.

The Minnesota Society of Clinical Pathologists—Speaker, Ancel Keys, Ph.D., Director of Physiological Hygiene of the University of Minnesota, Minneapolis, who will deliver the annual Arthur H. Sanford Lectureship in Pathology.

Northwestern Pediatric Society—Speaker, Armand J. Quick, Marquette University, School of Medicine, Milwaukee, Wisconsin.

Northern Minnesota Medical Association—Speaker, Robert Elman, Washington University Medical School, St. Louis, Missouri.

Other visiting speakers at this meeting:

C. Rollins Hanlon, Assistant Professor of Surgery, The Johns Hopkins Hospital, Baltimore, Maryland.

Howard A. Carter, Ph.D., Secretary, Council on Physical Medicine and Rehabilitation, AMA.

Colonel Elbert DeCoursey, Office of the Surgeon General, Washington, D. C.

Stephan Epstein, Marshfield Clinic, Marshfield, Wisconsin.

ROUND TABLES

Duluth and Spalding Hotels

12:15 P.M. Daily

Monday, June 12

OBSTETRIC MANIKIN DEMONSTRATION—Robert E. McDonald, Milwaukee, Wisconsin

Tuesday, June 13

MASSIVE UPPER GASTROINTESTINAL HEMORRHAGE—Robert Elman, St. Louis, Missouri

NEWER DRUGS AND THEIR USE—W. W. Spink, University of Minnesota

ANESTHESIA—K. E. Latterell, Duluth

DIARRHEA AND CONSTIPATION—William G. Sauer, Rochester

WHAT CAN THE GENERAL PRACTITIONER DO FOR THE NERVOUS CASE?—L. R. Gowan, Duluth

SURGICAL TREATMENT OF THE INJURED HAND—Tracy E. Barber, Austin

RECENT ADVANCES IN CLINICAL OBSTETRICS AND GYNECOLOGY—W. F. Mercil, Crookston

ALLERGY AND THE ANTIHISTAMINIC DRUGS—R. N. Bieter, University of Minnesota

THE PART OF THE GENERAL PRACTITIONER IN THE MANAGEMENT OF VESICAL NECK OBSTRUCTION—Frederic E. B. Foley, St. Paul

OBSTETRIC MANIKIN DEMONSTRATION—Ralph A. Reis, Evanston, Illinois

Wednesday, June 14

DIABETES—NEW INSULINS AND OTHER TREATMENT—S. H. Boyer, Jr., Duluth

CARDIAC EMERGENCIES—R. O. Sather, Crookston

THE CROSSEYED CHILD—Malcolm C. Pfunder, Minneapolis

DISABILITY EVALUATION—C. C. Chatterton, St. Paul

FARM INJURIES—H. H. Young, Rochester

MENSTRUAL IRREGULARITIES—B. F. P. Williams, Duluth

SURGICAL MANAGEMENT OF VARICOSE VEINS—W. J. Deweese, Bemidji

POSTOPERATIVE WOUND COMPLICATIONS—J. S. Spang, Duluth

MODERN CONCEPTS IN THE MANAGEMENT OF ACNE—Frederic T. Becker, Duluth

OBSTETRIC MANIKIN DEMONSTRATION—Rodney F. Sturley, St. Paul

SOCIAL EVENTS

Monday, June 12

Luncheons

AMERICAN MEDICAL WOMEN'S ASSOCIATION, INC.

12:15 p.m., Duluth Athletic Club, 402 West First Street. Dr. Selma Mueller, Duluth, will speak on her medical experiences in the Orient.
Make reservations with Dr. Mueller, 916 Medical Arts Building, Duluth. (Open to all visiting women physicians.)

MINNESOTA SOCIETY OF CLINICAL PATHOLOGISTS

Guests of hospital at 12:15 luncheon, following Sanford lectureship.

MINNESOTA CHAPTER OF THE AMERICAN COLLEGE OF CHEST PHYSICIANS

12:15 p.m., Ballroom Floor, Hotel Duluth.

Dinners

MINNEAPOLIS GENERAL HOSPITAL SURGICAL RESIDENTS SOCIETY

6:00 p.m., Duluth Athletic Club

MINNESOTA MEDICAL FOUNDATION AND MINNESOTA MEDICAL ALUMNI

6:00 p.m., Hotel Spalding
Program will include greetings from alumni and members of the Foundation; address by Donald J. Cowling, Ph.D., St. Paul, President Emeritus of Carleton College.
Make reservations with Dr. George N. Aagaard, 3411 Powell Hall, University of Minnesota, Minneapolis

NU SIGMA NU ALUMNI ASSOCIATION

6:00 p.m., Athletic Club

MINNESOTA RADIOLOGICAL SOCIETY

6:30 p.m., Northland Country Club.
Make reservations with Dr. A. L. Abraham, St. Luke's Hospital, Duluth

MINNESOTA CHAPTER OF THE AMERICAN ACADEMY OF GENERAL PRACTICE
6:00 p.m., Tally-Ho Room, Hotel Holland
Speaker will be Dr. E. C. Texter, Detroit, Michigan, Past President of the American Academy of General Practice.

MINNESOTA SOCIETY OF CLINICAL PATHOLOGISTS
6:00 p.m., St. Mary's Hospital

Tuesday, June 13

Breakfasts

FORMER ST. MARY'S INTERNS
8:00 a.m., St. Mary's Hospital

Luncheons

MEDICAL VETERANS SOCIETY OF MINNESOTA
12:15 p.m., Main Dining Room, Hotel Holland
Make reservations with Dr. E. Irvine Parson, 815 Fidelity Building, Duluth

NORTHWESTERN PEDIATRIC SOCIETY
12:15 p.m., Kitchi Gammi Club

Dinner

ANNUAL BANQUET—MINNESOTA STATE MEDICAL ASSOCIATION
7:00 p.m., Ballroom, Hotel Duluth

SPORT EVENTS

Golf Tournament: The annual Golf Tournament of the Minnesota State Medical Association will be held Sunday, June 11, at the Northland Country Club, with the tee-off at 1 p.m. All medical golfers are invited to enter and compete for the attractive prizes that have been donated. Make reservations on the enclosed card immediately. Robert H. LaBree, Duluth, is tournament chairman.

Lake Fishing: Daily expeditions along the North Shore of beautiful Lake Superior. Three-hour trips for groups from four to 12 persons. All fishing gear will be furnished with the boats, but an extra jacket is recommended. Price will be $1.50 to $3 per person, depending upon the size of the party. Make reservations in advance with Karl E. Johnson, 2031 West Superior Street, Duluth.

Trap Shooting: Three events will be held Sunday, June 11, from 12 noon till 6 p.m., at the Duluth-Mesabi Employes' Gun Club, Proctor:

Event I—"Fifty-Bird Event Skeet Shoot"—for Malcolm Pfunder Trophy, donated by Dr. Malcolm Pfunder of Minneapolis.

Event II—Duck Hunters' Special "Razzle-Dazzle 25-Bird Event"—for Leech Lake Trophy, donated by Dr. Vernon D. E. Smith of St. Paul.

Event III—"Twenty-five Bird Trap Shoot" Lewis classification if sufficient shooters in attendance. Prizes will be awarded.

Ammunition and windbirds will be available. A. C. Kelly, 825 Medical Arts Building, Duluth, is chairman of these events.

Scientific Program

Monday, June 12, 1950

SECTION I—GENERAL SESSION

A.M. *Morning*

8:30 Visit Scientific and Technical Exhibits........Armory

9:00 ADVANCES AND INVESTIGATION IN SURGERY OF THE HEART........Armory
Diagnosis—Paul F. Dwan, University of Minnesota
Radiology—Joseph Jorgens, University of Minnesota
Catheterization—Forrest H. Adams, Minneapolis
Surgical Treatment—C. Rollins Hanlon, Assistant Professor of Surgery, The Johns Hopkins Hospital, Baltimore, Maryland

10:00 Question and Answer Period

10:15 *Intermission*

Visit Scientific and Technical Exhibits........Armory

11:00 ARTHUR H. SANFORD LECTURESHIP IN PATHOLOGY........Armory
The Diet and Cardio-vascular Disease—Ancel Keys, Ph.D., Director of Physiological Hygiene of the University of Minnesota, Minneapolis
Presentation of Speaker—A. H. Wells, Duluth, President, Minnesota Society of Clinical Pathologists

P.M. *Afternoon*

12:15 OBSTETRIC MANIKIN DEMONSTRATION........Hotel Spalding
Robert E. McDonald, Assistant Clinical Professor of Obstetrics and Gynecology, Marquette University, Milwaukee, Wisconsin

1:30 Visit Scientific and Technical Exhibits........Armory

2:00 NEW ADVANCES IN TREATMENT OF JOINT DISEASES........Armory
Available Treatments in Arthritis—C. W. Fogarty, Jr., Saint Paul
Investigative Study in Arthritis—C. H. Slocumb, Rochester
MOVIE—"Effect of Cortisone and ACTH in Rheumatoid Arthritis"

3:05 Question and Answer Period

3:15 *Intermission*

Visit Scientific and Technical Exhibits........Armory

4:00 RUSSELL D. CARMAN MEMORIAL LECTURE........Armory
The Roentgen Diagnosis of Silicosis—Eugene Pendergrass, Professor of Radiology, University of Pennsylvania
Presentation of Speaker—J. P. Medelman, M. D., Saint Paul, President, Minnesota Radiological Society

5:00 Visit Scientific and Technical Exhibits........Armory

5:15 OBSTETRIC MANIKIN DEMONSTRATION........Armory
Ralph A. Reis, Associate Professor of Obstetrics and Gynecology, Northwestern University, Evanston, Illinois

Evening

8:00 OPEN HOUSE........Ballroom, Hotel Duluth
Duluth Physicians' Little Symphony Orchestra
Specialty musical numbers by members of orchestra

Minnesota Academy of Medicine

Meeting of January 11, 1950

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, January 11, 1950. Dinner was served at 7 o'clock, and the meeting was called to order at 8:10 p.m. by Dr. E. M. Hammes, Chairman of the Executive Committee.

There were fifty members and two guests present.

Dr. Hammes then showed cartoon drawings of the living past presidents and read a short poem appropriate to each one, after which each living past president was presented with his cartoon drawing.

The incoming President, Dr. William Hanson, of Minneapolis, was then introduced.

Dr. Hammes called on Dr. John A. Lepak for his address as retiring President, "Challenging Problems and Demands of the Aged and Chronically Ill." (See page 450, this issue.)

Discussion

Dr. F. F. Callahan, Saint Paul: I wish to congratulate Dr. Lepak on his excellent survey of one of our most pressing problems. In 1945, when the State of Minnesota started its present plan of care of the indigent, the cost was approximately $481,000. In 1949, the cost was $4,000,000, and unless some change is made, it will be around $5,000,000 for the year 1950. The greatest part of this money is spent on care for the aged. Even with the expenditure of these large sums of money, many of the aged are still improperly cared for. Dr. Lepak mentioned the falling death rate from tuberculosis. Before the 1949 Minnesota Legislature met, it had been legally impossible to use any of our tuberculosis sanatoria for any other purpose than the care of the tuberculous. The 1949 Legislature passed the Enabling Act which will allow the communities in which these institutions are located to use them for any other useful purpose when they are no longer needed for the care of the tuberculous. When this time arrives we believe that these institutions will make desirable homes for the aged, at a relatively low cost. For many years Nopeming Sanatorium in St. Louis County has furnished care for the tuberculous in the county with a population of slightly over 200,000. With the rapid fall in the mortality and morbidity rate in this county in the past five years, the Nopeming staff believes that it will be able to furnish treatment for a population of 500,000 in another five or six years. If this trend continues, it is quite possible that approximately 250 beds previously used for tuberculous cases can be turned over for the care of the aged. While the number of beds will not take care of the problem completely, it would be quite a help in many communities.

Dr. Walter P. Gardner, Saint Paul: I wish to express my appreciation to Dr. Lepak for his fine presentation of these problems. As chairman of the subcommittee on Chronic Hospitals of the State Advisory Council on Hospital Survey and Planning under the Hill-Burton bill, I wish to call attention to the following fact. The proposed program for chronic hospitals in the state of Minnesota, set forth on the slides which have just been shown, is correct. One should not get the impression, however, that this program is going to be carried out in the near future. In fact, there is no possibility of reaching the goals set forth within the next five years. It is very probable that these goals will never be reached. If any large part of this proposed program is to be carried out, the funds for so doing will have to come through taxes rather than through private subscriptions. This, however, does not alter the fact that the goals are worthy and that efforts should be continued at all times to secure as large a part of the program as possible.

Dr. Erling Hansen, Minneapolis: My remarks are more or less anticlimactic to this paper, but I couldn't help being struck with the percentage which Sangamon County, Illinois, showed in dependent or public aid because of blindness. In the picture section of a recent *Minneapolis Sunday Tribune,* there was a quotation from Dr. Benedict's speech before the National Society for the Prevention of Blindness, in which he called attention to the fact that many of these people are living longer and that eye conditions in the aged are increasing markedly. It is true that cataracts are primarily an affliction of older people; that is not blindness. But it causes a good deal of disability in older people. Glaucoma, which is one of the primary causes of blindness, is a major condition which we find increasing with increased longevity. Many of the people who have been kept alive by our modern treatment for diabetes have not been insured against diabetic retinopathy, with resultant poor vision or actual blindness. Also, people with hardening of the arteries have a certain amount of degeneration in the retina, not actual blindness, which still causes a good deal of disturbance of vision. Those are real problems, and the striking thing in the Sangamon County picture was that over 63 per cent of the people who were dependent on public aid were there because of blindness. It is very important.

Dr. Lepak (closing): I wish to thank the gentlemen for their generous discussion of the paper and I want to say to Dr. Gardner that the plan proposed for the next five years is subject to change each year.

* * *

The meeting was adjourned.

Wallace P. Ritchie, M.D., *Secretary*

STATES GET $47 MILLION IN GRANTS IN YEAR

Public Health Service annual report, released recently, shows grants to states totaled 47 million dollars for year ended July 1, 1949. The breakdown by millions of dollars is: general health, 11.2; venereal disease, 12.7; tuberculosis, 6.7; mental health, 3; cancer, 2.3. At end of year, thirty-five new hospitals had been built under the Hospital Construction Act, an additional 355 were under construction, and plans had been approved for 500 more.

Extensive mucosal destruction and ulceration from chronic ulcerative colitis with only a few inflammatory polyps.

IN COLITIS MANAGEMENT—In the constipation of spastic, atonic and even ulcerative colitis, the smoothage action of METAMUCIL is of proved value.

METAMUCIL® provides a bland, soft bulk with a tendency to incorporate irritating particles with the fecal residue and is thus a valuable adjunct in correcting the constipation and minimizing irritation of the inflamed mucosa. METAMUCIL is the highly refined mucilloid of a seed of the psyllium group, Plantago ovata (50%), combined with dextrose (50%).
